asking for grocery cards, as families are hoping to be able to purchase their own food and increase the quality and variety of food they receive.

- In Massachusetts, the state education agency's McKinney-Vento Education for Homeless Children and Youth program proactively addressed the barriers faced by children and youth experiencing homelessness to accessing Pandemic EBT. During the Fall, it became apparent that many new P-EBT cards had not been activated, and students were not receiving their vital benefits. Many of these students were identified as homeless. The state provided [specific guidance to homeless liaisons on P-EBT outreach](#), and encouraged using school addresses for youth and families who had no stable address. In Massachusetts' 2nd Congressional district, three McKinney-Vento grantees — Worcester, Leominster, and Greenfield — are providing the steady support that homeless families and students need, from food pantries in high schools, to resource navigators, to partnerships with housing authorities. The effort to ensure students are eating has helped identify other needs: including housing, clothing and tutoring.

These are just a few examples of how, in a very real way, public schools *are* the homelessness response and prevention system for the most vulnerable children, youth, and families. I urge Members to contact McKinney-Vento homeless liaisons in their districts, and hear the on-the-ground perspectives of those who are closest to the challenges, and the incredible promise of our nation's children, youth, and families without homes.

Recommendations

The scale of the current and future homelessness crisis — of rising evictions, of increasing natural disasters — means that we must build on the role of schools, and leverage their unique position in communities to meet the nutritional and other basic needs of children, youth, and families.

The federal government has not made this task easy. Siloed responses from different federal agencies create barriers that cause and perpetuate homelessness, and therefore cause and perpetuate hunger. A narrow understanding of homelessness as primarily if not exclusively a housing issue has also stymied holistic solutions. Schools see the tragic results first-hand. To remove these silos, and enhance school-based solutions that meet the comprehensive needs of families and youth, I offer the following recommendations.

- **Authorize and incentivize the use of public schools to deliver emergency rental assistance to prevent eviction.** If we can prevent homelessness, we can prevent hunger. But to do so, we have to take a hard look at delivery systems for our most vulnerable and mobile families and youth. The struggle to distribute emergency rental assistance (ERA) is a prime example of a potentially catastrophic failure of a critical delivery system. In many states and communities, ERA programs have been unable to process ERA applications and distribute assistance in a timely manner. The result is billions of dollars in unspent funds, while the ranks of families facing eviction and

experiencing homelessness grow. In trying to reach vulnerable families quickly and seamlessly, programs like ERA should leverage the nationwide, established system that is already in place and is well equipped to reach families in need: our public schools. Schools are uniquely situated to connect with the families they see every day; they have expertise in and ready resources for family-friendly communication and assistance. Yet inexplicably, schools are absent from the “Whole of Government” response to housing instability. While [some promising efforts exist](#), they are too few in number. And time is running out for millions of families: beginning on September 30, Treasury may recapture and reallocate excess ERA funds. Congress can help ensure renters and landlords in communities with poor-performing and low capacity ERA programs can still access emergency aid by redefining “eligible grantees” to include local educational agencies. Unfortunately, H.R. 5196, which passed out of the Financial Services committee yesterday, does not do this, and falls short in other respects. Even without legislation, Treasury could and should explicitly authorize local educational agencies to assist in the distribution of rental assistance, and incentivize ERA grantees to subgrant, contract, or otherwise create agreements with public schools to distribute rental assistance, leveraging the existing McKinney-Vento program and LEA homeless liaisons. Further, Treasury should encourage grantees to partner with schools to use Free Lunch eligibility as a categorical eligibility to meet the income requirements for ERA, and make families who are identified as homeless by schools (under the education definition of homelessness) categorically eligible for both motel stays and rental assistance. The “referral fatigue” experienced by families is real; to combat it, we must cut the bureaucracy and encourage direct assistance through trusted sources, such as public schools.

- **Fund the McKinney-Vento Act’s Education for Homeless Children and Youth (EHCY) program at \$800 million (the level included in the American Rescue Plan Act).** We must make sure the infrastructure is in place to help expedite assistance through public schools for families and youth experiencing homelessness. As I mentioned previously, school district homeless liaisons are currently on the front lines of the homelessness crisis — they provide an existing infrastructure to proactively reach our most vulnerable families and youth and make sure that they have healthy food. But liaisons and the homeless education programs they administer in school districts are limited in their capacity to identify, stay in touch with, enroll, and support children and youth experiencing homelessness. In the most recent fiscal year, [only 23% of LEAs received direct subgrants through the EHCY program](#), due to insufficient national funding. Appendix B of my testimony shows which LEAs in your districts received subgrants in the 2019-2020 school year. Without adequate capacity, schools will continue to under-identify and under-enroll children and youth experiencing homelessness, which in turn limits the participation of these children in school meals programs. Fortunately, thanks to a bipartisan amendment by Senators Murkowski (R-AK) and Manchin (D-WV), the American Rescue Plan Act (ARP) provided \$800 million for the identification, school enrollment, and support of children and youth experiencing homelessness — eight times the annual EHCY appropriations, allowing many more

school districts to participate in the program. The funds also may be used more flexibly than the EHCY program typically permits: ARP specifies that funds may be used for wraparound services to improve attendance. Congress should maintain at least this level of funding annually, as well as the flexible nature of the funds, to allow schools to expand their capacity for identifying and supporting children and youth experiencing homelessness.

- **Amend HUD’s Definition of Homelessness to align with that of the U.S. Department of Education.** The U.S. Department of Education, as well as federal programs such as Head Start, the Child Care and Development Fund, the National School Lunch Program, and the Runaway and Homeless Youth Act, define homelessness to include the hidden situations of staying with others temporarily or in motels (regardless of method of payment). The definition of homelessness used by the U.S. Department of Housing and Urban Development (HUD) for the most part only includes those on the streets or in shelters. As a result, the vast majority of the children and youth experiencing homelessness who are identified by public schools are not eligible for most HUD homeless assistance programs — even now, when staying with others in temporary, crowded situations places them at high risk for COVID-19 transmission and infection. So most children and youth experiencing homelessness don’t show up in HUD counts, and thus stay invisible, underserved, and underfunded. If we want to increase the ability of schools to help children and youth experiencing homelessness access shelter and housing, and thereby reduce their hunger, we must amend HUD’s definition of homelessness to align with schools and other child and youth serving agencies. Doing so would streamline referrals, leverage existing resources, and bring schools in as full partners.
- **Eliminate barriers to SNAP benefits for unaccompanied homeless youth.** At the other end of the age spectrum, youth who experience homelessness on their own, and who are minors - unaccompanied homeless youth — face unique barriers to accessing food assistance. Here, too, school district homeless liaisons are uniquely poised to help, but continue to report that unaccompanied youth face barriers to accessing Supplemental Nutrition Assistance Program (SNAP) benefits. In particular, youth are asked for documents that they cannot produce and are inappropriately referred to child welfare agencies. The U.S. Department of Agriculture should revise and reissue [its 2013 guidance](#) to clarify the definitions of “homeless” and “parental control” and that there is no minimum age for SNAP benefits. Further, revised guidance should clarify that State agencies must not condition the processing of an application or the receipt of benefits on a child protection report for any applicant, including applicants under age 18. Child protection reporting should be based on specific facts indicating abuse or neglect as defined by state law, of which the State agency has specific knowledge, and should not be predicated on the mere fact that the applicant is an unaccompanied homeless youth.
- **Amend Head Start and other federal early care programs to align with the McKinney-Vento Act by requiring the designation of homeless liaisons and the**

provision of transportation. Schools, of course, are not the only child-focused system in our communities. While the topic today is the role of schools in ending hunger, many young children, not yet school age, have dire unmet nutritional needs as a result of their homelessness. The U.S. Department of Education estimates that [1.3 million children under the age of six experienced homelessness in 2018-2019](#), but that only 10% were enrolled in a federally-funded early childhood program. If these children are not participating in quality early care programs, they are not likely to be connected to reliable, adequate sources of food. Despite improvements to the Head Start Act and the McKinney-Vento Act, young children who are homeless continue to be under-identified and under-enrolled, with lack of transportation continually cited as a top barrier. Head Start and other federally funded early childhood programs should be amended to align even more completely with the EHCY program by requiring designated homelessness liaisons and providing for transportation for homeless and foster children. By ensuring that there is a point person for homelessness identification and enrollment — a counterpart to the K-12 homeless liaison — and by ensuring the means to attend regularly, these two changes would increase participation and connection to a multitude of necessary services, including nutrition, for our nation’s youngest children without homes.

- **Ensure that families experiencing homelessness can access and maintain child care.** To help families experiencing homelessness gain and sustain employment sufficient to maintain both access to food and housing, they need child care. While the Child Care and Development Fund does contain provisions for the identification and enrollment of children experiencing homelessness, the cost of child care, lack of transportation, and poor outreach by child care providers still puts child care out of reach for families experiencing homelessness. Families experiencing homelessness who have the maximum subsidy still must pay out of pocket anywhere from \$40 - \$350/week. We applaud and support efforts to expand access to child care, including through the Build Back Better Act. However, the most vulnerable and low income families, including families experiencing homelessness, must first have stable and lasting access to child care before increasing supports should be directed to upper income families. Additionally, low income families should have access to the quality and choice that meet their needs. As provided for in the Child Care for Working Families Act, children who are found to be experiencing homelessness or are in foster care at the time of enrollment should remain eligible for child care until the child reaches the age of compulsory school attendance.
- **Fund mobility and other services to accompany housing vouchers for families, and transitional housing for unaccompanied youth and young adults who need it.** Households with children are more likely than households without children to have difficulty paying rent or mortgage, and are [at highest risk for eviction](#). Yet families with children are [a decreasing share](#) of federal housing assistance beneficiaries. Recent legislation, including the American Rescue Plan Act and the Building Back Better Act, contain significant investments in Housing Choice Vouchers as the purported solution to

family homelessness. Yet many school district liaisons report that there are no landlords willing to accept vouchers, or that lack of case management and other services set families up for failure, further reducing the pool of participating landlords, or trap them in impoverished neighborhoods without access to nutritious food. Rental assistance to families should include the option to access a full panoply of wrap-around mobility services that will help them move to higher opportunity neighborhoods with high-performing schools, as well as access to quality childcare, medical care, fresh food, and other necessities. These wrap-around mobility services, as contemplated by [the bipartisan Family Stability and Opportunity Vouchers Act](#), include recruiting more landlords to accept these vouchers, as well as pre- or post-move counseling, housing search assistance, assistance with security deposits, school enrollment assistance, and the provision of information to families about community-based supports. Many youth and young adults who experience homelessness on their own have deep and complex needs; therefore, an adequate service array must include longer-term and service-rich options — i.e. transitional housing — to help these youth sustainably overcome homelessness, and prevent future generations from experiencing it. [Transitional programs for youth and young adults are effective](#) and are an essential and core element of efforts to prevent and end youth homelessness. Yet this youth-focused housing is in short supply—or even absent—in many communities, and has been defunded by HUD. Congress should increase investments in the Transitional Living and Maternity Programs and other Runaway and Homeless Youth Act programming, while HUD should incentivize Transitional Housing for youth, young adults, and young families in its Notice of Funding Opportunities, in accordance with local needs and priorities.

In closing, I am sure that the goal of the Ending Hunger in America initiative is not to have well-fed homeless children and youth; and indeed, as long as child and youth homelessness is rampant, so too will be childhood hunger.

To those who would say that schools have their hands full right now, especially as they attempt to re-open, re-engage students, and close learning gaps created by the pandemic, I would say that there is no equity in education, there is no academic recovery, without responding to hunger and homelessness. It is experienced disproportionately by those who face numerous other health and education barriers: [students of color, students with disabilities, and English learners disproportionately experience homelessness](#). Homelessness also has profound educational consequences: the pre-pandemic (2018-2019) [national average graduation rate for homeless students was 67.8%](#). This is 12% below other low-income students (80%) and nearly 18% below all students (85.5%). [Students experiencing homelessness also scored lower than economically disadvantaged students](#) on statewide assessments by approximately eight to nine percentage points. Schools certainly can't solve these problems alone, but their insights, experiences, knowledge, and resources should be leveraged, and should also inform and shape agencies' policies — as should the lived experiences of our students themselves, who know better than any of us the potential of school and school-based services to change the trajectory of their lives.

“My high school had developed to be my home outside of the home, and this was the only place I could still control. After my mother passed and I was then left to face homelessness on my own, my school was the only place I had left... I spent 12 hours awake at school, doing school work, or thinking about my school consistently for months after. The only thing left important to me in this world was education, and I still had my home at school.”

—Ash P., SchoolHouse Connection Scholar and current college student

**Total Number of Students Experiencing Homelessness Identified by
School Districts in the Congressional Districts of the House Committee on Rules
School Years 2018-2019 and 2019-2020**

Challenges Facing Students Who Are Experiencing Homelessness

Students and families in Adams 12 Five Star Schools continue to struggle with the persistent challenges of poverty, unstable housing, and food insecurity on a scale never before seen. Youth experiencing homelessness face many barriers to gaining a quality education. The majority of students and families identified as homeless in the Five Star District are housed with friends or extended family in residences outside of Adams 12 boundaries, and families facing homelessness who do not have the ability to “double up” have to choose from the only available shelter options in Denver, Boulder, or Jefferson County. In either of these situations, students have to commute to school either on often inaccessible public transportation or rely on personal vehicles that are often in poor shape and therefore unreliable. These situations are exacerbated when students and families move among two or three “doubled up” situations or shelters while trying to navigate their housing options. Often if families feel that transportation is too cumbersome, they then transfer their student to a different school or district, thereby interrupting social connections and academic progress as the student attempts to familiarize themselves with yet another new routine, schedule, teacher, etc. Students who do actually make it to school on a regular basis still face many barriers in their education. These include stigmatization and stereotyping of what homeless students are capable of achieving as well as a lack of understanding by school staff of the chronic trauma that affects a student experiencing homelessness. Behaviors that may present as defiant, apathetic, or disrespectful often draw negative responses from adults as well as exclusionary discipline practices, alienating students who conversely need the strongest connections with adults at school and the most time in the classroom.

Additional Effects of COVID-19 Pandemic on Students Who Are Experiencing Homelessness

- Increased number of students living in cars because they were exposed to COVID-19 or were doubled up with people who had or had been exposed to COVID-19

- Significant impact on the ability to maintain strong and consistent connections with youth experiencing homeless, particularly Unaccompanied Homeless Youth
- Significant impact on attendance and grades due to lack of access to the necessary technology to attend classes, parents and guardians who struggled with knowing how to support their students in engaging remotely, families who were forced to prioritize survival over school, and overall student frustration with additional barriers created by the pandemic
- Increased transience and school mobility due to the loss of employment and housing
- Growing food insecurity and health concerns as families are left to make difficult choices about how and where their limited funds are used

Current Strategies in Adams 12 to Support Students Who Are Experiencing Homelessness

<u>Staffing - 9.75 FTE (6.75 funded by Medicaid, 1.0 funded by Title IA Set-aside, 2.0 funded by grants)</u>	
<u>Connections to Community Resources</u> <ul style="list-style-type: none"> ● Housing ● Medical and dental care ● Legal services ● Undocumented immigrant resources ● SNAP/EBT (food stamps) ● Basic resources ● School-based resource rooms 	<u>Direct Provision of Basic Resources</u> <ul style="list-style-type: none"> ● Food ● Clothing ● Shoes ● Hygiene items ● Laundry services ● Direct enrollment in Medicaid/CHP+ ● Student Health Assistance Fund (SHAF)
<u>Transportation Assistance</u> <ul style="list-style-type: none"> ● Gas vouchers ● RTD coupons/passes ● Private cars (rare) ● Re-routed yellow buses (rare) 	<u>Attendance Support</u> <ul style="list-style-type: none"> ● Partnership with Colorado Youth for a Change (CYC) to provide two AmeriCorps members ● Single Points of Contact (SPOCs) at each high school
<u>Academic and Social-Emotional Support</u> <ul style="list-style-type: none"> ● 1:1 tutoring with in-district teachers ● Credit recovery ● Summer school ● Technology ● Internet services ● School supplies ● Informal paired mentoring with trusted adults ● Purchase of graduation caps and gowns ● Frequent training for district and school staff 	<u>Wrap Services</u> <ul style="list-style-type: none"> ● Formal wrap service teams at McElwain Elementary and Coronado Elementary ● Close collaboration between SFOP and school administrators, mental health professionals, and SELS ● Close collaboration between SEI offices - Whole Child Initiatives, Federal Programs, Health Services/504, Intervention Services, PEAK/CCLC
<u>Post-Secondary Support</u>	<u>Recreational Opportunities</u> <ul style="list-style-type: none"> ● Athletic fees

<ul style="list-style-type: none"> ● Close collaboration between UHY Youth Advocate, Director of Counseling, Director of CTE, and the SWAP program ● Transportation to college and career fairs ● Assistance with completing ICAP Graduation Plan and FAFSA 	<ul style="list-style-type: none"> ● Advocacy with local businesses to offer reduced rates ● Passes to local rec centers

New Adams 12 Initiatives For 2021-22 to Support Students Experiencing Homelessness

- Host Home model for Unaccompanied Homeless Youth
- Partnership with Maiker Housing Partners (Adams County Housing Authority) to provide a more direct route to housing and rental assistance for Adams 12 families
- Partnership with Almost Home to support families with respite housing
- Expansion of 1:1 tutoring program
- Development and implementation of a formal mentorship program
- Expansion of Single Points of Contact to the middle schools
- Collaboration with new Wraparound Facilitators at Horizon HS, Legacy HS, Mountain Range HS, and Northglenn HS
- Addition of two new AmeriCorps members from Colorado Youth for a Change
- Addition of a Family Outreach Liaison for the Student and Family Outreach Program
- Expanded partnership with Kids in Need of Dentistry (KIND)

Successes

- Adams 12 is consistently recognized by the Colorado Department of Education as one of the most innovative and impactful homeless education programs in the state.
- 2019-20 saw the highest graduation rate for homeless students in Adams 12 history as well as the most quickly closing graduation gap of any subpopulation of students.
- Mobility rates and dropout rates for homeless students in Adams 12 have dropped significantly over the past decade.
- Training about McKinney-Vento law as well as the unique needs of homeless students is now a part of mandatory beginning-of-year training for all district and school staff.
- Support for students identified as McKinney-Vento is an unfunded mandate. Despite this barrier, the Adams 12 Office of Whole Child Initiatives has spent countless hours applying for various funding sources, bringing approximately \$1,500,000 in grant funds into Adams 12 over the past six years alone to support students who are experiencing homelessness as well as students who are involved in the child welfare system.

Continuing Challenges

- Locating ongoing funding to keep resource rooms stocked, particularly with non-food items such as hygiene products, household goods, and clothing
- Ensuring that families have access to fresh food, particularly for those who culturally do not eat a lot of the processed, canned, or boxed food that is typical to local food pantries

- Navigating the red tape linked to accessing federal emergency rental and mortgage assistance from local agencies
- Acquiring funds for respite housing (three-four week hotel stay while families who are in situational homelessness save for first, last, and deposit)
- Community pushback against safe parking initiatives
- Misunderstanding and misconceptions about youth homelessness and the adverse effects of being “doubled up”
- Despite our success in acquiring grant dollars, funding remains tight. In addition, the time and effort that goes into not only writing applications but then also managing the awarded funds is significant.

Our Primary Partnerships

A Precious Child	Colorado Department of Health Care Policy and Financing (HCPF)	Growing Home
Adams County Health Alliance	Community Reach Center	Joyful Journeys
Almost Home	Covering Kids and Families	Kids First Healthcare

Broomfield FISH	Early Childhood Partnership of Adams County	Mile High United Way
Center for Health Progress	Five Star Education Foundation	Rocky Mountain Partnership
Cold Weather Care	Food For Hope	Tri-County Health Department

Ardmore City Schools, Oklahoma

Ardmore City Schools, at this date, has identified approximately 35% more McKinney-Vento students who have enrolled for this school year. We are still enrolling students and doing outreach to let families know they can enroll their children even if they can't provide "proof of residency". Many of our families have lost housing, jobs and income due to the pandemic. Additionally, when screening at intake for McKinney-Vento, we are finding that 84% of our students have experienced trauma related to COVID-19 and events related to the pandemic, many with multiple traumatic events including death of a loved one.

The identifiable effects we are seeing so far are (each of these scored over 50% of respondents):

- Increase in anxiety, social anxiety, depression
- Mental health support needs for domestic violence, parent incarceration, neglect and abuse in the home
- Behavior issues with in-person instruction and school refusal behavior
- Attention seeking through outbursts
- Apathy

The requests from McKinney-Vento families for support and resources include (each of these scored over 50% of respondents):

- Counseling referrals
- Basic Needs: food, hygiene, clothes, health awareness
- Education Needs: school supplies, school clothing, payment or waiver of fees, EL service referrals, transportation to/from school of origin
- COVID testing and vaccination services
- Medical referrals - health, dental, vision
- Graduation planning - career/tech school and college planning guidance
- Assistance accessing social services such as SNAP, Soonercare, etc.

Key things needed in our community:

- Affordable housing
- Shelter space for families (including "family style" space for children of both genders)
- Transitional housing for unaccompanied youth with ability to check in without parental consent
- Job training for parents trying to return to work or get above the minimum wage/multiple job threshold

Our most pressing need in our district pertaining to all students is mental health care and affordable housing. We applied for and recently received Superintendent Hofmeister's School Counselor Corps grant through OSDE. Our program is just now being implemented and we hope to see a positive outcome. For our homeless students and families, through ESSER III funding, we hope to implement a wrap-around program to provide support for the entire family with a "care coordinator" who will facilitate access to social services. As for affordable housing, it is a well-known need in this area and as a school district, we are dependent upon the community meeting that need.

To address the role of schools in Oklahoma "ending hunger," Ardmore is truly blessed and lucky to have a grant through a private, non-profit, local organization that provides support for our district's supplemental food program. The Regional Food Bank of Oklahoma is the recipient of that grant support which provides us with the food resources required to allow our students in need to take additional food home for the weekends and holidays. So much goes into the coordination and provision of this service, which typically goes unnoticed, that it tends to be underappreciated. With the increase in SNAP benefits for our families, we are still experiencing a high demand for the program. On a side note, our district is 100% free/reduced but the need is still apparent.

If I could share one thing with any of the legislators it would be this: don't just visit with your constituents who contribute to your reelection campaign. Put boots on the ground and visit your local school district. Talk with your district's McKinney-Vento liaisons; witness, first-hand, what those of us who are trying to keep the strings from unraveling in our students' lives are doing on a daily basis. Ask the tough questions which have nothing to do with lobbyists and corporate interests but the health, both physical and mental, of those families and children you represent.

Poudre School District, Larimer County, Colorado

First of all, thank-you for making time to listen to stories and gather information on the issue of schools addressing hunger, and the intersection between homelessness, hunger, and the role that schools play in meeting the basic needs of our students.

Here in Poudre School District in Larimer County we see the hardship that poverty and homelessness causes our students on a daily basis, and the issue of food security and hunger are at the top of that list. When a family is living on the brink, or in the midst of, experiencing homelessness, every choice they make has consequences. Do you fill the fridge or pay the rent? Go without utilities or go to the grocery store? Repair the car that you rely on to make it to your minimum wage job, or use that same money to provide whatever food you can to get your children through the month and to the next paycheck, the next round of Snap benefits, or to the next day the foodbank pantry is open to the public. These are real quandaries that our families face on a daily basis, and often it's the kids that suffer.

Our schools play an integral role in keeping those children fed and healthy. Free and reduced lunch programs provide a healthy breakfast and lunch to students who otherwise won't eat, are forced to skip meals to stretch family budgets, and who often don't receive healthy meals at home even if they do have something to eat. It only takes one visit to a food bank pantry to realize the challenge families facing food insecurity encounter there. Food banks do an incredible job providing resources to the underprivileged, but they are limited by the donations they receive. Club crackers, day old pastries, Oreos and ramen noodles far outweigh available fresh vegetables, fruit, meat and dairy that makes for a healthy meal. And for our families experiencing homelessness, those often aren't an option even when they are available. Families living out of cars, in shelters, and in hotels and motels don't have places to store or prepare food, and their diets reflect that. Again, our schools are too often the only place where our homeless students get the nutrition they need to survive and to thrive.

There is also no question that our commitment to address food insecurity and hunger is inextricably tied to student success. Full bellies make for better students. And it goes beyond that. Not only does hunger itself cause students to suffer at school, the accompanying trauma and anxiety that comes with worrying about where their next meal will be coming from can overwhelm students of any age and create insurmountable barriers to education.

Here in Poudre School District, where we identified 1,313 K-12 students as experiencing homelessness during the 2020-2021 school year under the McKinney-Vento Homeless Assistance Act, we go to great lengths to combat student hunger in our schools. All McKinney-Vento identified students automatically receive free and reduced lunch status, and therefore healthy breakfasts and lunches in our schools, and we aggressively help families who are at risk of homelessness apply for free and reduced status as well. We also partner with the McKBackpack Program here in Fort Collins, a non-profit organization that distributes thousands

of pre-packaged family food bags to our schools weekly for children to take home to their families and help them keep kids fed through the weekend. And finally, our network of McKinney Advocates, McKinney Contacts, and Family Liaisons work tirelessly to connect families to community resources that address food insecurity, help families register for SNAP benefits, access district resources to provide grocery cards and other emergency aid to families who need it, and to identify students that have fallen through the cracks and aren't getting the food they need.

The Pandemic has only magnified these challenges. Shifts to remote and hybrid learning have been a challenge for all, but for our students that rely on schools as a primary source of food for their kids, it meant being faced with daily hunger and new stresses on budgets that were already broken. PSD acted swiftly, aided by federal COVID relief programs (thank-you!), opening school kitchens across our community to provide bagged breakfasts and lunches to any student and family that needed it, and mobilizing our transportation department to deliver bagged breakfasts and lunches to high needs neighborhoods where kids didn't have transportation to get to distribution centers. We also worked closely with McBackpack and the Larimer County Food Bank to provide additional food to fill empty pantries, and to help coordinate lunch distributions throughout the summer months when school was not in session.

It was, and has been, an incredible effort that so many in our district worked tirelessly to pull off. And it was an effort that made it glaringly clear how many students in our district would go without food if we weren't here to serve them, and how so many of these families fly under the radar during normal times, unseen in their struggle to put food on the table for their families.

Schools provide so much more than education to our students. We also provide community, support, connection, transportation, childcare, and yes – food, to the thousands of kids who walk our halls every day. As lawmakers it's important for you to know that, and for that reality to always shape the decisions you make, the laws you pass, and the assistance you provide.

Clinton Public Schools, Oklahoma

Children and unaccompanied youth experiencing homelessness face many challenges, and the COVID-19 pandemic has exacerbated those conditions. The combination of precarious living conditions, high mobility, and poverty create considerable educational, health, and emotional problems and barriers for such children and unaccompanied youth. In order to meet the needs of all homeless and unaccompanied youth, Clinton Public Schools has implemented a number of services to eliminate barriers and provide supports to our students.

Clinton Public Schools annually conducts a needs assessment as required under the McKinney-Vento Homeless Act. The local education agency's homeless liaison works with the school-based social workers, assistant superintendent, superintendent, site counselors, and site administrators to conduct the assessment and review the findings. During the annual budgeting process, the superintendent used the data to determine sufficient set-aside funds to meet the needs of all identified homeless students as well as to provide for further identification of students who qualify for services under the McKinney-Vento Homeless Act.

Clinton Public Schools successfully pursued Title 1, Part A McKinney-Vento subgrant funds and uses those funds to provide services to all identified homeless students. Provided services are coordinated by a team of local education agency staff who work together to meet the needs of all identified homeless students. The Care Team consists of school-based social workers, school counselors, teachers, school administrators, the local homeless liaison, and district-level administration. The team provides transportation to services, appointments, school, court hearings, and other necessary travel for homeless students. The team also provides appropriate clothing, including specialized clothing for homeless students to participate in educational programs, such as career-tech, uniforms or other appropriate attire for homeless students who participate in internships and work-study programs, and seasonally appropriate attire, such as jackets, coats, hats, and gloves, so that students can fully participate in all educational programs offered by the LEA and its partner organizations.

The Care Team partners with outside organizations, such as the Multi-County Youth and Family Services, the Oklahoma Regional Food Bank, local shelters, Red Rock Behavioral Health Services, Vocational Rehab, the Western Technology Center (Career Tech), and local physicians, optometrists, and dentists to ensure necessary wrap-around supports are provided appropriately and as needed. Clinton Public Schools also provides breakfast and lunch during school breaks and summers. All of the coordinated supports ensure that barriers to attendance, enrollment, and academic success are mitigated or removed. As a result of the district's emphasis on serving all students and ensuring each child has the necessary support to participate fully in the entirety of the district's curricular, co-curricular, and extracurricular offerings, the district has added two school-based social workers and three behavior specialists to the staff, developed site-based care teams, and applied for and secured additional funding specifically for the purpose of providing essential wrap-around support for homeless students.

Frederick County Public Schools, Maryland

The biggest challenging trend is identifying students who are experiencing housing instability. FCPS will be using ARP Fund 1 to hire a resource navigator who will have two directives: 1) to work within schools and communities to identify young people who are MV eligible and 2) to connect students/families with community resources and provide FCPS supports.

Regarding meeting the nutritional needs of families:

- * FCPS provides breakfast and lunch to all FCPS students free of charge. Supper and snacks also provided at certain sites.
- * Schools coordinate with the MD Food Bank to provide food drops on school premise.
- * Schools coordinate with community organizations to provide food drops, vaccines and fun at local school events.
- * FCPS provided systemwide summer school for the first time this past summer. All participating students received free lunch.
- * [Frederick County created the Food Distribution Food App](#): Super helpful for schools, students and families-when address is entered, all food drops are listed and what, if any, paperwork is needed.
- * Collaboration with Blessings in a Backpack to provide students with meals over the weekend-Students who are MV are automatics for BIAB.

Whole child supports to students:

- * Elevate Academy: Systemwide 5 week summer school for all students, all students who are MV were invited and encouraged to attend
- * Elevate Bridge: Provided approximately 4 check-ins to students who are MV over the summer. Staff communicated via phone, Google Meets and in person. Please see attached Guidance for more information.
- * New Horizons Summer Academy: Provides opportunity to earn 1 credit, job life skills and earn a \$600 stipend for high school students from 6 of 10 FCPS high schools. Funded by MV Grant
- * FAFSA Mentor Program: All seniors who are experiencing housing transition will have a FAFSA mentor who will be trained in completing the FAFSA, Classes/Programs offered at Frederick Community College and Frederick County Workforce Services with the goal of ensuring students complete the FAFSA, have a plan for post graduation and receive a soft hand-off to the that organization/institution from FCPS. This program is supported by both MV Grant and, hopefully, ARP Fund 2.
- * Shelter Therapy Program: Provides therapeutic supports by FCPS therapist and case management by FCPS case workers to students who are residing at Emergency Family Shelter. The goal is to connect students to therapeutic supports while in shelter as well as after shelter, connect students to three caring adults at school and provide case management to families. Funded by MV Grant.

Statement for the Record
Roundtable: Ending Hunger in America:
The Role of Schools in Ending Hunger and Improving Nutrition

Committee on Rules

U.S. House of Representatives

September 15, 2021

Enhancing CACFP for Equitable Access to Healthy Meals and Healthy Futures for Young
Children

Reynaldo Green, President, The National CACFP Forum
Vice-President of Nutrition and Family Well-Being, Quality Care for Children

Chairman McGovern, Ranking Member Cole, Rules Committee Members, and my fellow distinguished panelists: I am honored to have the opportunity to speak before you today. I am Reynaldo Green, President of the National CACFP Forum, a leading national CACFP organization working to strengthen and expand CACFP to underserved communities and to maximize the utility of CACFP to address the worsening inequities for children in the U.S. I am also the Vice-President of Nutrition and Family Well-Being, at Quality Care for Children, a statewide nonprofit child care organization and CACFP sponsor located in Atlanta, Georgia.

I sincerely appreciate Chairman McGovern, Ranking Member Cole, the Rules Committee's leadership and commitment to ending hunger both during COVID-19 and in normal times.

We are at a critical juncture to strengthen the Child and Adult Care Food Program (CACFP) through Child Nutrition Reauthorization. Strengthening and streamlining access to CACFP is fundamental to the success of Congressional efforts to expand quality child care to support working families. This will allow us to continue the original intent of the program: To address hunger and improve the nutritional well-being of millions of children in child care and afterschool programs across this country.

The CACFP Landscape

The Child and Adult Care Food Program (CACFP) uses federal dollars to provide nutritious meals and snacks to low-income children in child care centers, family child care homes and afterschool programs. CACFP is very important – both in terms of the number of children it serves and its positive impact on young children in child care. Nationwide, preschoolers are

consuming diets too high in calories, saturated fat, and sweets but regrettably too low in fruits, vegetables, whole grains, and low-fat dairy. The healthy food provided by CACFP, of course, makes a substantial contribution towards meeting the nutritional needs of children in child care, particularly low-income children. The program also helps to assure that children in child care receive good nutrition through ongoing training, technical assistance and support. CACFP is very critical to children's success when they transition to the meals offered in elementary school.

Food insecurity, poor nutrition and overweight and obesity disproportionately affects low-income children both before and during COVID-19. In the recent USDA report, the food insecurity rate for households with children was 15.3 percent. Existing inequities have been exacerbated by COVID-19, 21.7 percent for Black and 17.2 percent for Latinx households were food insecure in 2020. Intervening in early childhood and providing good nutrition and high quality child care programming is critically important to ensuring children are ready to learn when they enter kindergarten. By paying for these nutritious meals and snacks for eligible children enrolled at participating child care centers, family child care homes and afterschool programs, CACFP plays an important role in supporting working parents by both improving the quality of child care programs and also in making them more affordable for low-income parents.

In 2020, CACFP provided high-quality nutrition and learning experiences for over 4.1 million children in child care each working day: more than two-thirds of them in child care centers including afterschool programs, and the rest in family child care homes. Nearly \$3 billion in federal reimbursements for meals and snacks is distributed to child care centers and homes each year. The program plays a vital role in improving the quality and affordability of child care for many families with low-incomes. However, there are thousands of child care programs across the nation that do not participate in CACFP due to systemic barriers. Over half of the family child care homes operate without CACFP support for healthy meals. Although participation among child care centers has increased, not all eligible children have access to the program. In one study, researchers found that 60 percent of randomly sampled, non-participating centers were located in areas where the median household income was below the federal poverty level.

Many child care programs do not participate in CACFP because: (1) the benefits are inadequate; (2) the program is wrought with burdensome paperwork; and (3) the losses and penalties are too detrimental to child care programs that operate on razor-thin margins. The brunt of these barriers disproportionately impacts both communities of color and providers with fewer resources, contributing to gross inequities in child care quality and nutrition.

Child Nutrition Reauthorization Recommendations for CACFP

The Forum believes equity in CACFP can be achieved if we remove systemic barriers that often give advantages to better-resourced programs. The upcoming reauthorization of the child nutrition programs provides an opportunity to make much-needed improvements to increase

CACFP access and strengthen CACFP's role in supporting good health and nutrition through the following recommendations:

- **Allow child care centers and homes the option of serving an additional meal (typically a snack or supper), as was previously allowed.** National child care standards, based on the best nutrition and child development science, specify that young children need to eat small healthy meals and snacks on a regular basis throughout the day. Many children are in care for more than eight hours per day as their parents work long hours to make ends meet, so they rely on child care providers to meet a majority of their nutrition needs. Previously, child care providers could receive funding for up to four meal services – most commonly two meals and two snacks. Congress cut out one meal service to achieve budget savings. This penny-wise and pound-foolish step harms children's nutrition and health and weakens child care. We should restore CACFP support to the full complement of meals and snacks young children need and stop short-changing young children at a time when they, and their families can least afford it.
- **Allow annual eligibility for proprietary (for-profit) child care centers.** Many of these child care centers are small, independent "Mom and Pop" operations that provide much-needed child care and afterschool programs to low-income children in underserved areas. Proprietary child care centers are eligible to participate in CACFP if at least 25 percent of the children they serve are living in low-income households. Unfortunately, USDA requires these child care centers to document institutional eligibility *every month* rather than the *annual eligibility* allowed for other centers and homes. This creates unnecessary and substantial paperwork and administrative burdens.

No-Cost Recommendations:

- **Streamline program requirements, reduce paperwork, and maximize technology to improve program access.** This can be accomplished through a variety of proposals which will improve CACFP's ability to reach low-income families and improve equity by streamlining program operations, increasing flexibility, maximizing technology and innovation to reduce parent paperwork, and allowing sponsors and providers to operate most effectively. These include the following recommendations:
 - Modernize applications, eliminate normal days and hours on forms,

- Allow the use of electronic data collection and virtual visit systems following all the required federal CACFP standards, and
- Support sponsoring organizations' ability to mediate and fix problems through improvements to the serious deficiency process.

Reducing CACFP paperwork and rules will increase the power of CACFP to address inequity. When confronted with the complex CACFP paperwork requirements, many providers choose not to participate because they can't be assured of receiving reimbursements for their work and if they make paperwork errors the consequences can be severe. It is easier just to resort to serving cheaper, less nutritious meals and operate without the CACFP standards, oversight, and required paperwork. It is not uncommon for providers to forgo offering even the less costly meals and simply let children rely on food sent from home. Research has consistently shown that food brought from home is far less nutritious than the meals and snacks that children receive through CACFP.

The federal requirement for a CACFP specific additional enrollment form with normal days and hours in care has become a significant administrative burden and a barrier to participation in underserved communities. Requiring normal days and hours of care is based on outdated assumptions that parents work regular and consistent hours. Now, more than ever, many low income families work a wide variety of shifts which may change from week to week. Many states require forms to be updated to reflect each change, creating a paperwork burden for both the parent and the provider. There have been many cases where child care providers and sponsors have been required to payback substantial reimbursements for meals served and, in some cases, were terminated from the program, due to these outdated assumptions. If a child care provider is terminated from CACFP they are then barred from participating in a broad range of other government programs. This outdated and unnecessary requirement discourages participation by creating the risk of losing payment for healthy meals served to children in care and the risk of being terminated from the program losing the right to participate in a range of other important government programs.

Additional Cost Recommendations:

- **Make permanent the elimination of the area eligibility test to streamline access to healthy meals for young children in family child care homes.** Currently, under the COVID-19 waiver, all family child care homes qualify for highest reimbursement rate. This eliminates the usual area eligibility requirement that requires an area meet a 50 percent low-income threshold. This threshold is not an effective mechanism, it misses many providers serving low-income children. This is especially

true in rural and suburban areas which do not typically have the same pattern of concentrated poverty seen in urban areas. In addition, the area eligibility test completely bypasses providers and families struggling in high cost-of-living areas. Making the elimination of the area eligibility test permanent would bring more child care providers who serve low-income children into CACFP, and many more children in need would receive healthy CACFP meals and snacks.

- **Increase CACFP reimbursements to stem participation declines.** Cost is one of the most commonly cited barriers to providing healthier foods. Increasing the availability and consumption of fruits and vegetables, whole grains, and lower-fat dairy products among young children in child care is absolutely essential to improve development, promote health and prevent obesity at exactly the time – early childhood – when it can have the most long-term effect. This effort needs to be supported by adequate meal reimbursements. Higher reimbursements will assure that more children participate in CACFP, both attracting more child care centers and helping to stem the loss of family child care providers.
- **Enhance program reimbursements to support CACFP sponsoring organizations.** Sponsor’s administrative reimbursement rates should be brought to the level necessary to cover costs of administering the program. Access to healthy meals is threatened by the breakdown in the network of CACFP sponsors, the non-profit community-based organizations supporting the participation of family child care homes in CACFP. Many sponsors were unable to make ends meet due to high program costs and the loss of economies of scale as providers dropped out of the program, leading to a significant decrease in the number of sponsors in the last dozen years. Access to healthy meals particularly in rural areas, is threatened by the breakdown in the network of CACFP sponsors, the non-profit community-based organizations supporting the participation of family child care homes in CACFP.

CACFP During COVID-19

The National CACFP Forum wishes to thank Congress for the emergency funding to CACFP sponsors, centers, homes, and afterschool programs included in the American Rescue Plan Act. This funding will help cover operating-cost deficits that were created by shutdowns, as well as a shift in services, which occurred during the first three and a half months of COVID-19. This important provision in the American Rescue Plan Act is crucial to maintaining the infrastructure and financial viability of program operators and administrators. The value of the

emergency funds CACFP in the first three and a half months of COVID is worth approximately a quarter of a million dollars.

Emergency funding was vital based on the most recent data available from USDA that reveals during the first year of COVID-19 (March 2020 through February 2021), CACFP served 590 million fewer meals, a 30.5percent decrease, compared to the prior year . As a result, CACFP child care providers' reimbursements decreased by \$811 million (24.6 percent). Yet, CACFP remained a vital source of support for many children and their families by providing nutritious onsite and "grab and go" meals through helpful waivers authorized by Congress.

Conclusion

When children miss out on CACFP meals and snacks, it strains family budgets, contributing to food insecurity. To reach more families with CACFP and to strengthen its positive effects on good nutrition, quality child care, and supporting working parents, the National CACFP Forum urges Congress to act on our priority recommendations - improving the adequacy of benefits by allowing another meal or snack for children in a full day of care, making proprietary care eligibility consistent with other federal nutrition programs by allowing yearly verification, and eliminating overly burdensome and outdated paperwork - in addition to our other important recommendations including increased reimbursement rates for providers and sponsors, area eligibility, and making permanent area eligibility waivers..These changes are crucial to ensuring that children are ready to learn when they start kindergarten.

Our Mission

Chef Ann Foundation's mission is to ensure that school food professionals have the resources, funding and support they need to provide fresh, healthy, delicious, cooked-from-scratch meals that support the health of children and our planet. Scratch cooking gives schools the flexibility to run more sustainable meal programs to help fight climate change*, while also improving school nutrition so children can develop lifelong healthy eating habits.**

*Friends of the Earth, Scaling up Healthy, Climate-Friendly School Food (2018)

**Centers for Disease Control and Prevention (2015)

Our History

In 2009, Chef Ann founded the Chef Ann Foundation, a nonprofit organization dedicated to helping schools take action so that every child has daily access to fresh, healthy food. Also known as the "Renegade Lunch Lady," Chef Ann served for 11 years as the Director of Food Services for Boulder Valley School District in Boulder, Colorado. She is an internationally recognized author, chef, educator, public speaker, and advocate of healthy food for all children. In a nation where kids are born with shorter estimated life expectancies than their parents due to diet-related disease, Chef Ann has been a constant champion of school food reform as an important avenue through which to improve childhood nutrition.

Why School Food Matters

Improving school nutrition is not only a solution for health concerns, but social, academic, and environmental issues as well. American kids start their life-path in K-12 schools where they learn the skills necessary to thrive and meet their potential. While the country debates the best ways to teach them math, science, and English, we spend little to no time on food and nutrition.

As a result, school food has become increasingly more processed (heat-and-serve) and less healthy. With 31 million children eating school lunch every day and health issues like obesity, alongside a rapidly changing climate, this quickly becomes a national issue that needs to be addressed.

That's where scratch cooking in schools comes into play. Scratch cooking is real food with real ingredients. Scratch cooking enables schools to choose the ingredients, including those that are "Made in America", locally procured and/or produced using regenerative agriculture techniques, that go into students' meals.

Our Impact

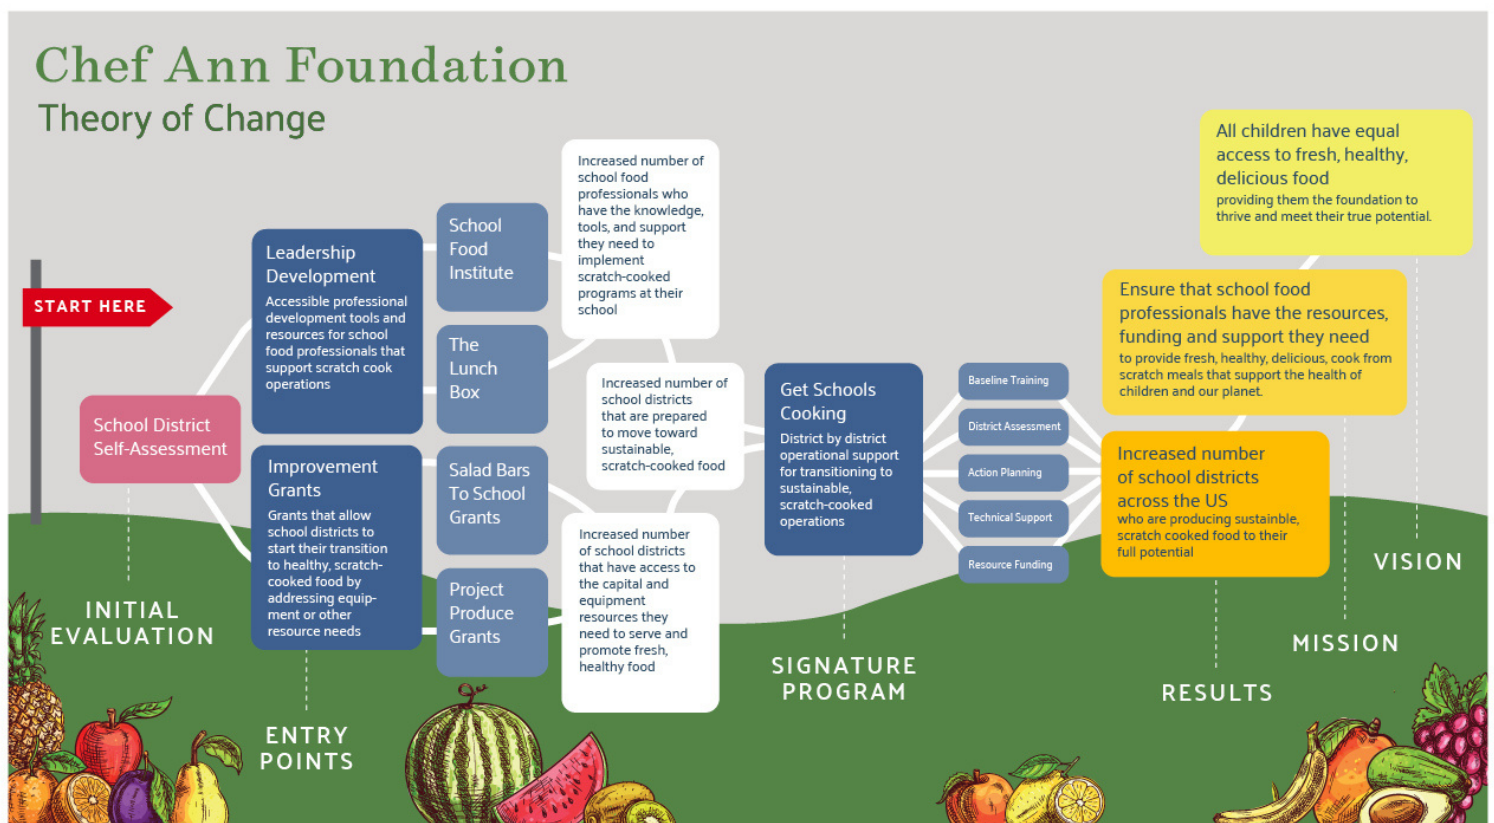

3,379,509 Children

13,365 Schools

25,186 Changemakers

Our Programs & Theory of Change

70% of the 30 million children who eat school lunch each day are eligible for the free and reduced-price lunch program. The food they are served is often heavily processed and lacking in fresh fruits and vegetables, leading to a myriad of long term nutritional and educational issues, such as diabetes and limited attention span. Our Theory of Change focuses on offering districts programming based on their needs and where they are at along the scratch-cook continuum.

Get Schools Cooking

A program that provides hands-on support through an assessment of school food operations, strategic planning, funding opportunities, and technical assistance, enabling school districts to increase their amount of scratch cooking.

The Lunch Box

An online resource that provides free step-by-step guides, tools, and recipes to help schools improve their food programs and transition to scratch cooking.

Salad Bars to Schools

A grant program that helps schools expand their commitment to serving fresh fruits and vegetables by implementing salad bars as part of their daily meal program.

School Food Institute

Online courses that give school food service professionals and childhood nutrition advocates the in-depth training, operational skills, and strategic vision necessary to make school food fresh, healthy, and sustainable.

SCRATCHWORKS

THE COLLECTIVE POWER OF GOOD FOOD IN SCHOOLS

ScratchWorks is a collective of school food professionals and organizations committed to supporting school districts in cooking school meals from scratch using whole, fresh ingredients that provide students with the nutrition they need for their educational success, health, and wellbeing.

Anneliese Tanner
Executive Director, Austin ISD Food Services and Warehouse Operations

Bertrand Weber
Director, Culinary and Wellness Services, Minneapolis Public Schools

Our Partner Organizations

Beyond the health implications, scratch cooking is a recipe for better learning. Good food is part of a good education—that's just smart. The obesity epidemic, generally poor nutrition among children, widespread food insecurity, and the environmental impact of processed food make this not just something that should be done, but something that must be done now, not later.

We've been held back by myths that scratch cooking is too hard or too expensive and the belief that kids just won't eat "quality food." We're about to change all that.

We are a coalition, led by and for School Food Service Directors, with a vision for what's possible and the collective expertise to bring that vision to life.

We are a movement sweeping across the country and gaining followers. We are empowering people and giving them the tools to go above and beyond what they're currently doing.

And we are a process, because school kitchens can't change overnight, but they will change over time.

March 30, 2022

The Honorable James McGovern
Chairman, Committee on Rules
U.S. House of Representatives
370 Cannon House Office Building
Washington, DC 20515

The Honorable Tom Cole
Ranking Member, Committee on Rules
U.S. House of Representatives
2207 Rayburn House Office Building
Washington, DC 20515

Dear Chairman McGovern and Ranking Member Cole:

Thank you for your leadership and ongoing focus on how enhanced access to nutritious foods can play a role in addressing the nation's most pressing public health challenges. In 1969, the first White House Conference on Food, Nutrition, and Health recommended that supplemental foods be provided to at-risk pregnant women and their infants.¹ As a program born from recommendations from the first White House Conference, the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) has delivered on the promise of the that Conference for nearly fifty years as WIC builds a healthier future for all Americans by providing effective, targeted nutrition support. The National WIC Association (NWA) is encouraged by the inclusion of \$2.5 million in funding through the fiscal year 2022 spending package and urges the Administration to swiftly convene a second White House Conference on Food, Nutrition, Hunger, and Health.

NWA is the non-profit education arm and advocacy voice of the Special Supplemental Nutrition Program for Women, Infants, and Children, the 6.2 million mothers and young children served by WIC, and the 10,000 service provider agencies who are the frontlines of WIC's public health nutrition services. WIC's effective combination of a healthy food prescription and nutrition education services, targeted to a crucial period of growth and development, has a demonstrated impact on health outcomes and is a model for strengthening nutrition security. For over three decades, NWA has worked to build bipartisan and broad-based support for WIC's programmatic goals and public health mission.

WIC stands at the intersection of food security and public health, providing a blueprint for targeted interventions that can promote improved nutrition and overall health as a means to address public health concerns. WIC reaches more than 6.2 million pregnant and postpartum women, infants, and children up to the age of 5, including approximately 44 percent of all infants born in the United States.² Strengthening nutrition security for WIC's targeted population yields dividends with time, especially as the nation increasingly grapples with a greater proportion of healthcare expenditures tied to chronic diet-related conditions. In 2018, the Government Accountability Office (GAO) estimated that Medicaid and Medicare spent more than \$207 billion to treat chronic diet-related conditions like diabetes, obesity, and cardiovascular disease.³ This constitutes approximately 15.3% of *all* Medicaid and Medicare spending.⁴ We are encouraged by recent, and historic, efforts by the U.S. Department of Agriculture (USDA) to elevate the importance of nutrition security and prioritize initiatives that will enhance access to healthy foods and improved dietary quality.⁵

Treasurer

Margaret Wigglesworth
Massachusetts
Interim President & CEO

Strengthening nutrition security and reducing disparities in access to healthy foods are essential steps in the effort to address major public health challenges and set up the next generation for public health success. WIC's food prescription – revised in 2009 to include fruits, vegetables, and whole grains – contributed to reduced rates of childhood obesity among WIC-enrolled toddlers⁶ and increased dietary quality and variety for young children.⁷ WIC has a strong record of breastfeeding promotion, improving initiation rates among WIC-enrolled infants by 30 percent since 1998.⁸ Maternal nutrition, especially prenatal nutrition, can impact the success of a pregnancy and reduce risk factors for maternal mortality or morbidity.⁹ WIC's nutrition intervention is associated with a 16 percent reduced risk of infant mortality,¹⁰ fueled by reduced risk of preterm birth and low birthweight.¹¹

To build on WIC's record of public health success, a second White House conference could play a catalytic role in clarifying and enhancing the linkages between nutrition and health systems. Thoughtful, whole-of-government approaches will reimagine WIC as a crucial part of healthcare delivery, building new systems that streamline certification for WIC services, enhance access to WIC's nutrition education and breastfeeding services, and wisely leverage WIC's public health nutrition workforce to meet the health and nutrition needs of the broader population. By engaging a broad range of stakeholders, a second White House conference could deepen existing partnerships and provide new perspectives between WIC and the healthcare and agriculture sectors as all stakeholders seek to build a healthier, more resilient nation.

Convening a second White House Conference on Food, Nutrition, Hunger, and Health will focus all elements of the food supply chain in a coordinated effort to stamp out hunger, enhance access to nutritious foods, and change the trajectory of Americans' health. Building on the legacy of the first Conference, which led to the establishment of WIC, we stand ready to assist the Committee and other federal stakeholders in preparation for a second Conference.

Sincerely,
National WIC Association

**Testimony of Luis Guardia,
President, Food Research & Action Center**

**U.S. House of Representatives
Committee on Rules
Hearings and Roundtables on Ending Hunger in America
March 30, 2022**

I. Introduction

Chair McGovern, Ranking Member Cole, and Members of the House Rules Committee. My name is Luis Guardia and I am the President of the Food Research & Action Center (“FRAC”). FRAC works to improve the nutrition, health, and well-being of millions of people struggling against poverty-related hunger in the United States through advocacy, partnerships, and by advancing bold and equitable policy solutions.

Thank you for giving me the opportunity to submit testimony as part of your series of Hearings and Roundtables on Ending Hunger in America.

These hearings and roundtables—unprecedented by the House Rules Committee—will pave the way for a diverse and inclusive White House Conference on Food, Nutrition, Hunger, and Health. The Committee has reached beyond the capital beltway to hear from state and local anti-hunger groups and emergency food providers; nonprofits representing children, veterans, immigrants, civil rights, older adults, workers, farmers, and others; education stakeholders, faith-based organizations, and experts with lived experience in hunger and poverty.

The Committee’s efforts to address hunger in America also have included site visits to communities across the United States. I had the privilege of joining you, Chair McGovern, on your visit to San Francisco and the Bay Area in August 2021. Through a series of visits ranging from a Palo Alto food pantry to a farmers’ market in the Tenderloin. I was able to witness inspiring and innovative work to address the struggles faced by people experiencing hunger in the midst of the COVID-19 economic and health crisis.

I was pleased to experience and engage with community leaders and see the importance of nutrition programs in action.

When we met a mother of four at the farmers’ market who struggled to put nutritious food on the table, I saw how meaningful additional food benefits were to her. There were so many other inspiring stories underscoring the need for adequate benefits and access to food with dignity that will stay with me forever.

These visits underscored the critical role the government plays in improving the health, nutrition, and well-being of families struggling with hunger. I saw how government action to strengthen and improve the reach of vital nutrition assistance such as SNAP, school meals, WIC, child care food, and other federal nutrition programs has been critical to struggling individuals and families. The other key observation is the proven stimulative effect on the economy.

We know that thousands of communities across the country continue to struggle to recover from the greatest economic crisis in 100 years. More needs to be done to address unprecedented food insecurity and the racial and economic disparities in food and economic security.

Of immediate importance is the need to address the worsening hunger cliff that looms when COVID-19 emergency health declarations end. On average, SNAP households in most states will lose \$82 in monthly SNAP allotments. FRAC's blogs, *A Strengthen SNAP Agenda to Address the Hunger Cliff*^{1,2} ([Part 1](#) and [Part 2](#)), include administrative and legislative actions to permanently strengthen SNAP benefit amounts and eligibility provisions. The blogs also lay out the necessary strategies to promote efficient and equitable SNAP access and good customer service.

Actions need to be taken to extend the waivers authorized by the U.S. Department of Agriculture ("USDA") that allowed schools, child care providers, and community organizations the flexibility needed to continue serving meals to children during this unprecedented time. This is why FRAC and more than 2,000 national, state, and local organizations representing every state across the country sent a letter³ to Congress urging that USDA be given the authority to extend the waivers. Without these waivers, the child nutrition programs would not have been able to adequately respond to the fallout from COVID-19. Throughout the pandemic, schools and community meal sponsors have relied on these waivers to keep children fed during short- and long-term closures, alleviate child hunger, advance racial equity, and child well-being. FRAC strongly supports House and Senate bi-partisan bills that have been introduced to extend USDA's waiver authority beyond the current deadline of June 30, 2022.

The pandemic only exacerbated an existing national hunger crisis. The anti-hunger community was extremely disappointed and frustrated that the Build Back Better Act stalled in the Senate. Provisions in this legislation would make historic gains towards eliminating childhood hunger and poverty. Congress must continue to provide investments in these programs in its next legislative vehicles.

We are at a pivotal moment in time. We must build on the lessons learned during the pandemic. Now is the time to convene a White House Conference that is focused on hunger.

To quote Chairman McGovern, "... hunger is a political condition. We have the resources, and we know what it takes. We just have to muster the will to end it." That political will has resulted in congressional support to secure funding for a convening of a White House Conference in 2022. This conference is a commitment that ending hunger in America is a national priority and creates a unique opportunity to leverage the political will necessary to implement bold, innovative, and multi-sector solutions that will address the underlying root causes of hunger and food insecurity.

II. Strategies to End Hunger in America

The pandemic has resulted in an increase in hardship, including more individuals living in households with food insecurity, and increased racial and ethnic disparities in food insecurity. COVID-19 has applied unique pressures to the relationships between hunger, poverty, and poor health, while hunger, poverty, and health have simultaneously increased the risk of COVID-19 transmission, infection, and morbidity. It is critical to understand how disparities in COVID-19 outcomes reflect distinct and interlocking causes across different groups of people. Policies enacted to spur recovery must account for these unique root causes and center leadership from members of systemically oppressed populations and communities. Tracking data about hunger, poverty, and health among these groups over the course of the pandemic is essential to ensure that recovery efforts are not ended too soon and leave them behind.

Across the country, governments and their nonprofit and private sector partners adapted the federal nutrition programs to meet increased need, while simultaneously adjusting their operations to align with public health guidance and to respond to changes in their ability to administer programs. Program participation during the first year of COVID-19 reflects the unprecedented levels of food and economic hardship during the pandemic. Several program expansions were critical for vulnerable groups and increased financial support for households.

Clearly, the nutrition programs are effective tools to address disparities in hunger, poverty, and health, and evidence from the pandemic indicates that they have been crucial resources in helping families get the nutrition they need. The federal nutrition programs are among our nation's most important, proven, and cost-effective public interventions, and further improvements can be made to support a more robust and equitable recovery.

Now is the time to build on the lessons learned by strengthening the federal nutrition programs and anti-poverty initiatives that will lead to an equitable economic recovery. We must:

Strengthen the Supplemental Nutrition Assistance Program (SNAP)

SNAP is the cornerstone of the nation's food security safety net, helping to put food on the table for 41 million low-income participants each month. When the number of families struggling to make ends meet increases, SNAP responds quickly and effectively to meet that need.

Research⁴ demonstrates the effectiveness of SNAP in alleviating poverty; reducing food insecurity; improving the health, nutrition, and well-being of children, adults, and older adults; reducing health care utilization and costs; and stabilizing the economy during downturns. Indeed, each \$1 in SNAP benefits during economic downturns generates between \$1.50 and \$1.80 in economic activity.

⁴ <https://frac.org/wp-content/uploads/hunger-health-role-snap-improving-health-well-being.pdf>

Nearly 43 million people participated in SNAP in September 2020⁵, on average, compared to nearly 38 million in September 2019. In addition, SNAP and Disaster-SNAP (D-SNAP) were responsive in multiple areas of the country recovering from natural disasters⁶ in the midst of the pandemic.⁷

FRAC has a number of policy priorities to strengthen SNAP as part of the nation's plan to eliminate hunger.

Boost SNAP Benefits:

Several temporary SNAP improvements have mitigated food hardship during the COVID-19 crisis. Many of those measures are tied to the Department of Health and Human Services (HHS) Pandemic Public Health Emergency Declaration (PHE). When that ends, it could result in a significant “hunger cliff” for millions of people. In addition to other relief that expires, most SNAP participants will lose on average \$82 a month in SNAP benefits.⁸

The federal government should continue to renew the COVID-19 PHE so long as conditions warrant. It also should provide for enhanced SNAP benefits to be triggered automatically with the onset of an economic recession or a health pandemic.⁹ Moreover, the federal government should ensure that Disaster SNAP tools can respond to pandemics, not only to natural disasters.¹⁰ The Pandemic Disaster Assistance Act of 2020 (S. 3534) that then Senator Kamala Harris introduced would have done that.

The federal government should increase SNAP benefits on a permanent basis¹¹ by:

- replacing the outdated Thrifty Food Plan with the Low Cost Food Plan¹² as the basis for calculating SNAP benefits¹³
- eliminating the cap on the SNAP shelter deduction¹⁴ to help families with children struggling to afford to both heat and eat¹⁵,
- increasing the SNAP minimum monthly benefit, and

¹⁵ <https://frac.org/blog/addressing-the-looming-hunger-cliff-improve-snap-deductions>

- making more widely available the SNAP Standard Medical Deduction for older people and people with disabilities.¹⁶

Eliminate Arbitrary Eligibility Barriers and Technology Barriers to SNAP Access

Arbitrary and harsh eligibility rules undercut access for many people who are struggling to make ends meet, have disparate impacts on particular groups, and are exacerbating racial and health inequities during COVID-19. U.S. citizens residing in Puerto Rico, American Samoa, and the Commonwealth of the Northern Mariana Islands are excluded from SNAP, which prevents them from receiving the same nutrition assistance provided to other people in America with low-incomes.

The capped Nutrition Assistance Program (NAP) block grant leads to more restrictive eligibility requirements, lower monthly benefits, and greater instability in nutrition aid for these individuals and families than is available for other Americans under SNAP, a major inequity.

- While there is a temporary suspension of the three-month SNAP time limit during the COVID-19 public health emergency, time limits should be eliminated permanently.¹⁷
- The special rules that prevent many otherwise income-eligible college students from qualifying for SNAP should be suspended during COVID-19 and lifted permanently.¹⁸
- The federal lifetime ban on SNAP benefits for convicted drug felons should be eliminated.
- The five-year bar that disqualifies many lawful permanent residents from receiving SNAP should be rescinded.
- Native and Indigenous communities should be allowed to access SNAP and Food Distribution on Indian Reservations (FDPIR) without having to choose only one.
- As Americans, Puerto Ricans and citizens of U.S. Territories deserve urgent and equitable food access and should not be subject to fewer benefits solely based on residency. As approved by the territories' leadership, the NAP should successfully transition to full participation in SNAP.

Improve Access Points for SNAP Customers to Obtain Food

- The SNAP Restaurant Meals Program (RMP) should be expanded to enable more SNAP participants who are 60 years and older, have disabilities, or are homeless to use SNAP to purchase meals from approved restaurants.¹⁹
- During COVID-19 and future pandemics, RMP should be allowed for all SNAP participants.²⁰

¹⁶ <https://frac.org/blog/addressing-the-looming-hunger-cliff-improve-snap-deductions>

¹⁷ <https://frac.org/blog/new-bill-would-permanently-eliminate-time-limits-on-snap-eligibility>

¹⁸ <https://frac.org/blog/key-barrier-to-snap-access-for-college-students-would-be-removed-under-new-bill>

¹⁹ <https://www.mdhungersolutions.org/pdf/mdhs-testimony-SB752.pdf>

²⁰ <https://panetta.house.gov/media/press-releases/congressman-panetta-senator-murphy-announce-legislation-expand-access>

- Hot prepared foods should be allowed for purchase with SNAP benefits.²¹
- Additional efforts are needed to make use of SNAP benefits more convenient, including by expanding online SNAP EBT to more authorized retailers.

Invest in Technology, Outreach, and Other Administrative Supports to Promote SNAP Benefit Access and Good Customer Service

- State administration of SNAP is underfunded. Since 1998, most states receive less than 50 percent reimbursement of the costs for SNAP administrative operations (e.g., older adults or people who rely on public transportation) or may not be able to easily access food retail outlets (i.e., “food deserts”). This has undercut their capacity, including for SNAP technology improvements and good customer service.
- The federal government should provide greater support for SNAP administration, including enhanced match-funding for SNAP technology and application-assistance initiatives.
- Enhanced funding streams for SNAP outreach can help get more eligible people connected with SNAP.²²

Bolster Child Nutrition Programs

The child nutrition programs (school lunch and breakfast, afterschool meals and snacks, summer food, WIC, and child care food) are central and essential tools for ending childhood hunger, improving health, and ensuring positive educational outcomes. These proven programs reduce poverty, prevent obesity, strengthen school and child care programs, and boost children’s health, development, and school achievement. They are among our nation’s most important and cost-effective public interventions, and they play an important role as the country recovers from the pandemic. In order to ensure that children can access the benefits of these programs, these programs must be bolstered in important ways.

School Meals Programs

The School Breakfast Program and the National School Lunch Program provide nutritious meals that support academic achievement, better attendance, and improved student behavior in addition to reducing childhood hunger. Before COVID-19, approximately 22 million children received free or reduced-price school lunch on an average school day, with school breakfast reaching just over half of the low-income students who participate in school lunch. These programs have tremendous educational benefits and should be protected and strengthened to improve access.

²¹ <https://meng.house.gov/media-center/press-releases/meng-rush-and-fitzpatrick-introduce-bipartisan-bill-to-allow-snap-to>

²² <https://frac.org/blog/prioritizingsnapoutreachjune2021>

When schools shuttered in the spring of 2020, school nutrition departments and community-based organizations quickly pivoted from school breakfast and lunch to provide meals to children through the Summer Nutrition Programs, which become available during unanticipated school closures. Even though there was a significant effort to open meal sites to give children access to meals, participation dropped dramatically from the previous school year. In April 2020, the first full month that schools were closed, lunch participation dropped by 43 percent, from 20.1 million children receiving free or reduced-price meals in April 2019 to 11.8 million in April 2020.²³

24

The innovative Pandemic EBT program was created during the pandemic to provide the value of school meals on an EBT card for families who lost access to free and reduced-price school meals when schools shuttered. From spring of 2020 to November 2021, \$43.7 billion in benefits have been provided to 37 million pre-school and school age children.

Moving forward, we must:

- **Provide school breakfast and lunch at no charge to all students.** Prior to the pandemic, the Community Eligibility Provision created in the Healthy Hunger-Free Kids Act of 2010 has allowed 1 in 3 high-poverty schools to offer free meals to all students, commonly called Healthy School Meals for All. During the pandemic, schools have been able to offer free meals to all students, which has given an opportunity for a trial run of Healthy School Meals for All, which has highlighted the value of the approach: All students have access to the nutrition they need to succeed in school; less administrative work for school districts; and no unpaid school meals fees. The White House Conference should explore strategies to move all schools to Healthy School Meals for All.
- **Increase the use of innovative school breakfast models by schools to expand access to school breakfast.** Participation in school breakfast has historically lagged behind school lunch. Most schools provide school breakfast in the cafeteria before the school day starts, which leads many students to miss out on a healthy meal to start their school day ready to learn. Breakfast in the classroom and other innovative programs that move school breakfast out of the cafeteria and make it part of the school day, combined with offering the meal to all students at no charge, is the best way to increase participation in this important program.

Out-of-School Time Programs

²³ <https://frac.org/wp-content/uploads/COVID-19-and-School-Meals-Participation-in-Spring-2020.pdf>

²⁴ <https://frac.org/wp-content/uploads/SchoolMealsReport2022.pdf>

Afterschool and summer nutrition programs provide nutritious meals to children after school, on weekends, and during school holidays and vacations at sites in low-income communities. The meals help draw children into educational and enrichment programs, and these programs will be critical equity supports as the nation recovers from the pandemic. Afterschool and summer meals reach only a small portion of the low-income children who participate in school lunch, which means that food insecurity goes up during the summer and children miss out on nutritious meals after school, on weekends, and during school holidays, and should be strengthened.

Participation in the Summer Nutrition Programs is historically significantly lower than during the regular school year, serving just one child lunch for every seven who participates in free or reduced-price school lunch during the school year.²⁵ Participation in 2020 was significantly higher than in July 2019 (which reflects summer participation prior to the pandemic). The increase in participation was due to the U.S. Department of Agriculture issuing a number of child nutrition waivers to support program operations during the pandemic, such as allowing any community to offer meals to families who needed them and allowing families to pick up multiple meals for their children.²⁶

FRAC would like to see policies that:

- **Expand access to healthy meals in afterschool and summer programs.** These programs are built on afterschool and summer programming, which will be critical as the nation responds to the educational impact that COVID-19 has had on children, particularly low-income children. By combining a large federal investment in afterschool and summer programs with the critical improvements of the child nutrition programs that are detailed below, the nutrition programs will support educational equity as well as combat childhood hunger and improve nutrition.
- **Invest in the afterschool and summer nutrition programs to expand children's access to meals when school is not in session.** For example, these programs should be streamlined to allow schools and other entities to operate one nutrition program. Currently, schools must operate CACFP in order to provide afterschool suppers instead of operating through the school nutrition programs; and summer food sponsors should be able to feed children year-round through the Summer Food Service Program. In addition, the area eligibility test for afterschool and summer meal sites is 50 percent, and it leaves out too many communities, particularly rural and suburban. The pandemic has highlighted the barrier that this threshold creates, and USDA waived the test so that all communities could provide meals through afterschool and summer nutrition programs. This approach should become standard

²⁵ <https://frac.org/wp-content/uploads/FRAC-Summer-Nutrition-Report-2020.pdf>

²⁶ <https://frac.org/wp-content/uploads/nationwide-waivers.pdf>

practice. Start-up grants and transportation grants (especially for programs in rural areas) are also essential.

- **Provide Summer EBT cards to low-income families.** The limited reach of the summer nutrition programs highlights the need for an approach to combat food insecurity, which goes up during the summer when school meals are not available to children who rely on them during the school year. Evaluations of Summer EBT and initial research on P-EBT (which provides the value of school meals on an EBT card to families who lost access to free or reduced-price school meals due to school closures related to COVID-19) show that this approach helps minimize food insecurity. The program also should provide benefits to cover the meals that families lose access to on school holidays and breaks and quickly respond to another pandemic or crisis situation that closes schools unexpectedly.

Early Childhood Nutrition Programs (CACFP and WIC)

The following administrative and legislative actions are designed to strengthen program access and support participation by underserved children and communities, ensure nutritional quality, and simplify program administration and operation. These actions should maintain and build upon the critical gains and lessons learned from the success of flexibilities that have been offered during COVID-19.

The **Child and Adult Care Food Program (CACFP)** provides nutritious meals and snacks for eligible children and elderly or disabled adults who are enrolled at participating child care centers, family child care homes, afterschool programs, Head Start programs, adult care centers, and homeless shelters. This program supports good nutrition, as well as high-quality and affordable child care, which helps children develop fully and supports working parents.

This drop in participation in CACFP during the pandemic reflects the increased caregiver burden placed on families with young children and adult dependents as a result of child and adult care center closures.²⁷

More must be done to reach children who are eligible for the program. Unfortunately, under the current rules, CACFP meals and snacks are out of reach for millions of young children in child care. Many child care programs do not participate in CACFP because (1) the benefits are inadequate, (2) the program is wrought with burdensome paperwork, and (3) the losses and penalties are too detrimental to child care programs that operate on razor thin margins. The brunt of these barriers disproportionately impacts both communities of color and providers with fewer resources, contributing to gross inequities in child care quality and nutrition. To achieve equity in CACFP, systemic barriers that often give advantages to better-resourced programs should be removed.

²⁷ <https://frac.org/research/resource-library/cacfpprogrambriefmarch2021>

- **Allow child care centers and homes the option of serving an additional meal service (typically a snack or supper) for children in full day care.** National child care standards, based on the best nutrition and child development science, specify that young children need to eat small healthy meals and snacks on a regular basis throughout the day. Many children are in care for eight hours or more per day as their parents work long hours to make ends meet, so they rely on child care providers to meet a majority of their nutrition needs. Previously, child care providers could receive funding for up to four meal services—most commonly two meals and two snacks. Congress eliminated one meal service to achieve budget savings. This penny-wise and pound-foolish approach harms children’s nutrition and health and weakens child care. We should restore CACFP support to the full complement of meals and snacks young children need and stop short-changing young children at a time when they, and their families can least afford it.
- **Allow annual eligibility for proprietary (for-profit) child care centers.** Many of these child care centers are small, independent “Mom and Pop” operations that provide much-needed child care and afterschool programs to low-income children in underserved areas. Proprietary child care centers are eligible to participate in CACFP if at least 25 percent of the children they serve are living in low-income households. Unfortunately, USDA requires these child care centers to document institutional eligibility *every month* rather than the annual eligibility allowed for other centers and homes. This creates unnecessary and substantial paperwork and administrative burdens.
- **Streamline program requirements, reduce paperwork, and maximize technology to improve program access.** This can be accomplished through a variety of proposals that will improve CACFP’s ability to reach low-income families and improve equity by streamlining program operations, increasing flexibility, maximizing technology and innovation to reduce parent paperwork, and allowing sponsors and providers to operate most effectively. These include the following recommendations:
 - Modernize applications, eliminate normal days and hours on forms.
 - Allow the use of electronic data collection and virtual visit systems following all the required federal CACFP standards.
 - Allow direct certification in all states.

Reducing CACFP paperwork and rules will increase the power of CACFP to address inequity.

When confronted with the complex CACFP paperwork requirements, many providers choose not to participate because they can’t be assured of receiving reimbursements for

their work, and if they make paperwork errors, the consequences can be severe. It is easier just to resort to serving cheaper, less nutritious meals and operate without the CACFP standards, oversight, and required paperwork.

- **Make permanent the elimination of the area eligibility test to streamline access to healthy meals for young children in family child care homes.** Currently, under the COVID-19 waiver, all family child care homes qualify for the highest reimbursement rate. This eliminates the usual area eligibility requirement that requires an area meet a 50 percent low-income threshold. This threshold is not an effective mechanism; it misses many providers serving low-income children. This is especially true in rural and suburban areas, which do not typically have the same pattern of concentrated poverty seen in urban areas. In addition, the area eligibility test completely bypasses providers and families struggling in high cost-of-living areas. Making the elimination of the area eligibility test permanent would bring more child care providers who serve low-income children into CACFP, and many more children in need would receive healthy CACFP meals and snacks.
- **Make permanent the expansion allowing young adults 18 to 24 years old to participate in CACFP at homeless and youth serving shelters.** Prior to the temporary expansion of benefits in the American Rescue Plan Act, youth serving shelters could not use CACFP because the program was limited to children under 18 years of age. By making permanent the CACFP age expansion implemented during COVID-19, youth serving and family homeless shelters could continue to rely on CACFP to serve healthy meals and snacks. CACFP is an important resource to support the efforts of the committed, hard-pressed, and often faith-based organizations working to care for this vulnerable population.

The Special Supplemental Nutrition Program for Women, Infants, and Children (WIC)

WIC is a vital program supporting good health for mothers and children, yet too many eligible families face barriers to WIC. The program provides low-income nutritionally at-risk pregnant women, postpartum mothers, infants, and children up to 5 years old with nutritious foods, nutrition education, breastfeeding support, and referrals to health care. Research shows that WIC improves participants' health and well-being, dietary intake, and birth and health outcomes; protects against obesity; and supports learning and development. WIC benefits are cost-effective, generating major savings in federal, state, local, and private health care, as well as special education costs.

During the first year of COVID-19, a monthly average of 6.3 million women, infants, and children participated in WIC, and redeemed \$2.3 billion in food purchases. This represents an overall increase in participation of 0.5 percent compared to March 2019-

February 2020, which includes a decrease in the number of women and infants participating but a 5.1 percent increase in the number of children participating.²⁸

Strengthening and expanding the WIC program will improve the food and economic security of participants by reducing food insecurity, helping to alleviate poverty, and supporting economic stability.

- **Make permanent the flexibilities that allow for remote enrollment, services and benefits issuance, and the facilitation of online ordering.** It is time to modernize and streamline the WIC program to enhance the WIC experience. It will be important to use the lessons learned from the success of the flexibilities that were offered through WIC waivers during COVID-19. Parents across the country are universally positive about being able to have WIC enrollment and services via phone, and remote benefit issuance. The successful waiver (dropping the requirement for in-person WIC clinic visits) has allowed participants to complete enrollment and education appointments from a convenient location over the phone. Far less common options for services have included video chats and telehealth systems. USDA should accelerate the progress made toward facilitating online ordering during COVID-19. Online ordering systems help WIC participants easily and conveniently choose the right nutritious WIC foods and avoid embarrassing encounters during the check-out process.

- **Fund comprehensive WIC outreach and coordination, including establishing a WIC community partners outreach program and an initiative to coordinate data in the health care and WIC sectors through technology.**
 - Establishing a WIC community partners outreach program, patterned on the successful SNAP outreach program, would fund WIC state agencies to contract with non-WIC community partners to conduct WIC outreach. Effective outreach by community partners can broaden the reach and effectiveness of WIC, which can help overcome barriers to WIC participation, including widespread misconceptions about eligibility, concerns by immigrant families, and limited access to information about WIC benefits and how to apply. WIC outreach needs to serve an increasingly culturally and linguistically diverse population and the new generation of tech-savvy mothers.
 - An initiative to coordinate data in the health care and WIC sectors through the use of technology will pay dividends. It is essential to streamline the current and often arduous options (fax or fillable PDFs) for health care providers to give patient's health information to WIC. This will help families enroll and maintain participation in

²⁸<https://frac.org/research/resource-library/one-year-of-wic-during-covid-19-waivers-are-vital-to-participation-and-benefit-redemption>

WIC by using the assessments (e.g., heights and weights) and blood tests (e.g., for anemia) already completed by their health care providers. In addition, data matching between Medicaid and WIC can be used as an outreach tool to successfully identify eligible but not participating families, and to streamline the income-eligibility process for parents.

- **Extend WIC certification periods to two years and enrollment for children until their sixth birthdays.** Extending WIC certification to two years will support the health of mothers and children with much-needed WIC benefits, healthy food, nutrition counseling, and referrals to services. The mothers and children who are eligible for the extension struggle with food insecurity and poverty — two conditions that make it difficult to maintain good health, nutrition, and overall well-being. The extension of certification periods and eligibility will help to retain families in WIC.
- **Update the WIC food package to be consistent with the 2020–2025 Dietary Guidelines for Americans.** The WIC food packages were revised in 2007 to align the authorized foods with the latest nutrition science at the time. Research shows that the revised WIC food packages have favorable impacts on dietary intake, breastfeeding outcomes, and obesity rates. In addition, studies suggest an important role for the WIC food package in improving neighborhood food environments, which benefits low-income communities. The new food package revisions should be consistent with the new Dietary Guidelines and National Academy of Science recommendations, including making permanent the current temporary enhanced levels of fruit and vegetables benefits, and investing significantly in the children’s package.

The investments in these proven nutrition programs must be centered on addressing the systemic racism and discrimination that perpetuate hunger, poverty, and its root causes and undermine equity and justice for all.

Address the Root Causes of Hunger and Poverty

As effective as the nutrition programs are, they cannot end hunger alone when employment and wages fall short, growth is not shared in an equitable way, and people lack access to affordable housing, health care, sufficient disability benefits, and other needed support systems. The interplay of these root causes and the structural racism that drives and exacerbates them help explain why hunger persists in America and why solving hunger must include job creation, wage growth, increased economic equity, sufficient government supports, and addressing systemic inequities.

While these conditions existed long before the pandemic, the health and economic crises laid bare and further deepened the inequities of our nation. The COVID-19 recession has been dubbed the most unequal in modern history with job losses from the pandemic overwhelmingly affect[ing] low-wage, minority workers most.”²⁹ Two years into the pandemic, while the economy is recovering, that recovery is not evenly felt when wages lag, prices for food and rents increase, and the vast majority of the growth goes to those who already have the most resources.

Critical investments to address the root causes of hunger and poverty include—but are not limited to:

Economic policies that promote good jobs, wages, and benefits for low- and moderate- income households: Needed actions include sufficient wages for struggling workers, enforcing wage and hour laws, ramping up public and private job creation, and job training that is effective and targeted to today’s economy. It also means investing in parental leave policies and child care supports that make work feasible for families. Closing educational gaps is critical to supporting the workforce of tomorrow and needed investment include expanding pre-k and post-secondary education/apprenticeships. It also means fixing our broken immigration system so that all workers have access to safe working environments, sufficient wages, and supports.

Government income-support programs for struggling families:

When families and individuals are unable to work—or work full-time because of unemployment, age, or disability, or whose earnings and benefits from work are not adequate to meet basic needs—the safety net must be responsive enough so their basic needs can be met. Nutrition programs alone cannot carry the whole burden of public anti-poverty and anti-hunger supports when employment falls short. When work, even with an increased minimum wage, a restoration of job growth, and other factors pushing up employment and wages, falls short of meeting the basic needs of tens of millions of Americans, even substantially improved SNAP, school meals, and other food programs—while able to greatly reduce suffering and boost economic security, health, and well-being—will not end hunger if acting alone.

Other essential safety net improvement strategies to help meet basic needs include:

- Making the [expanded Child Tax Credit](#)³⁰ changes permanent, more inclusive, and ensuring the benefits reach all eligible families.
- Improving and expanding other refundable tax credits for low-income families.

²⁹ Heather Long, Andrew Van Dam, Alyssa Fowers and Leslie Shapiro, “The covid-19 recession is the most unequal in modern U.S. history,” *The Washington Post*, September 30, 2020, www.washingtonpost.com/graphics/2020/business/coronavirus-recession-equality/.

³⁰ <https://frac.org/wp-content/uploads/FRAC-CTC-Primer-2022.pdf>

- Protecting and improving Social Security, Supplemental Security Income (SSI), and pensions for low-income older adults and people with disabilities.
- Supporting safe, accessible, affordable homes in neighborhoods that are free from discrimination and where everyone has equitable opportunities to thrive.
- Ensuring access to affordable health care.
- Improving the Temporary Assistance for Needy Families (TANF) program's eligibility and benefits rules.
- Increasing funding commensurate with the growing need for home-delivered and congregate meals provided under the Older Americans Act.

Target and Tailor Supports for Specific Populations with Disproportionate Rates of Hunger

Successfully addressing hunger in the U.S. includes ensuring that anti-hunger priorities and strategies focus on populations struggling the most, including children, women, people with disabilities, immigrants, older adults, LGBTQ+ people, struggling veterans, formerly incarcerated people, people experiencing homelessness, grandfamilies, and people residing in rural areas. Black, Latino, Native American, and Asian and Pacific American households have faced a long history of structural racism that has contributed to disproportionate rates of food insecurity that must be addressed head-on through equitable policies if we are to end hunger in America. The COVID-19 pandemic has both brought to light and deepened these pre-existing disparities. It is essential to center the work to address hunger on policies and strategies that most effectively support the groups that are at the highest risk of food insecurity.

Addressing Food Insecurity in Native American Communities

Far too many Native American households experience food insecurity and food access challenges. Almost half of Native American and Alaska Native survey respondents reported experiencing food insecurity during the COVID-19 pandemic, according to *Reimagining Hunger Responses in Times of Crisis: Insights from Case Examples and a Survey of Native Communities' Food Access During COVID-19*, a report released by the Native American Agriculture Fund (NAAF), the Food Research & Action Center (FRAC), and the Indigenous Food and Agriculture Initiative (IFAI) at the University of Arkansas. The study showed the importance of Tribal leadership, Native American agriculture, and food programs. There are a range of recommendations that should be central to the White House conference discussion and recommendations including the following.

- Support a robust Food Distribution Program on Indian Reservations (FDPIR) program with parity to other programs to help ensure equitable, adequate food access.
- Recognize Tribal sovereignty in administering Federal Nutrition Programs.
- Mandate and fund food security data collection and reporting for American Indian and Alaska Native peoples in the annual Current Population Survey Food Security Supplement and other government surveys.

In addition to recommendations referenced elsewhere in this testimony, additional specific recommendations that can help abate food insecurity among specific populations can be found in these FRAC publications:

- [Hunger, Poverty, and Health Disparities During COVID-19 and the Federal Nutrition Programs' Role in an Equitable Recovery](#)³¹
- [Comment from FRAC in response to USDA's request for information: "Identifying Barriers in USDA Programs and Services; Advancing Racial Justice and Equity and Support for Underserved Communities at USDA."](#)³²

Adopt Innovative Approaches to Value Creation

The inequities that existed before COVID-19 were amplified in hunger, economic equity, racism, and health disparities. In addition to strengthening programs that respond to hunger, this conference presents a once-in-a-generation opportunity for ideas to increase wealth creation and address hunger in low income communities.

Building on lessons learned in COVID-19 and new financing mechanisms that seek to create value and address social concerns, the conference can provide leadership to bring together members from a number of sectors such as technology, financial, social entrepreneurs, philanthropy and others to drive innovative ventures that create wealth for historically disenfranchised communities, increase quality, quantity, and access to healthy food, while creating value for other stakeholders and investors.

Many proven impact investment models can serve as a foundation for the White House to lead the U.S. and the world with solutions that simultaneously address hunger, health, poverty, and promote long-term economic security.

Work alongside states, localities, and nonprofits to expand and improve participation in federal nutrition programs

State and local governments, and nonprofit intermediaries need to build on the nutrition programs' considerable strengths and improve on-the-ground access to them. Even in the best performing states, participation rates in these programs often are not high enough, and low enrollment rates around the nation contribute enormously to the hunger problem.

The low participation rates result from a variety of factors. The differences in official attitudes, state and local processes, and results among the states are one reason it is so important to have even stronger federal programs with robust federal funding and clear national program rules. Whether or not a child is hungry—or is receiving good nutrition and is healthy and able to learn—should not depend on what state or county the child is born in, or moves to, or where she goes to child care, or which school she attends. Strengthening the national framework, therefore, is essential, but so is encouraging full

³¹ <https://frac.org/wp-content/uploads/COVIDResearchReport-2021.pdf>

³² <https://www.regulations.gov/comment/USDA-2021-0006-0408>

use of federal programs and available federal funds. Here are strategies to accomplish this:

- **Expand outreach and education.** State and local governments, foundations, and other private-sector stakeholders should increase public education and outreach efforts for nutrition programs, as they have done for health insurance and the Earned Income Tax Credit. This should include expanding support for nonprofit advocacy groups; food banks; immigrants', seniors', children's, and veterans' groups; and other direct-service providers that struggle to improve federal nutrition program participation.
- **Lower unnecessary and ill-considered state and local barriers to participation.** Too often states or localities put unneeded barriers in the way of struggling families participating in nutrition and other safety net programs. States and localities should eliminate processes that “churn” beneficiaries in and out of eligibility, as well as red tape and stigma-creating hurdles that the federal program rules do not require (and often actively discourage or prohibit). In addition, they should simplify access by using multi-program portals and certify eligibility across programs rather than unnecessarily using multiple applications for multiple programs. States need to revise office hours that are particularly hard for low-income working families to navigate as well as overhaul unnecessarily complex systems that are hard for anyone, much less struggling low-income people, to navigate. Many states have made real progress on these fronts in recent years, but far too many barriers remain.
 - **Provide performance and innovation bonuses.** Federal bonuses should be provided to reward states for excellent performance in operating federal nutrition programs, such as for reaching higher rates of SNAP-eligible people.
- **Buttress The Emergency Food Assistance Program (TEFAP), Commodity Supplemental Food Assistance Program (CSFP), and other supports for emergency food.** Expanding TEFAP and CSFP is an important step, although food banks are the first to point out that it is not a sustainable solution to the nation's widespread hunger problem. All families should have the resources from earnings, safety net programs, and other public supports to purchase the healthy food they need. Overwhelmed pantries and other charitable providers recognize that principle, and the need to focus their resources on emergencies and groups not reached even by a much-improved system of government program supports. Until the nation reaches that goal, however, these organizations will continue to play an important role, and will need more support to play that role.

III. Key Attributes for the White House Conference

More than 50 years have passed since the United States convened a White House conference and now—in the throes of the greatest hunger crisis in 100 years—is the time to demonstrate with actions that ending hunger in America is a national priority. FRAC stands ready to work with the administration, Congress, and a wide array of diverse stakeholders to again assemble with the imperative task of eradicating hunger and food insecurity in this country. The important lessons learned in the past two years have taught us that there is no time to waste.

The 1969 White House Conference on Food, Nutrition and Health, proved to be a catalyst for change, advancing policies and legislation that addressed hunger and nutrition needs at that time. Many of the policies and recommendations addressed at that conference are still in effect today, including key improvements to the Food Stamp Program, now the Supplemental Nutrition Program (SNAP), the School Breakfast Program, National School Lunch Program, and the Special Supplemental Nutrition Program for Women, Infants and Children (WIC). These programs remain a nutrition lifeline for struggling individuals and families. However, a fresh and deeper dive with a diverse array of stakeholders is needed to analyze gaps in federal programs and the impact of anti-hunger and anti-poverty policies. This review and analysis must be conducted through a 21st century lens—one that includes the impact of systemic racism and other inequities that have contributed to growing levels of hunger.

Now that \$2.5 million in funding has been secured for the conference in Public Law No: 117-103, the Consolidated Appropriations Act, 2022³³, FRAC supports the comprehensive approach that will include various federal agencies, state, local, and Tribal officials, anti-hunger, health and private sectors, and people with lived expertise of hunger. It is essential that the conference live up to its congressional mandate to examine the root causes of hunger and undernutrition and how they impact health and the prevalence of chronic disease. We support the comprehensive approach to utilizing existing and cross-departmental strategies while also considering new and innovative approaches to improving health outcomes by eradicating hunger, reducing the prevalence of chronic disease, and improving access to nutritious foods.

Again, FRAC is committed to supporting the convening and will devote its staff and expertise to provide the resources necessary to ensure the success of the conference in the upcoming months. In keeping with the statutory mandate of the conference to “identify current programming that directly or indirectly impacts food and nutrition insecurity and diet related diseases; specific statutory, regulatory, and budgetary barriers to ending hunger and improving nutrition and health in the United States; existing examples of coordination mechanisms between Federal agencies; Federal agencies and State, local, and Tribal governments; and all levels of government and

³³ <https://www.congress.gov/bill/117th-congress/house-bill/2471/text>

program implementers; and additional authorities or resources needed to eliminate hunger and improve nutrition and health,” FRAC has identified key attributes to laying the foundation for the conference’s success:

- **Leveraging political will:** A White House Conference creates a unique opportunity to leverage the political and public will necessary to implement bold, innovative, and multi-sector solutions that will address the underlying root causes of hunger and food insecurity. Such a comprehensive, national approach to ending the profound harms of hunger is foundational to efforts to improve our nation’s health, educational outcomes, national security, and economy and is essential toward creating a more equitable society.
- **Include a multi-sector convening:** The convening must be facilitated and led by the White House and developed in consultation with Federal, State, and local officials; anti-hunger, food supply, and health care experts drawn from across the country; and most importantly, involve stakeholders, experts, and individuals with lived experience of hunger and poverty. There should be a series of convenings throughout the country leading into the conference and efforts should be made to ensure that convenings are accessible to people who may have barriers, including transportation, language access, inability to attend because of job constraints, child care, lack of internet access, and mobility issues. Stipends need to be available to engage people with lived experience in hunger and poverty to cover not just travel and expenses, but time.
- **Address the needs of people struggling with hunger with solutions that build equity and dignity:** The conference, among other things, should address hunger at its core and should create a roadmap, develop policies, and enact legislation that will eradicate hunger and improve overall nutrition in this country. The conference should also examine the root causes of hunger and food insecurity, including how limited opportunities for economic mobility and other inequities have contributed to hunger, identify program gaps, and develop strategies across federal agencies. The conference should center those who are closest to the issue—people who have lived or living experience with hunger—and be guided by their expertise on the reasons for and how to solve hunger. These components are essential to creating a conference that lays the groundwork for our nation to successfully address hunger for the long-term, acknowledges that hunger is driven by complex and systemic factors, ensures agency and dignity for those who are struggling with hunger, and brings us closer to a nation where all people have the resources they need to thrive.

Thank you, again, for the opportunity to submit my testimony.

U.S. HOUSE OF REPRESENTATIVES
COMMITTEE ON RULES
EST. 1789 | JAMES P. McGOVERN (MA-2), CHAIRMAN

U.S. HOUSE OF REPRESENTATIVES
Committee on Rules

**ROUNDTABLE: “Ending Hunger in America: Examining Family Budgets
and Food Insecurity”**

October 13, 2021

Statement for the Record
Submitted by
The Kansas Food Action Network
for the hearing
Ending Hunger in America: Family Budgets and Food Insecurity
October 13, 2021

Chairman McGovern, thank you for the opportunity to submit this statement for the record on behalf of the Kansas Food Action Network. We are a statewide advocacy organization comprised of more than 30 local food, farm, and policy councils, and dozens of stakeholders building resilient local and state food systems in Kansas. Despite the fact 90% of land in the state is reserved for agricultural purposes, nearly half a million Kansans struggle to feed themselves. Perhaps no one knows better than Kansas that food insecurity has very little to do with the people who need to eat. Rather, food insecurity is the consequence of a system failing to work as it should. When a food system fails, the impact is disproportionately felt by low-income, vulnerable Americans in the form of hunger—the body’s biological response when it is unable to consume enough nutritionally-dense food. These impacts can be further exacerbated by competing household costs which push food security even further out of reach for low-income Americans.

Synthesizing the nuanced experiences of millions into a singular, poignant narrative that is accessible to someone who has never experienced food insecurity is a daunting task for an advocate. Therefore, although this testimony is offered under my professional title, I would like to use this opportunity to speak not from a position of subject matter expertise, but from the perspective of someone with lived experience regarding the matter before this committee.

Several years ago, before I was the director of a statewide food system advocacy organization, before I was named a Mitchell Scholar; before I held two masters degrees or was a first-generation college student, I was the eldest of three children in a two-parent household which sat just above the federal poverty line for the better part of twenty-five years. I no longer live under such grave financial restrictions; however, my journey out of food insecurity is not the rule, but the exception. The reality is, I should not be in the position I am, a position that allows me to be invited to submit this testimony. The odds were against me, as they continue to be for millions of Americans currently living in the clutches of hunger and despair.

While my siblings and I were young, my family received benefits from the Women, Infants, and Children (WIC) program and supplemented them with assistance from our church food pantry. Although we likely would have qualified for most of my childhood, the only instances in which my parents applied for SNAP benefits coincided with the two times we were evicted: once when I was a toddler, and again on the day I left for college.

During this 16-year gap between our receipt of SNAP benefits, I experienced first-hand the profound effect competing costs (both fixed and emergency) had on the food my family consumed, and how it was prepared.

As in many food-insecure homes, meals in our home were based on what was available. Moreover, cost, ease of preparation, and quantity produced consistently took priority over the nutritional benefits of food. As such, we relied on the inexpensive, highly processed staples one might expect (ramen, boxed macaroni and cheese, etc.). If it could be purchased for under \$1.00 or found at a store within walking

distance from our home, it was a dietary staple in our home. This was especially important with only one car to a family of five. When my parents had time, they channeled their culinary prowess into making large batch meals out of relatively few ingredients. Potatoes would often replace protein or could be used to increase the size of the recipe, stretching it over multiple meals.

Although many low-income Americans only have access to a hotplate or microwave for cooking preparation, my family was fortunate to have access to a stove, oven, and microwave. However, on the frequent occasion that the utilities had been turned off due to non-payment, the most budget-friendly option was to purchase a \$25 tank of propane to power an old outdoor grill. The grill could be used to cook or bake most anything our electric oven could prepare. If the gas had been turned off, the grill could also be used to boil water for bathing, cleaning clothes, or washing dishes.

In 2008, right about the time my family started to feel the economic impact of the Great Recession, I became of legal working age. I applied and was hired at a local ice cream store that was within walking distance of home and school. Almost immediately, my paychecks went to helping make ends meet at home. For a period of several months during my senior year of high school, it was the only income we had. As such, I began making the choice to skip my last two classes of the day to get a few more hours on the clock at work. It was an untenable strategy, however, that led to detention and threats of delayed graduation. Conversely, it did little to close the financial cavern we were experiencing at home. Towards the end of summer, I went grocery shopping one evening after work. Having just been paid, I had \$600 to divide between \$2,500 worth of past-due household bills, groceries, and gas money to drive myself to college the next week—an impossible situation for anyone, regardless of age.

After starting college, a feat made possible by a full-ride scholarship for which only low-income, first-generation students were eligible, I worked three jobs to support myself and assist my family back home who, having had not yet resettled from our recent eviction, were living in a friend's trailer home with no heat. Meanwhile, on the infrequent occasion I ate lunch with friends in the college cafeteria, I watched plates of uneaten food be dumped into bins and remembered the times my family had made bean burritos stretch for a week until pay day. Although my scholarship paid for a meal plan, I rarely made use of it as my rigorous work schedule overlapped with dining hours. With little extra money to pay for food, I relied on coping strategies that had followed me through adolescence: filling up on water, chewing mint gum, and investing in weight loss tea to suppress hunger hormones and get through the day. Years later, while conducting research for my masters thesis on food insecurity among college students, I found these, and other, strategies are shared among college students who were experiencing food insecurity. (Klugesherz, 2017).

During my sophomore year of college, my introductory level political science class included a unit on safety net programs. I listened to my professor define and review the details of SNAP, WIC, and TANF, and then attempt to spark the age-old discussion about the role of government in the lives of the poor and hungry. As the conversation took off, I found myself paralyzed, terrified that speaking up about the reality of being poor in America would label me as one of "*those people*" who, in the opinion of my classmates, "*haven't worked hard enough,*" have "*made poor choices,*" or "*need to learn how to get through life like everyone else.*" That day, I let my classmates define my character and make judgements about my worth as a human being. I sat silent as they made policy recommendations based only on their ability to navigate the world unimpeded.

Had I spoken up in class, I could have told my peers how my mom worked two jobs to afford the public transit bus pass which allowed my sister and I to participate in a magnet program at a junior high 45-

minutes away. I would have shared how my dad studied for his real estate license in a garage filled with bags of family trash (because trash pickup was a luxury) only to have the 2008 recession render his efforts moot. I would have told my peers about *decision fatigue*: the utter exhaustion experienced by low-income families who are forced to make a risk-benefit analysis about every step they take:

“If I eat this meal now, I won’t have it tomorrow when I need to be able to think for that meeting.”

“If I take that promotion at work, my pay will only go up by \$50 a month, but I’ll lose my SNAP benefits which are \$200 a month. It would be better long-term, but how do I feed my family in the meantime?”

“I can’t buy food that needs to be refrigerated or prepared because the power will be turned off tomorrow, so I will just bring the kids fast food for dinner this week. I won’t be able to buy much next week, but at least they’ll be fed.”

That which requires little-to-no thought or effort on behalf of a middle-class family requires the utmost planning and attention by low-income Americans. It may be overwhelming to members of this committee when considering the numerous variables that can intervene and prevent one from achieving food security. I challenge you to take that perspective and put yourself in the position of someone who, like my family, may only be able to see a few hours in front of themselves due to the emotional and financial pressure of living in survival mode.

As this hearing has made abundantly clear, hunger and food insecurity do not exist in a silo. These challenges demand a multi-sector, collaborative approach. We ask for continued support for the nutritional safety net – such as **SNAP, WIC, TEFAP** and **CSFP** – but we also urge this committee to consider the role programs and policies outside the purview of the Department of Agriculture can play in addressing food insecurity in America. Furthermore, we ask this committee to reframe its commitment from addressing *hunger* to addressing *food insecurity*. This distinction is critical because attempts to address hunger will inevitably result in temporary solutions. Vital, life-saving solutions, but nonetheless temporary. By addressing food insecurity, the focus moves away from triage and towards examination of root causes. Finally, we will begin to develop long-term, systemic, resilient solutions. The health, safety, and prosperity of our country depends upon it.

Respectfully Submitted,

Miranda Miller-Klugesherz
Director, Kansas Food Action Network

Testimony of Sarah Saadian
Vice President of Public Policy at the National Low Income Housing Coalition
Before the House Rules Committee
“Ending Hunger in America: Family Budgets and Food Insecurity”
October 13, 2021

Chairman McGovern, Ranking Member Cole, and members of the Committee, thank you for the opportunity to participate in this roundtable on the intersection of housing and food insecurity. I am Sarah Saadian, vice president of public policy at the National Low Income Housing Coalition (NLIHC).

NLIHC is solely dedicated to ensuring the lowest-income people in our country have safe, accessible, and affordable homes. NLIHC’s members include residents of public and assisted housing, people experiencing homelessness and other low-income people in need of affordable homes, housing providers, homeless services providers, fair housing organizations, state and local housing coalitions, public housing agencies, faith-based organizations, and concerned citizens. While our members include the spectrum of housing interests, we do not represent any segment of the housing field. Rather, NLIHC works on behalf of and with people with low incomes who receive or need federal housing assistance, especially extremely low-income people and people who are homeless.

The ongoing COVID-19 pandemic and economic collapse of 2020 devastated millions of families; just a few days ago, our nation reached the tragic and once unthinkable milestone of 700,000 COVID-19 related deaths.¹ Decades of structural racism in health, housing, food security and other systems have left Black, Latino, and Indigenous people disproportionately likely to experience food and housing insecurity, and disproportionately likely to contract COVID-19, be hospitalized, and die during the pandemic.² While Congress provided desperately needed resources to households experiencing a sudden job loss or drop in income because of the pandemic, many – particularly the lowest-income households and Black and Latino households – still struggled to keep food on the table and a roof over their heads.^{3,4}

Even before the pandemic, the country was in the midst of an affordable housing crisis that threatened food security for millions of households. NLIHC’s annual report, *The Gap: A Shortage of Affordable Rental Homes*, documents the severe shortage of decent, accessible, and affordable homes for extremely low-income people. Pre-pandemic, there was a shortage of nearly seven million affordable and available rental homes for America’s lowest-income renters earning less than the federal poverty rate or 30% of their area median income (AMI). For every 10 of the lowest-income renters, there are

fewer than four homes affordable and available to them. Without affordable options, nearly ten million of the lowest-income households were severely housing cost-burdened pre-pandemic, spending more than half of their incomes on rent and utilities.⁵

When households pay most of their limited incomes on housing, they have few resources left over to pay for groceries, healthcare, and other basic needs. As Pulitzer Prize winning author and Princeton sociologist Matthew Desmond explains, “the rent eats first.”⁶ Severely housing cost-burdened renters are 23 percent more likely than those with less severe burdens to face difficulty purchasing food.⁷ Food and housing insecurity can have particularly harmful effects on young children, with long-term consequences that can last into adulthood. Children in families experiencing food and housing insecurity are more likely to experience poor health outcomes, including developmental delays, behavioral problems, and chronic health conditions.⁸

Federally subsidized housing programs have been found to improve both housing stability and food security for households with low incomes. For example, a study conducted in New York City found that families able to spend no more than 30 percent of their income on rent increased their discretionary income by as much as 77 percent, leaving more room for these families to purchase nutritious food and other necessities.⁹ A long-term study found that children living in subsidized housing were more likely to be food secure, less likely to be seriously underweight, and more likely to be classified as “well” on an indicator of child health than children on the waitlist for subsidized housing.¹⁰

Affordable housing projects and community institutions can also be important allies in the fight against food insecurity. Neighborhood gardens and farms, community-supported agriculture and fresh food programs, and local farmers markets can help increase access to fresh, nutritious foods in historically underserved areas.¹¹ Affordable housing projects can play a leading role in educating community members through nutrition and cooking classes and can help decrease the cost of food for residents through bulk purchasing collaboratives.¹²

In Illinois, community organization Respond Now provides immediate, short-term food and housing assistance to families in suburban Cook County. Advocates at Respond Now help low-income households with applications for food assistance programs like the Supplemental Nutrition Assistance Program (SNAP), run food pantries and community gardens, operate temporary shelters for households facing homelessness, and administer mortgage, rental, and utility assistance.¹³ In addition to advocating for an end to homelessness and housing poverty,¹⁴ the statewide advocacy organization Empower Missouri created a Food Security Coalition to push for policies addressing the intersection of food and housing security, including streamlining assistance applications, and addressing food deserts in rural areas.¹⁵

In order to meaningfully address food insecurity, Congress must increase investments in long-term affordable housing solutions that target the underlying, structural reasons for our nation’s housing crisis, and advance the anti-racist policy and programmatic changes needed to ensure housing programs reach Black, Indigenous, and other people of color. By ending homelessness and housing poverty, Congress can ensure that households have enough resources to put nutritious food on the table and make ends meet.

More than ever, bold policies are needed to ensure that people with the lowest incomes and the most marginalized people have a stable, affordable home. NLIHC launched the HoUSed campaign earlier this year to achieve the large-scale, sustained investments and reforms necessary to ensure that renters with the lowest incomes have an affordable place to call home.¹⁶

The first – and best – opportunity to advance this agenda is through the Build Back Better Act, which currently includes:

1. \$90 billion to expand rental assistance to one million of the nation’s lowest-income households;
2. Preserving public housing for over two million residents through an \$80 billion investment to address the public housing capital repair backlog; and
3. Increasing the supply of housing affordable to people with the lowest incomes by investing \$37 billion to expand the national Housing Trust Fund (HTF).

In my testimony today, I will discuss the housing needs of people with the lowest incomes, the need to invest in vital, targeted affordable housing programs through the “Build Back Better Act,” and how doing so will help address not only the nation’s affordable housing crisis, but improve food security, advance racial equity, and improve health and educational outcomes.

Pre-Pandemic Affordable Housing Crisis

Even before the current COVID-19 pandemic, the country was in the grips of a pervasive affordable housing crisis, impacting rural, suburban and urban communities alike. While the crisis has many dimensions, a fundamental cause of housing instability is the mismatch between what people earn or otherwise have available to spend for their homes and housing costs. Rents have risen much faster than renters' incomes over the last two decades, and since 1960, renters' incomes have increased by only 5% while rents have risen 61%.¹⁷

The shortage of affordable homes is most severe for extremely low-income (ELI) households whose incomes are at or below the poverty guideline or 30% of their area's median income (AMI), whichever is higher. In Massachusetts, an ELI renter could be a family of four with two working parents who earn less than \$31,800 annually combined, a low-income senior with an income of \$22,300, or a single person with a disability relying on an annual income of just over \$9,500 from Supplemental Security Income (SSI). In Oklahoma, an ELI renter could be a family of four with two working parents earning less than \$20,100 annually combined, a low-income senior with an income of no more than \$14,000, or a couple with disabilities relying on an annual income of just under \$14,300 from SSI.

NLIHC's *The Gap: A Shortage of Affordable Homes* report demonstrates the shortage of affordable and available homes for households at different income thresholds – those with incomes at 30% of AMI (ELI households), 50% of AMI, and 80% of AMI. Data from this year's Gap report shows only 7.4 million affordable rental homes exist for the nation's 10.8 million lowest-income renter households, assuming they spend no more than 30% of their incomes on housing costs.¹⁸ However, only four million homes that rent at affordable prices for extremely low-income renters are available to them, leaving a shortage of 6.8 million affordable and available homes for renters with extremely low incomes. Put another way, only 37 rental homes are affordable and available for every 100 extremely low-income renter households (Figure 1).

¹⁷ Joint Center for Housing Studies of Harvard University. 2018. *The State of the Nation's Housing*. Cambridge, MA: Author. Retrieved from: <https://www.jchs.harvard.edu/state-nations-housing-2018>

¹⁸ According to HUD, households spending more than 30% of income for these housing costs are considered to be "cost-burdened." Households spending more than 50% are considered to be "severely cost-burdened."

FIGURE 1: AFFORDABLE AND AVAILABLE RENTAL HOMES PER 100 RENTER HOUSEHOLDS, 2019

Source: NLIHC tabulations of 2019 ACS PUMS data. AMI = Area Median Income

In Chairman McGovern’s district, there are fewer than four affordable and available homes for every ten of the lowest-income households; in Ranking Member Cole’s district, there are fewer than three homes affordable and available for every ten extremely low-income renters. Across the country, there is no state or congressional district with a sufficient number of affordable, available homes for its lowest-income renter households (Figure 2).

FIGURE 2: RENTAL HOMES AFFORDABLE AND AVAILABLE PER 100 EXTREMELY LOW INCOME RENTER HOUSEHOLDS BY STATE

Note: Extremely low income (ELI) renter households have incomes at or below the poverty level or 30% of the area median income. Source: NLIHC tabulations of 2019 ACS PUMS Data.

The lack of homes affordable and available to households with incomes above 30% of AMI is driven by the insufficient number of homes for the lowest-income households. Figure 3 shows the incremental

change in the shortage or surplus of rental homes available and affordable to households of different incomes.

FIGURE 3: INCREMENTAL CHANGE TO SURPLUS (DEFICIT) OF AFFORDABLE AND AVAILABLE RENTAL HOMES, 2019 (IN MILLIONS)

Source: NLIHC tabulations of 2019 ACS PUMS data.

The shortfall of almost 7 million homes available and affordable to extremely low-income households accounts for virtually the entire shortage of affordable homes in the U.S. In areas where very low-income and low-income households have difficulty with housing affordability, it is principally due to extremely low-income households having to rent homes they cannot afford, spending over 50% of their limited income on housing and competing with higher-income families for that limited housing.

Because of the shortage of affordable and available homes, 10.4 million renter households are severely housing cost-burdened, paying more than half of their incomes towards housing. Of these severely housing cost-burdened households, nearly three-quarters have extremely low incomes.¹⁹ Combined, extremely low-, very low- and low-income households account for nearly 99% of all severely cost-burdened renters (see Figure 4).

¹⁹ National Low Income Housing Coalition. 2020. The Gap: A Shortage of Affordable Homes. Washington, DC: Author.

FIGURE 4: SEVERELY HOUSING COST-BURDENED RENTERS BY INCOME, 2019

Source: NLIHC tabulations of 2019 ACS

Decades of structural racism created tremendous racial disparities in housing and homelessness. Renters of color are much more likely to be housing cost-burdened: 52% of Latino renters and 54% of Black renters are cost-burdened, more than 10 percentage points higher than white renters.²⁰ Black Americans represent 13% of the general population but are 40% of people experiencing homelessness and more than 50% of homeless families with children.²¹ Native communities have some of the most urgent housing needs in the nation – 6% of homes on tribal lands lack adequate plumbing, 12% have inadequate heating, and 16% are overcrowded, compared to 1-2% of the general population, and 38% of Native households report being housing cost-burdened.²²

Severe housing cost burdens can have negative consequences for families' physical and mental well-being. Severely housing cost-burdened families spend 74% less on healthcare and 35% less on food than similarly poor households who are not severely cost-burdened; and poor seniors who are severely cost-burdened spend 75% less on healthcare.²³ These households forgo healthy food or delay healthcare or medications to pay the rent. In the worst cases, they become homeless.

²³ Joint Center for Housing Studies of Harvard University. 2019. The State of the Nation's Housing. Retrieved from https://www.jchs.harvard.edu/sites/default/files/reports/files/Harvard_JCHS_State_of_the_Nations_Housing_2019%20%281%29.pdf

Housing cost burdens make it more difficult for extremely low-income households to accumulate emergency savings. Without emergency savings, unexpected costs (such as car repairs, medical bills, etc.) or loss of income (such as reduced work hours) can cause households to fall behind on rent and face eviction. Data from the 2017 American Housing Survey (AHS) show that households in poverty with severe housing cost burdens are more likely to fall behind on rent payments and be threatened with eviction than poor households that are not severely cost-burdened.

Housing instability causes significant disruptions in critical services and economic stability. The lack of stable housing can disrupt the care given to chronically ill individuals, interrupt student learning, and decrease academic achievement.²⁴ Housing instability can also undermine economic stability by disrupting employment. The likelihood of job loss increases for working low-wage renters who lose their homes (primarily through eviction),²⁵ indicating that affordable housing and housing subsidies are foundational to employment and economic security.

NLIHC's *Out of Reach: The High Cost of Housing* report estimates each locality's "housing wage," the hourly wage a full-time worker needs to earn to afford a modest apartment. In 2020, the national housing wage was \$23.96 per hour for a two-bedroom apartment and \$19.56/hour for a one-bedroom rental. The average minimum wage worker must work nearly 97 hours per week (more than two fulltime jobs) to afford a two-bedroom rental home or 79 hours per week (almost exactly two full-time jobs) to afford a one-bedroom rental home at the Fair Market Rent. While the housing wage varies from state to state and county to county, in only 5% of all U.S counties can a full-time minimum-wage worker afford a one-bedroom rental home at Fair Market Rent.

It is not just minimum wage workers for whom rents are out of reach: the average renter in the U.S. earns approximately \$18.22 per hour, \$5.74 per hour less than the national two-bedroom housing wage. In 49 states, the District of Columbia, and Puerto Rico, the average renter earns less than the average two-bedroom housing wage.²⁶

This mismatch between wages and housing costs will continue. Twelve of the twenty largest occupations in the country, including home health aides, janitors, and food servers, provide a median wage lower than what is needed for a full-time worker to afford modest rental housing (see Figure 5).²⁷ With wages insufficient to pay for modest rental housing even when individuals work full-time year-

²⁷ Ibid

round, a brief furlough or loss of hours, as we have seen over the past year, can create debts that renters can never repay.²⁸

Declining Federal Resources

The shortage of rental homes affordable to the lowest-income people is caused by market failure and chronic underfunding of solutions. Without government intervention, decent and affordable homes cannot be reliably built, operated, and maintained at a price the very lowest-income workers, seniors, or people with disabilities can afford. The private market cannot on its own solve this persistent market failure. Government intervention, in the form of subsidies, is necessary to fill the gap between what people can afford and the costs of developing and operating rental homes. Congress has consistently underfunded housing subsidies such that just one in four households eligible for and in need of housing assistance receives any.²⁹

HUD’s budget has declined dramatically over the last ten years since the Budget Control Act (BCA) was enacted. Inflation-adjusted federal funding for public housing, housing for the elderly, housing for persons with disabilities, and other important programs has fallen precipitously since FY2010. Only funding for tenant-based and project-based rental assistance programs has modestly increased to keep up with the rising operating cost for previously authorized assistance (see Figure 6).

FIGURE 6: CHANGES IN FUNDING LEVELS FOR KEY HUD PROGRAMS (FY10 TO FY21)

March 2021. Adjusted for inflation.

Solutions: Priorities for the “Build Back Better Act”

Ending homelessness and housing poverty would have wide-reaching impacts beyond housing – it would increase food security, facilitate better health and educational outcomes, lead to safer, stronger communities, and help address the systemic racism that has for generations locked Black, Latino, and Indigenous people out of opportunities. In order to achieve these ambitious goals, Congress must advance anti-racist policies and significantly expand investments in affordable housing for America’s lowest-income and most marginalized households.

The House Financial Services Committee voted on September 14 to approve landmark legislation investing \$327 billion in affordable housing as part of the “Build Back Better Act,” including significant funding for the HoUSed campaigns top policy priorities: \$90 billion to expand housing vouchers, \$80 billion to make desperately needed repairs to public housing, and \$37 billion for the national Housing Trust Fund to build, preserve, and operate deeply affordable, accessible homes. The legislation is a once-in-a-generation opportunity to provide significant, targeted investments in affordable housing that, if enacted, could end homelessness in this country, repair public housing, and pave path to universal rental assistance.

As Congress invests robust resources into communities, it must also advance necessary reforms and improvements to ensure these investments undo the legacy of racism and discrimination rooted in our housing system.

Expand Rental Assistance to an Additional One Million Households

Rental assistance is a critical tool for helping the lowest-income people afford decent, stable homes, and avoid housing insecurity or homelessness, but 3 out of 4 households who qualify for rental assistance do not receive it because of chronic underfunding. Expanding rental assistance to meet the needs of all housing cost-burdened households is key to any successful strategy to solve the affordable housing crisis.

Housing Choice Vouchers (HCV) are a proven solution to homelessness and housing poverty. Vouchers help people with the lowest incomes afford housing in the private market by paying landlords the difference between what a household can afford to pay for rent and the rent itself, up to a reasonable amount. Housing vouchers are flexible — for instance, families may use them to rent homes that best meet their needs, including in areas with higher performing schools and greater access to jobs and transportation. Housing vouchers may also be tied to a specific housing development in a way that facilitates the development’s financing and makes it easier for property owners to provide health and other services some people need.

Congress should include in any reconciliation package \$90 billion for an expansion of housing vouchers, an essential down-payment to eventually expanding vouchers to all those in need. To ensure greater racial equity, Congress must bar discrimination based on source of income (e.g., housing vouchers), sexual orientation, gender identity, and marital status.

Preserve Public Housing Infrastructure for 2.5 Million Residents

Congress must provide at least \$80 billion to preserve our nation’s deteriorating public housing stock, which are home to roughly 2.5 million of the nation’s lowest-income seniors, people with disabilities, and families with children, the majority of whom are people of color.

Public housing provides people with low incomes with affordable, stable homes, but Congress has underfunded public housing for decades – between 2010 and 2016 alone, Congress cut public housing funding by \$1.5 billion.³⁰ While Congress recently increased funding for public housing in fiscal years (FY) 2020 and 2021, overall funding for the program remains 13% lower than the FY10 funding level.

These decades of declining resources have threatened the quality and existence of public housing. With limited funding, many public housing agencies (PHAs) are unable to make needed repairs to preserve these homes. As a result, our country loses 10,000 to 15,000 public housing apartments each year to obsolescence or decay³¹ as other public housing units fall into deep disrepair, exposing public housing residents to hazardous and unhealthy living conditions, including lead, carbon monoxide, mold, asbestos, radon, and pest infestations. In 2010, the country’s public housing had a \$26 billion capital-needs backlog, which is estimated to grow by \$3.4 billion each year. Today, the funding needed to address capital repairs in public housing is estimated to exceed \$70 billion.³²

³² The “Transportation, Treasury, Housing and Urban Development, Judiciary, and Independent Agencies Appropriations Act of 2008” directed HUD to perform an updated Capital Needs Assessment for the public housing portfolio. (The previous assessment was conducted in 1998.) HUD selected Abt Associates to conduct the assessment, which was published as Capital Needs in the Public Housing Program (Contract # C-DEN-02277-TO001) on November 24, 2010. The assessment estimated total capital needs of the nation’s public housing portfolio in 2010 to be \$25,607,944,000. In addition, the assessment noted that “assuming that existing capital needs were completely addressed, each year approximately \$3.4 billion would be required to address the ongoing

Invest \$37 Billion in the National Housing Trust Fund to Build 330,000 Homes Affordable to Households with the Greatest Needs

To further expand the affordable and accessible housing stock, Congress should provide at least \$37 billion annually to the national Housing Trust Fund (HTF), a dedicated funding stream to efficiently build, rehabilitate, preserve, and operate rental housing for extremely low-income people. A one-time investment of \$37 billion in the HTF would support the construction and preservation of more than 330,00 rental homes affordable to people with the lowest incomes.

This investment would directly address a major underlying cause of the housing crisis – the severe shortage of housing affordable and available to people with the lowest incomes. Capital investments in the HTF can also be used to assist states and cities with acquiring hotels and motels to convert these and other commercial spaces into the permanent supportive housing needed to ensure stable homes for individuals experiencing homelessness.

Other Solutions

The federal government should incentivize or require state and local governments that receive federal transportation and infrastructure funding to reduce regulatory and zoning barriers that increase the cost of development and limit housing supply for all renters.

All federal investments to increase the supply of affordable rental housing must also require states and communities to affirmatively further fair housing. By fostering integration, Congress can make certain that renters have fair, affordable, and accessible housing options in all communities. Congress should also ensure that localities prevent the displacement of low-income and marginalized renters during development to allow long-term residents to continue to remain in their communities.

The Case for Targeted Federal Investments in Affordable Homes

Investing in targeted affordable housing solutions will improve lives and save the federal government money. Research clearly demonstrates that housing is inextricably linked to an array of positive outcomes in other sectors.

Food Security: When rent eats up an already limited paycheck, low-income families have fewer resources to buy adequate and nutritious food. Low-income families living in affordable homes experience greater food security and their children are 52% less likely to be seriously underweight compared to those who are cost-burdened by rent.³³

Health: Decent, stable, affordable homes are a major social determinant of health and are linked to better health outcomes throughout a person's lifespan. Children who experienced prenatal homelessness are 20% more likely to have been hospitalized since birth. Children who experienced post-

accrual needs, or on average \$3,155 per unit." Extrapolating the \$3.4 billion in accrual needs each year from 2010 until 2019, the capital needs backlog is currently estimated to be \$56.6 billion.

³³ Children's HealthWatch and Medical-Legal Partnership of Boston. 2009. Rx for Hunger: Affordable Housing. Retrieved from: <https://www.issuelab.org/resources/5379/5379.pdf>

natal homelessness are 22% more likely to have been hospitalized since birth.³⁴ In 2011, families living in unaffordable homes spent one-fifth as much on necessary healthcare compared to those in affordable housing.³⁵ When people have access to good affordable housing, primary care visits increase by 20%, ER visits decrease by 18%, and total Medicaid expenditures decrease by 12%.³⁶ Children's HealthWatch estimates that the U.S. will spend \$111 billion over the next ten years in avoidable healthcare costs because of housing instability.³⁷

Education: Student achievement is maximized when students can go home to stable, affordable homes. Low-income children in affordable homes perform better on cognitive development tests than those in unaffordable homes.³⁸ Low-income students who are forced to change schools frequently because of unstable housing perform less well in school and are less likely to graduate,³⁹ and continual movement of children between schools disrupts learning for all students in the classroom because more time is required for review and catch-up work.⁴⁰ When affordable housing options are located in high-opportunity areas with low-poverty and economically diverse schools, they can dramatically lift the academic performance of low-income students and narrow the achievement gap between them and their more affluent peers.⁴¹ Across the country, low-income families are priced out of the strongest

schools; housing near high-performing public schools costs 2.4 times more than housing near low performing public schools.⁴²

Racial Equity: Affordable homes located in economically diverse neighborhoods can help reduce residential segregation and concentrations of poverty. Today, one in four Black families and one in six Latino families live in neighborhoods of concentrated poverty, compared to only one in 13 white families. A recent study by the Urban Institute found that if Chicago reduced its residential segregation just to the national median, incomes for African Americans would rise by \$2,982 per person per year, regional GDP would increase by \$8 billion, the homicide rate would decrease by 30%, residential real estate values would increase by \$6 billion, and 83,000 more adults would complete bachelor's degrees.⁴³

Economic Mobility: Affordable homes can also help children climb the income ladder as adults. Economist Raj Chetty and his team looked at low-income children whose families used housing vouchers to access affordable homes located in neighborhoods with lower poverty. These children were much more likely to attend college, less likely to become single parents, and more likely to earn more as adults. In fact, younger children who moved to lower-poverty neighborhoods with a housing voucher earned an average of \$302,000 more over their lifetimes compared to their peers in higher-poverty neighborhoods.⁴⁴ In 2015, the Children's Defense Fund modeled an expansion of the Housing Choice Voucher program and found that expanding these housing subsidies would reduce child poverty by 20.8% and lift 2.3 million children out of poverty.

Criminal Justice: Individuals transitioning out of the criminal justice system face many housing obstacles and are vulnerable to homelessness. They need good places to call home so they can reconnect with society and rebuild their lives. Formerly incarcerated individuals who find stable affordable housing are less likely to go back to jail than those who do not.⁴⁵

Veterans: After serving our country, veterans need access to decent, stable, affordable homes so they can thrive in the neighborhoods they swore to defend. Rental assistance for veterans has proven highly effective in dramatically reducing veteran homelessness, but there remains significant unmet need.⁴⁶

⁴⁶ Fischer, W. 2014. Rental Assistance Helps More than 340,000 Veterans Afford Homes, but Large Unmet Need Remain. Center on Budget and Policy Priorities. Retrieved from: <https://www.cbpp.org/research/rental-assistance-helps-more-than-340000-veterans-afford-homes-but-large-unmet-needs>

The evidence is abundantly clear that being able to afford a decent home in the neighborhood of one's choice is a prerequisite for opportunity in America. The promise of food security, better health, racial equity, increased economic opportunity, and quality education can be fulfilled only if our nation's families have safe, decent, accessible, affordable homes.

Conclusion

Housing and food security are inextricably linked; safe, stable, affordable, and accessible housing is necessary in order to effectively address food insecurity, particularly among households with the lowest incomes. The targeted affordable housing provisions in the "Build Back Better Act" would provide the significant investments needed to preserve and expand our nation's affordable housing infrastructure. NLIHC looks forward to working with Congress to advance the "Build Back Better Act" and achieve the investments and reforms necessary to begin to end housing poverty and homelessness in our country, once and for all.

Thank you for the opportunity to participate in today's roundtable. I look forward to your questions.

My name is William J. Barber III. I am a resident of Durham, North Carolina. I am Founder and CEO of the Rural Beacon Initiative, a small-consultation firm that works to advocate for climate and environmental justice by promoting community-based clean energy projects. I am also the co-chair of the North Carolina Poor People's Campaign ecological justice committee—a group that seeks to educate and elevate the plight of poor communities to the front of our social discourse and policy solutions. I have a B.S. in environmental physics and received my law degree from UNC School of Law in Chapel Hill.

I am tasked today to give an overview of the impacts that energy burden has on poor and low-income communities.

Energy burden is defined as the percentage of gross household income spent on energy costs. According to Department Of Energy's Low-Income Energy Affordability Data (LEAD) Tool the national average energy burden for low-income households is 8.6 percent—three times higher than for non-low-income households which is estimated at 3%. In some areas, depending on location and income, energy burden can be as high as 30%. Of all U.S. households, 44%, or about 50 million, are defined as low-income.

Those living in energy poverty who choose to prioritize warmth are often forced to make difficult decisions about household essentials which can lead to **poor** diets, known as the heat-or-eat dilemma.

In a 2020 publication, entitled High Energy Burden and Low-Income Energy Affordability, Marilyn Brown et al found that—and I quote-- despite decades of weatherization and bill-payment programs, low-income households still spend a higher percent of their income on electricity and gas bills than any other income group. Their energy burden is not declining, and it remains persistently high in particular geographies such as the South, rural America, and minority communities.

In a 2021 publication on Energy Impoverishment and Energy Insecurity in the United States by Dr. Elva Moleka—it was found that, alarmingly, despite energy abundance in the US coupled with the propagation of energy efficiency, bill-payment assistance programs, and weatherization programs, low-income households continue to pay high energy bills while their environmental, social, and economic conditions erode. Equitable energy distribution has long been an issue of concern when studying the prevalence of high energy burdens, and there is far greater eligibility and need to participate in existing bill payment assistance and weatherization programs than there is availability. Rather, many low-income households continue to live in older homes, which are often characterized by structural issues such as poor insulation, inefficient HVAC systems, leaky roofs, and inefficient and sometimes oversized appliances that increase energy costs

Additionally, many low-income households struggle to pay their utility bills due to the unprecedented economic, social, and health challenges of the COVID-19 pandemic that dramatically impacted the ability of households to meet their financial needs.

As a resident of North Carolina, I come from a state where 1.4 million people are sent energy bills every month they can't afford. Structural issues with the houses and apartments accessible to poor people often make it difficult to incorporate solutions such as solar arrays or energy efficiency measures, both of which also have high upfront costs.

Racial disparities exacerbate this energy poverty. Energy-burdened households are more likely to earn less than \$20,000 annually and be of African-American or Latino descent. Compared to white households, Black households spend 43% more of their income on energy costs, Hispanic households spend 20% more; and Native American households spend 45% more.

Legacies of discriminatory policies like redlining have made households of color more likely to live in inefficient housing with old, energy-guzzling appliances and HVAC systems, Earther reported.

According to a recent report by the American Council for and Energy Efficient Economy, 25% of Americans pay more than 6% of their income on energy bills even before COVID-19 hit. Of those people, 13% pay more than 10% of their income on their energy bills. Nationally, 67% of low-income households face a high energy burden. And of those households, 60% have severe energy burdens.

The report found that the energy burden in four southern States: Alabama, Kentucky, Mississippi and Tennessee are the highest in the nation, 38% above any other region, with Alabama being the [worst in the country](#).

This vicious cycle of poverty might best be described as what Dr. Sacoby Wilson, of the University of Maryland School of Public Health, [describes](#) as environmental slavery – when the environment that you are in keeps you locked in poverty and suffering.

There are many factors that might influence high energy burden. Examples include higher-cost fuels, such as propane or other bottled fuels, and energy-inefficient homes. Energy-inefficiency can be due to a lack of insulation in older homes or older appliances. For households that face these challenges, there is a greater opportunity for energy and cost savings. Low-income communities face barriers to accessing energy technologies which help make energy more affordable, such as solar photovoltaic (PV). Solar PV adoption by moderate-income households has increased since 2010, representing 48% of adoptions. Low-income households, however, represented just 15% according to a Lawrence Berkeley National Laboratory (LBNL) report.

There are factors that can prevent low-income households from accessing energy technologies, including a lack of qualifying credit and the inability to finance upgrades. LEAD Tool data estimates that 59% of low-income households are renters—not owners—of their homes. This predominance of renters further compounds the issue into a split incentive: landlords may not be motivated to pay for energy improvements, leaving potential energy bill savings out of reach for the low-income tenants.

There is hope if our leaders act. Funding weatherization and energy efficiency programs such as the installation of smart equipment could have the greatest impact in high energy burdened states. the introduction of energy efficiency programs in each state could lead to \$600 or more cost savings per household per year, or approximately 25% reduction in energy burden. Electric bill savings delivered by Solar for All programs is another solution to the energy burden problem, in that this method could provide LMI families with the benefits of locally generated clean energy through efforts such as the DC Solar for All project (Daniel, 2019).

In addition to energy efficiency, investments in utility bill assistance programs such as the low income home energy assistance program and weatherization assistance program can help save low income families hundreds of dollars per year. (Oak Ridge National Laboratory).

Now, as we stand in this moment of collective impact from the pandemic of COVID-19 and a looming hunger crisis, made worse by accelerated climate disaster and rising poverty, we must seek bold, transformative solutions that uplift communities and work to advance social equity for all.

Testimony of Dr. Jamila Michener

Associate Professor of Government and Public Policy
Co-director, Cornell Center for Health Equity
Cornell University

Prepared for the U.S. House of Representatives Committee on Rules

Examining Family Budgets and Food Insecurity

October 13th, 2021

Chairman McGovern, distinguished members of the Rules Committee, and everyone participating today: thank you for gathering here and holding this hearing to discuss the critical issue of food insecurity. I appreciate the opportunity to draw on my research expertise to highlight the experiences and voices of Americans who are living in or near poverty, shouldering sometimes devastating health cost burdens, and struggling to feed their families.

My name is Jamila Michener. I am a social scientist whose research focuses on poverty, racial inequality, and public policy. I spend much of my time studying and teaching about the ways public policies interact with the larger economy to shape (and often constrain) civic and material well-being of low-income families. Much of my work is focused specifically on health policy. My research speaks to the circumstances of Americans living in or near poverty, who are disproportionately people of color, and who must navigate the U.S. healthcare system in a context of economic instability and insecurity.¹ As co-director of the [Cornell Center for Health Equity](#), not only do I conduct my own research, but I also support other scholars in conducting research on health policy, health systems, and the social determinants of health.

A central takeaway I want to emphasize today is that health is an exceptionally expensive resource in the United States.² It should not be, but it is. Healthcare is contingent on economic status and exceedingly difficult for many people to afford (even those who have health insurance).³ This means that maintaining your health and the health of your family can create budgetary burdens and siphon resources that would otherwise be used

for crucial needs like food and nutrition. As the Rules Committee consider pathways to ending hunger, I urge you to confront the related challenge of providing people with affordable access to high quality health care.

Key Facts: Healthcare, Financial Burdens, and Food Insecurity

The evidence is clear: low-income families are made more financially precarious when they pursue their healthcare needs. Here are a few relevant facts.

- A little over one quarter of U.S. adults (26 percent) say they or a household member have had problems paying medical bills in the past year, and about half of this group (12 percent of all Americans) say medical bills had a major impact on their family.⁴
- In 2020, roughly 18% of U.S. households reported having medical debt.⁵
- Patient out-of-pocket healthcare costs are up 10 percent since last year, with the 2021 total of patient financial responsibility costing approximately \$491 billion.⁶
- In 1980, the average annual patient financial responsibility was \$250 per patient. That figure skyrocketed to \$1,650 by 2021.⁷
- Medical debts are higher in poorer neighborhoods. In the lowest-income ZIP codes, people owe an average of \$677.⁸
- People who report problems paying medical bills in the past year commonly respond by spending less on household necessities. A 2018 survey found that 30

⁷ Heath, Sarah. 2021. “Patient Out-of-Pocket Healthcare Costs Balloon by 10% Since 2020.” Available: <https://patientengagementhit.com/news/patient-out-of-pocket-healthcare-costs-balloon-by-10-since-2020>

⁸ Kluender, Raymond, Neale Mahoney, Francis Wong, and Wesley Yin. “Medical Debt in the US, 2009-2020.” *JAMA* 326, no. 3 (2021): 250-256.

percent of those surveyed struggled to pay for necessities such as food, heat, and housing due to medical costs.⁹

- These struggles are worse for Americans with chronic illnesses. Approximately 1 in 3 chronically ill people report being unable to afford food, medications, or both.¹⁰
- In a study of people with heart disease, more than one-third of people with medical bill problems said they had skipped needed drugs, cut back on groceries, or were in general “financial distress.”¹¹

Food Insecurity and Medical Costs: A Debilitating Cycle

A growing body of evidence links food insecurity to common and preventable chronic conditions, including obesity, hypertension, and type 2 diabetes. Food insecurity makes people sick. Importantly, however, the relationship between food insecurity and chronic disease also goes in the other direction: bad health makes it harder to work, leading to lower income and increased risk of food insecurity.¹²

Working families experience a high and growing burden of health care costs. Estimates indicate that 9 percent of the total costs to raise a child go towards healthcare.¹³ Even when someone is insured, out of pocket health care expenses stack up quickly and include costs for services not often covered by insurance (dental, vision, mental health services etc.), health insurance premiums and copays, prescription drugs, medical supplies, and more.

⁹See: <https://www.norc.org/PDFs/WHI%20Healthcare%20Costs%20Coverage%20and%20Policy/WHI%20Healthcare%20Costs%20Coverage%20and%20Policy%20Issue%20Brief.pdf>

¹³ See: <https://www.usda.gov/media/blog/2017/01/13/cost-raising-child>

On the other side of the ledger, health problems can create barriers to earning income. Income suffers when people must take days off from work for doctors' appointments and hospital stays, stop working altogether to care for ill family members who are not covered under the current health insurance system, receive surprise bills for services that they thought were covered by their health insurance, or reduce their work hours to deal with health issues. Even the cost burden of employer sponsored healthcare has grown from an average of 28 percent in 2010 to 30 percent in 2016, with insurance premiums growing faster than income.¹⁴

All of this points to a devastating cycle by which food insecurity and medical financial spark mutually reinforcing patterns of precarity that leave too many Americans sick and hungry.

A Perspective from the Ground: Beyond the Numbers

For millions of Americans, lower health care costs could mean eliminating the difficult choices between receiving medical treatment or putting food on the table. Some of my research involves systematic qualitative interviews with people facing these kinds of problems. If the statistics and patterns described thus far seem abstract or far away, consider what they mean for a real person, struggling to make it by.

Margie is a woman from Illinois who a 61-years-old at the time I interviewed her. She was unemployed but actively looking for work. She was also a diabetic with high health care

¹⁴ McCarthy-Alfano, Megan, Aaron Glickman, Kristin Wikelius, and Janet Weiner. 2019. "Measuring the Burden of Health Care Costs for Working Families." *Health Affairs*. Available: <https://www.healthaffairs.org/doi/10.1377/hblog20190327999531>

costs. Unfortunately, she was too young to qualify for Medicare and not enrolled in Medicaid (though she was likely eligible for the latter). Margie needed both food and medicine to live, but she sometimes found herself in the impossible position of having to prioritize one over the other. She explained it this way:

Go to the grocery store, then you can't go to the doctor, because I have to go to the doctor every three months, I have to have pills every damn day. So that is very expensive, you know...sometimes you have got to choose between medicine and food. That's rough.

To navigate the complex dance of balancing a slim budget to meet both her health and nutrition needs, Margie utilized every resource she could. For example, she relied heavily on community health clinics in her neighborhood:

I get a discount when I go to the board of health clinic...that's all I got to depend on is those clinics because I pay 15 dollars to see the doctor, every three months...I go there to see the doctor, he prescribes the same medicines...I got like three or four medicines I take a day... but hell they're talking about closing [the clinic] down now...I'm afraid that when they do, if this goes any further, then I'm going to be broke. And I can't still afford to pay my insurance or my medical bills.

Margie's experiences are exemplary of a larger pattern: many Americans have limited budgets that are stretched unbearably thin by mounting medical costs. They rely on a patchwork of federal, state, and local policies and programs to survive. When those policies lack sufficient resources, economically vulnerable Americans are unable to make ends meet and face choices between core necessities like food and medicine.

Policy Paths Forward

This is not the way it has to be. Though some people may have become accustomed to stories like Margie's, most Americans do not believe that anyone should have to make these tradeoffs. 63% of Americans believe that the government has a responsibility to ensure everyone has healthcare.¹⁵ Government should play a fundamental role in securing

¹⁵ Jones, Bradley. 2020. "Increasing Share of Americans Favor a Single Government Program to Provide Health Care Coverage." PEW Research Center: <https://www.pewresearch.org/fact->

widespread protection from the debilitating financial consequences of the U.S. healthcare system. Some existing programs are safeguards from the economic disaster that exacerbates food insecurity.

Medicaid, our nation’s largest health insurance program, provides health coverage to low-income families. Medicaid serves more than 80 million Americans.¹⁶ Medicaid protects people from debt, bankruptcy, eviction, and other financial catastrophes by providing them with much needed access to healthcare.¹⁷ Supporting and strengthening Medicaid can help the very families most likely to face food insecurity. This means expanding Medicaid in states that have not done so and strengthening the program everywhere.

Changes made during the pandemic have taught us more about what works to keep as many people insured through Medicaid as possible. Policies that allow for continuous eligibility (removing the constant risk of being disenrolled), easy and accessible application and

renewal processes, and reduced administrative burdens are all an important part of making sure everyone who needs Medicaid can get it.¹⁸

Another key goal should be to improve coordination between public benefits programs focused on health—like Medicaid—and those focused on nutrition, like WIC and SNAP. Research shows that both WIC and Medicaid participation are associated with less food insecurity and fewer cost-related medical challenges.¹⁹ Still, programs like these often operate in silos despite serving largely overlapping populations. Coordination, communication, and learning between programs can help to make existing policies more effective, while providing essential resources in the most humane way possible.²⁰ Improvement in the administration and coordination of public programs can ensure that the people administering Medicaid, WIC, SNAP, and other policies understand the resources available to program participants, are trained to identify problems like food insecurity, and can direct program participants towards resources and solutions.

Even beyond major public programs like Medicaid, there are numerous important options for alleviating the challenges that emerge at the nexus of food insecurity and medical scarcity. The range of possibilities include robust and continual funding for local health institutions²¹, especially those in low-income communities and communities of color;

regulations that limit the incidence of “surprise” billing²²; and programs that provide relief from medical debt.

Conclusion

These policy options only scratch the surface. The imperative is clear: food and medicine are both fundamental human rights. In a country with the resources and wherewithal of the United States, we can provide both vital resources to every denizen, especially those that are most vulnerable.

**Committee on Rules
U.S. House of Representatives
Roundtable Series on Ending Hunger in America**

**Written Testimony of
Mr. Robbie Mäkinen
President & Chief Executive Officer
Kansas City Area Transportation Authority**

October 13, 2021

I met a woman on the bus the other day. Through casual conversation she learned that I was the CEO of KCATA (branded as RideKC regionally). She could not thank me enough for making regional transit “free” to customers. She told me the money she used to spend on fares now enables her to pay for groceries and medicine. My new acquaintance shared with me some of her day-to-day struggles to make ends meet. Like her, 58% of RideKC customers are African American, and like her, 72% of RideKC customers do not have a car available to them.

During the pandemic of 2020, public transit emerged as a lifeline, ensuring essential workers kept the country breathing. Despite the great loss and turmoil endured in 2020, public transportation remains that one thing that connects people to the opportunities that improve lives, change lives, even save lives. And it hasn’t gone unnoticed. There has been a shift in public perception as transit has clearly demonstrated its vital role as an “essential service.”

RideKC fulfills its mission to connect people to opportunities by focusing on the Four Pillars of Access: **Access to Jobs, Education, Healthcare and Housing, built on a foundation of Social Equity**. Kansas City’s Zero Fare transit initiative is one way that RideKC is improving access to opportunities for people who need it most by eliminating the barrier and burden of fare payment. Zero Fare immediately puts that \$1.50 cash fare to work in household budgets and in the local economy.

RideKC is the first transit agency in a major U.S. metropolitan area to implement Zero Fare transit in the last two decades. We navigated toward Zero Fare over several years, first offering all veterans free rides (2017), then high school students, then safety net providers. As KCATA launched its third bus rapid transit route (Prospect MAX) with Zero Fare, support from the community and elected officials grew.

Zero Fare has been in place systemwide since March 2020. For those living paycheck to paycheck, even the \$50 income they would have spent on a monthly bus pass will improve the quality of life in the Kansas City area. It has increased ridership, sped up boarding time and improved operator safety by eliminating the source of 90% of driver-involved disturbances. In fact, between 2019 and 2020, on-board safety incidents reduced 39%.

Because of Zero Fare, ridership has recovered at a faster pace in KC than nationally. In April 2020, while most of the country's transit ridership was just 20% of 2019 levels, RideKC's ridership held at 58% of 2019 levels. By October 2020, national ridership was still just 40% of 2019 levels, while RideKC had rebounded to 80% of 2019 levels.

Two local studies have shown positive community benefits of a Zero Fare program. A 2019 study by the Center for Economic Information in the University of Missouri - Kansas City's (UMKC) Department of Economics states that the regional financial impact of Zero Fare will be between \$13 and \$17.9 million¹. The UMKC study also reports how people will maximize the financial resources they realize by not paying a fare. According to the study, it will be spent in four key areas: housing (55%), health care (18%), retail-groceries and other purchases (15%), and insurance (11%).

The Mid-America Regional Council's (MARC) econometric forecast model estimates the annual economic impact of continuing suspended fares is likely to raise regional economic output by \$4.2 to \$13.8 million and personal income by \$1.3 to \$4.6 million.² MARC's analysis indicates that Zero Fare is likely to increase ridership between 20% and 60%.

The City of Kansas City, Mo., has committed \$4.8 million per year to fund Zero Fare. In our first private sector Zero Fare partnership, Blue Cross Blue Shield of Kansas City (Blue KC) has agreed to fund up to \$1 million toward the success of this initiative. Blue KC values a healthy community and through its mission wants to help Kansas Citians access opportunities for employment, education and quality food, which is vital to the overall health of our neighbors, family and friends.

At RideKC we are not just talking the talk. We are walking the walk with programs like Zero Fare. We are taking the blinders off and looking beyond the numbers to see real people, like the hard-working woman I met on the bus. Our Zero Fare initiative is pumping money back into the community and the local economy. By weaving ourselves into the fabric of the community, RideKC is positioned to be a part of the solutions for the community.

Committee on Rules

Ending Hunger in America: Family Budgets and Food Insecurity

As a Mississippian and a civil rights lawyer, I want to thank you for affording me this opportunity to discuss the connection between America's criminal justice system and the sad reality that millions of people in our extremely wealthy country face serious food access challenges. Poverty is palpable in Mississippi, and I live much of my life at the treacherous intersection of poverty and our current criminal enforcement regime.

At the MacArthur Justice Center, we have for years used litigation as a vehicle for challenging systems that pummel the poor and create substantial barriers to economic stability for millions of people annually. We see firsthand the devastating impact of excessive misdemeanor fines and fees and the judicially-sanctioned shakedown of people threatened with incarceration, driver's license suspension, wage garnishment, credit score damage, loss of voting rights, tax refund intercepts, and loss of professional licenses if they don't pay up. These people are forced to make very difficult financial choices, and many ultimately choose to go without food. Add to this the ways in which our criminal justice system denies adequate representation to people who can't afford an attorney, locks up those who don't have money for bail, revokes probation when supervision fees and monitoring costs go unpaid, and provides no meaningful reentry programs for the hundreds of thousand of people released from prison each year, and the role our courts play in punishing poverty and contributing to large-scale human suffering becomes painfully clear.

Fines and Fees

More than \$50 billion dollars in criminal debt is owed by approximately 10 million people in the United States due to their involvement in the criminal justice system.¹ In Mississippi alone, people involved in the criminal justice system owe more than \$507 million.² It is estimated that approximately 13 million misdemeanor charges are brought annually in the United States, not including the more than 40 million speeding tickets issued every year.³ In nearly 600 municipalities, fines account for over 10% of general revenues. In 80 of those jurisdictions, fines generate over half of budget revenue.⁴

¹ <https://www.policylink.org/our-work/just-society/fines-fees>

² https://mississippitoday.org/2021/01/13/mississippians-saddled-with-507-million-in-criminal-justice-debts-preventing-future-opportunity/#disqus_thread

³ <https://www.prisonpolicy.org/reports/pie2020.html>

⁴ <https://www.forbes.com/sites/nicksibilla/2019/08/29/nearly-600-towns-get-10-of-their-budgets-or-more-from-court-fines/?sh=bcae7364c998>

For those appearing in misdemeanor and traffic courts across America, “justice” is swift and harsh. With very rare exceptions, defendants do not have lawyers. Dozens or hundreds of cases are handled each court session, and the amount of time spent on a case often can be measured in seconds rather than minutes. Fines are meted out without regard for income and ability to pay - one size fits all - and state assessments (referred to as “fees”) are automatic “add-ons” that often are larger than the fines imposed to punish the offense.⁵ (See, for example, the Starkville, Mississippi fees and assessments schedule attached hereto). In a matter of minutes, a misdemeanor defendant can easily owe more than \$1,000 in fines and fees. Payment terms vary from jurisdiction to jurisdiction, but it is regularly the case that defendants are given 90 days or less to pay. In some jurisdictions, the time allowed for payment is even shorter.⁶

Scraping together the money needed to avoid the serious consequences threatened by the court is difficult for many. The Federal Reserve’s Report on the Economic Well-Being of U.S. Households finds that 40% of Americans would not be able to pull together \$400 in cash without borrowing money or selling possessions, highlighting the impact fines and fees can have on financial security.⁷

In Alabama, thousands are trying to balance the costs of fines with other expenses and needs. A survey by the Alabama Appleseed Center for Law and Justice⁸ found that for those with outstanding court debts:

- More than 80% cut back on basic needs like rent, food, medical bills, car payments, and child support just to pay down their debt
- Almost 40% committed a crime to pay off their debt
- 44% used payday or title loans to pay off their debt
- Almost 50% shared that they thought they would never be able to pay off their debt

In addition to the possibility of being jailed illegally or enduring numerous other sanctions for failure to pay, defendants in 34 states can have their licenses suspended for nonpayment.⁹ Due to limited access to public transportation and the reality that the vast majority of Americans must drive in order to go to the grocery store, work, take their children to school, seek health care, and attend church, many of those with suspended

⁵ Mississippi’s State Auditor publishes a comprehensive summary of assessments added to misdemeanor tickets in the Hospitality State.

<https://www.osa.ms.gov/techasst/AssessmentGuide.pdf>

⁶ Settlement agreements in debtors’ prison cases handled by our office provide for \$25/month payment plans and community service options. Absent litigation, such payment terms are exceedingly rare.

⁷ <https://www.federalreserve.gov/publications/2019-economic-well-being-of-us-households-in-2018-dealing-with-unexpected-expenses.htm>

⁸ <https://www.alabamaappleseed.org/underpressure/>

⁹ <https://finesandfeesjusticecenter.org/campaigns/national-drivers-license-suspension-campaign-free-to-drive/>

licenses are subjected to numerous citations for driving without a license (and often also for lack of insurance). These additional fines and fees quickly run into the thousands of dollars. This harsh and unfair reality creates obstacles to full participation in the local economy and highlights the need for passage of the Driving for Opportunity Act.¹⁰

Reentry

At any one time, nearly 6.9 million people are on probation, in jail, in prison, or on parole in the United States. Those in prison endure years of eating small portions of food devoid of nutrition.¹¹ Each year, more than 600,000 individuals are released from state and federal prisons.¹² 91 percent of returning citizens report being food insecure.¹³

While our “social contract” may commit us to welcoming those who have paid their debt to society back into our communities and providing avenues for successful reentry, the truth is that very few states have implemented the kind of robust support systems necessary to give released persons the assistance they need in order to obtain employment, housing, transportation, health care, and economic security. More than 96% of incarcerated people will eventually return to our towns and neighborhoods, and many will find themselves homeless, sick, and back in prison unless we invest in effective reentry programs.

Indigent Legal Defense System

Any serious conversation about criminal justice and poverty must address the troubling disparity between the substantial resources available to prosecutors and police and our meager investment in indigent legal defense. If we are serious about living into the promise of *Gideon*, it is imperative that the federal government act now to provide grants to state and local governments for funding indigent defense. Early intervention by competent defense counsel in felony and misdemeanor cases makes a tremendous difference in outcomes. “Equality of Arms” is a cornerstone principle of our commitment to fair trials, but a close examination of our public defender system reveals inequalities that make it impossible for many indigent defendants to obtain justice – solely because of their poverty.

¹³ <https://www.bread.org/sites/default/files/downloads/briefing-paper-mass-incarceration-february-2018.pdf>

Policy Suggestions

I respectfully submit that the following actions would address some of the problems outlined in my testimony:

- Condition federal grants on confirmation that the state doesn't restrict voting, suspend driver's or other professional licenses, jail people, or extend probation terms due to unpaid debt;
- Condition municipal funding on the use of a sliding scale fines structure reducing current fines for indigent defendants rather than simply raising fines for affluent defendants¹⁴;
- Adopt more realistic measures of "indigence" or "inability to pay" than current Federal Poverty Guidelines;
- Provide grants to municipal governments and encourage alternative means of revenue generation in order to decrease their dependence on collections of fines and fees;
- Rebalance social policy-oriented funding programs and criminal-legal funding programs, including Byrne-JAG, and redesign all performance metrics so they prioritize noncarceral, social policy-oriented interventions;
- Incentivize state and local governments to seek funding for other areas currently authorized under Byrne-JAG, such as indigent defense, courts, drug treatment, and mental health programs;
- Instruct DOJ to collect data and conduct studies regarding these issues, including the extent to which current policies and practices disproportionately impact people of color;
- Pass the Driving for Opportunity Act;
- For those released from prison, provide a 90-day SNAP "grace period" that recognizes the challenges of reentry and does not count against other SNAP eligibility (much like we give students six months to "get their legs under them" after graduation from college before demanding payment of federal student loans); and
- Pass legislation similar to the Ensuring Quality Access to Legal Defense (EQUAL) Act proposed by Vice President Harris and Congressman Deutch in 2019

Again, thank you for this opportunity to discuss these matters that are of utmost importance to people in my home state and across the country. I welcome any questions you may have.

 Municipal Judge

Effective JANUARY 07, 2019

Domestic Violence Sec 99-3-7; No Bail shall be granted until the person arrested has appeared before a Judge at the first reasonable opportunity, not to exceed 24 hours from the time of arrest. The appearance may be conducted by telephone. If a bond is not set within 24 hours, the defendant should be released ROR and given a court date.

In America's hunger crisis, charities and neighbors are lifelines

The pandemic made it tougher for lower-income people who already were struggling to get enough good food. Across the nation, groups are stepping up to help.

QUEENS, N.Y.

María Quinteros, 84, wearing an American flag face mask, waits with hundreds of others at Latinos Unidos, a group that hands out free food boxes each Friday. Food insecurity may have affected about 45 million Americans in 2020, according to Feeding America, the country's largest hunger-relief organization. PHOTOGRAPH BY NATALIE KEYSAR

BY CASSANDRA SPRATLING

PUBLISHED JULY 13, 2021
• 30 MIN READ

It's early for most people. 5:30 a.m. But not for Bessie Brooks, who's heading out her door to help get food to people who need it in Lowndes County, Alabama.

To hear her tell it, though, that's not early at all. "When I was working, I'd be at my patient's house by 5 a.m.," Mrs. Brooks says.

Journalistic standards suggest I call her by her last name, Brooks. My manners suggest otherwise. I respect her by adding Mrs., as I was raised to do by my mother, who spent part of her growing-up years in Lowndes County. Mrs. Brooks is 87, after all. She worked 30 years as a home health worker for the county. The job required her to give personal care: Get them up, bathed, brush their teeth, give them their meds. But Bessie Brooks went beyond that and did whatever needed doing.

"I don't see no sense in a person getting up and bathed, and they hungry," she says.

So she'd cook for her patients and clean house. If they didn't have running water, she'd fetch some from a neighboring home. Running water wasn't a given in every house in Lowndes County, which [Feeding America](#), the nation's leading organization of food banks, identified as the 16th most food insecure county in the United States in 2020. Almost a third—29.5 percent—of the people in Lowndes County do not have sufficient food.

MAYSEL, W. VA.

Autumn (at left) and Sydney King unpack food sent home with them from Clay Elementary School as their mother, Jennifer, reviews their homework. Jennifer attended the school and had the same speech therapist as her daughters. The therapist, Kathi Linkinogger, often drops off food for the Kings, and Jennifer considers her “practically like family.” The Kings do not have a car and rely on others for rides to a grocery store. With a two-million-dollar federal grant, the school district is developing innovative ways to encourage self-resilience and confidence, to equip students to handle life’s challenges. It has designed a curriculum that teaches skills such as cooking basic meals, growing vegetables, and household budgeting.

PHOTOGRAPH BY MADDIE MCGARVEY

Record numbers of Americans needed more food in 2020, reversing what had been a downward trend. One in seven people in the U.S. may have been food insecure, meaning a lack of access to sufficient, nutritious food. The numbers are only slightly better this year, according to projections released in March. Feeding America expects 42 million people—one in eight Americans—to experience food insecurity in 2021. That includes 13 million children, or one in six, who may be short of food this year. The sorrowful images of rows of cars lined up for food across the U.S. during the pandemic illuminated a long-standing problem, one that the [coronavirus](#) didn’t create but made worse, says Claire Babineaux-Fontenot, Feeding America’s chief executive officer.

“I think there’s a heightened awareness that hunger was here to begin with,” she says. “For so long, people in America didn’t think that America has a hunger problem.”

Babineaux-Fontenot hopes renewed attention to food insecurity puts to rest the fallacy that those who line up for food giveaways are either lazy or unwilling to work. “It’s never been true,” she says. “So many people who turn to us for help are working-class people who have jobs. Some of them have more than one. They’re working really, really hard. They work as hard as anyone else works, if not harder than most people do. And they still can’t make ends meet.”

CLAY COUNTY, W. VA.

Alex McBee (at left), Jen Lively, and Chris Lively hold their dogs outside their home in Clay County. They live miles from the nearest grocery store and have been receiving deliveries of food from Amanda Shelton, a teacher at Clay County High School, since the beginning of the pandemic. “If it wasn’t for them,” Chris says, “we’d probably starve.”

PHOTOGRAPH BY MADDIE MCGARVEY

Food insecurity is especially high in rural America, according to reports from Feeding America and the Food Research and Action Center, a nonprofit dedicated to ending poverty-related hunger and undernutrition. Some 16.5 percent of rural households with children faced food insecurity in 2018, compared with 13.5 percent of households in metropolitan areas, according to a FRAC report. The differences are attributed to higher rates of poverty related to fewer and lower-

paying jobs, longer distances to travel to get to large grocery stores with reasonably priced and plentiful foods, lack of transportation, cost of gas, weather, and often greater challenges accessing federal nutrition programs.

“Less employment, lower income, transportation issues, lack of access to healthy, affordable food without having to go a long distance, that pushes more people into food insecurity,” says Geri Henchy, FRAC’s director of nutrition policy and early childhood programs.

CLAY COUNTY, W. VA.

Chris searches for roots on a hillside near his home. He met his wife, Jen, when they were in junior high in Ohio. They’ve lived in West Virginia since 2016; selling roots that they find is their only source of income. The roots, when dried, are sold for use in homeopathic medicines.

The paradox is that rural residents often live in areas where the very food they need is growing. “So if you’re in a land of plenty, why would you, if you’re driving past fields of food, why would you have food insecurity?” Henchy asks. “It seems counterintuitive,” she says, “but the thing is that because of the ways that the supply chain works for food, the people who live in areas that produce food, generally speaking, are not having access to that food.”

Lowndes County, AL: Aiding those in need

It’s in a stretch of Alabama once known as the black belt because of the rich soil that delivered an abundance of cotton and other crops, tended by enslaved labor. Now Lowndes County is part of a region people think of as the black belt because of the number of Black people who live there.

Snow Hill Christian Church is one of the main places people here turn to for help to put food on the table when cupboards run low. It was that way long before COVID-19 coursed through America’s veins, shuttering businesses, closing schools, and landing people in food lines.

“There were already a lot of people who didn’t know where their next meal was coming from, so the pandemic didn’t do us any favors,” says the Reverend Dale Braxton, Sr., pastor of the place known as “the little friendly church on the hill.”

DUNLOW, W. VA.

Willard Marcum, a veteran firefighter, drives the 725th and final vehicle through the Dunlow Community Center food pantry in Dunlow, West Virginia, nearly 12 hours after the first volunteers arrived that morning. Laid off from his coal mining job in 2019, Marcum now works up to 90 hours a week to support his wife and seven grandchildren. He picks up food for them and for elderly neighbors who don’t have cars. Bill Likens, who opened the food pantry in 2003, has seen the local need increase since several pantries in neighboring towns closed, leading many people to travel to

Dunlow and even spend the night in line in their cars. The number of families served by the food pantry grew from 300 in 2019 to 900 in November 2020, its busiest month because of pandemic-related job losses and heightened food insecurity around the holidays. Volunteers provide each family with about 130 pounds of food and other necessities.

Mrs. Brooks retired in 1998, but she didn't retire from helping others. She is one of the key people Braxton counts on to help distribute food to those who need it. While she used to go it alone—organizing and packaging food for people in need—she now depends on one of her five children to drive her to the church, where volunteers pack her car with food, and her daughter drives her to homes of those she knows need food.

“She’s short in stature but a giant when it comes to giving,” says Braxton, who leads the food distribution efforts in the county of 9,726 people, more than a quarter of them (26.6 percent) living in poverty, according to the U.S. Census Bureau. A May 2020 report said Lowndes had the state’s highest unemployment rate and its highest COVID-19 infection rate. As of this May, the county led the state in COVID-19 vaccinations; more than half of eligible people had received at least one dose.

Braxton, who has managed food distribution through the [Montgomery Area Food Bank](#) for at least 30 years, didn’t think twice when he was asked to distribute weekly food boxes delivered from June through December, a part of the U.S. Agriculture Department’s Farmers to Families program. “It is our mission to feed the hungry, clothe the naked,” Braxton says. “I don’t want anybody to be hungry. I’ve always had a passion to seeing that people, especially children, are well fed as well as well educated.”

Neither is easy in Lowndes County, where people have to drive up to 30 miles to a city such as Selma or Montgomery to shop at a major grocery store.

“We’re a very poor county,” Braxton says.

Hunger rises again

U.S. food insecurity declined consistently in the decade after the Great Recession of 2007-09. By 2019, it had reached its lowest point in more than a decade. But then the pandemic upset this progress.

People in the U.S. living in food-insecure households

The jump in Americans who didn't have access to enough food in 2020 reversed what had been a downward trend.

For Ritha Luckie, 61, a single parent who cares for two adult children with special needs, the food boxes have been a great help. In March 2020, the pandemic closed the adult day-care center her sons attended five days a week while she worked as a lab assistant in a health clinic. A van used to pick her sons up before she went to

work. Once the center closed, she had to pay someone to come to her home before she could go to work.

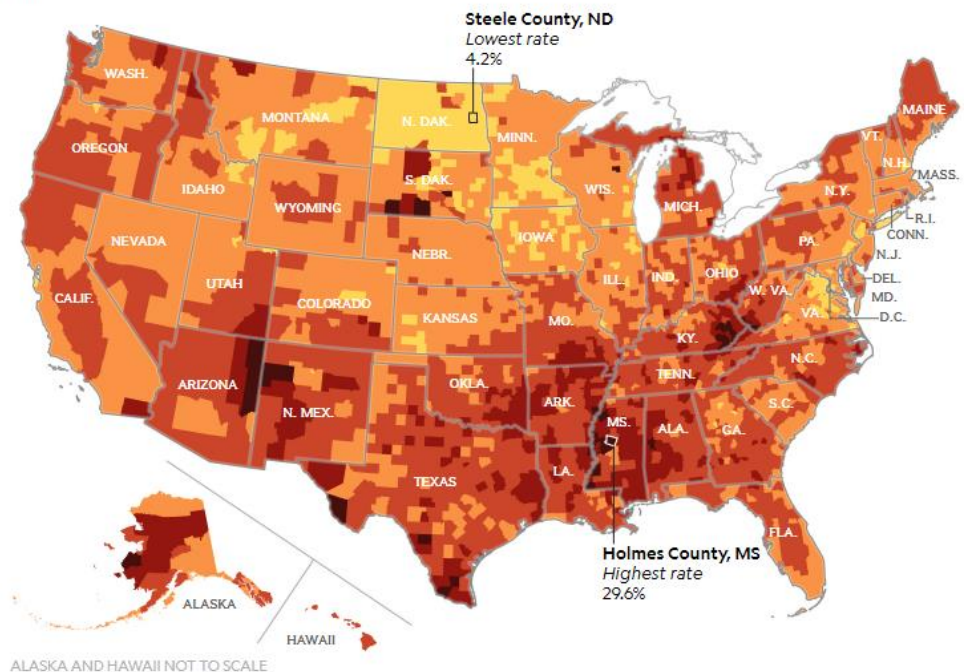

That’s when she started getting the food boxes. Both sons receive disability payments, but those aren’t enough to keep two grown men fed. “It’s been a blessing for me, and I know it’s been a blessing for a whole lot of people around here,” Luckie says. Usually the boxes contain milk, juice, and fresh fruits and vegetables, including a big bag of white potatoes. “I can do a lot with a bag of potatoes,” she says. “I can make hash browns, mashed potatoes, and boiled potatoes. I know how to make it stretch.”

Across the U.S., free grocery stores and community refrigerators are filling a void. Doctors and nurse practitioners are writing prescriptions for healthy food, and prominent chefs are prioritizing serving the community over profit. Volunteers and entrepreneurs are feeding the hungry.

Where hunger spiked in the U.S.

When COVID-19 hit, many in the United States already on the verge of food insecurity were plunged into even deeper crisis. According to the hunger-relief organization Feeding America, an estimated 45 million people may have lacked sufficient access to food in 2020. The pandemic—erasing years of gains in the battle against hunger—appears to have caused food insecurity to rise in nearly every U.S. county.

Food-insecurity rate projected for 2020*

Change in food-insecurity rate, 2019 to 2020*

*THE FOOD-INSECURITY RATE FOR 2020 IS PROJECTED BASED ON AN ANNUAL UNEMPLOYMENT RATE OF 9.2 PERCENT AND A POVERTY RATE OF 11.1 PERCENT.

Unequal access

Communities of color were at a disproportionately higher risk of food insecurity well before COVID-19, and the pandemic has exacerbated long-standing inequities linked to factors including discrimination and systemic racism.

Drivers of insecurity

Unemployment and poverty have a substantial effect on the risk of household hunger. At the start of the pandemic, four in 10 people visiting food banks were there for the first time. Food insecurity is expected to decline in 2021.

Los Angeles, CA: Help for immigrants

Juan Martínez, 50, who came to the U.S. from Mexico in 1998, worked two full-time jobs to help support his wife, Elizabeth, and their three sons, ages 17, 15, and eight. He’d work 10 a.m. to 4 p.m., five days a week, at one restaurant. Then he’d go directly to the other, working 4:30 p.m. to 11:30 p.m., six days a week. Most weekdays it was well past midnight before he’d get home. At the restaurants he’d do whatever needed to be done: wash dishes, take food to tables, do janitorial work.

When the pandemic hit and closed both restaurants, he went from working up to 70 hours a week to none. The pandemic has been especially devastating to undocumented workers such as Martínez because although they pay taxes, they were ineligible for stimulus checks, food stamps, and unemployment compensation. Martínez doesn’t know how he’d have fed his family without [No Us Without You LA](#). The initiative was launched in March 2020, when the nation’s economy came to a screeching halt, closing restaurants nationwide and leaving millions without work.

Responding to the pandemic

The amount of food distributed last year by Feeding America could provide every U.S. resident with three meals a day for more than six days. Its food banks served 44 percent more meals in 2020 than in 2019.

Meals distributed by Feeding America

Source: Feeding America

It's not just about handing out food boxes: Attacking food insecurity also means reducing waste and promoting nutritious foods.

“No Us Without You LA was born out of frustration and anger,” co-founder Othón Nolasco says. When the pandemic hit, he and his business partner, Damián Diaz, watched as people reached out to help chefs, waitstaff, and other visible faces of the restaurant industry. They saw nothing being done for dishwashers, cleaning crews, and others often described as the backbone of the restaurant business. Many of those workers in Los Angeles are undocumented, they say, and therefore not eligible for federal aid.

QUEENS, N.Y.

On Tuesday mornings, CENTI Queens, a church and community organization, passes out free groceries to those in need. Volunteers create an assembly line for food distribution as the trucks arrive. Many people who pick up groceries say they lost jobs because of COVID-19 and are struggling to feed their families. People start lining up at about 9 a.m., and the food is distributed around noon.

PHOTOGRAPH BY NATALIE KEYSSAR

Nolasco and Diaz know the importance of the less visible workers because they started their careers as dishwashers themselves, learning the business from the back to the front of the house, and eventually starting a restaurant- and bar-consulting business, Va’La Hospitality.

“Both Damián and I began our illustrious careers as dishwashers,” Nolasco says. “We ran food, bused tables, and expedited orders as young college-age kids. This is where our deep respect for back-of-house staff comes from.”

The National Geographic Society, committed to illuminating and protecting the wonder of our world, funded Natalie Keyssar's storytelling about faith in the American South in 2020-21.

ILLUSTRATION BY JOE MCKENDRY

After 14- to 16-hour days running a bar, the only time they got to sit down for a decent meal was at the end of the day after closing, when the crew prepared a plate for them to share a “family meal.”

“Very simple dishes often made with the lesser cuts or scraps of what’s left over from the day’s prep, the meals were definitely made with lots of love,” Nolasco says.

Initially the pair used their own money to feed 10 families they know. They soon were buying more food and feeding more families, aided by donations as word spread of their efforts. Now No Us Without You LA is a nonprofit organization that feeds over 1,600 families a week.

Each family gets a 100-pound box of food weekly. Generally it contains a gallon of milk, 30 eggs, six pounds of beans, six pounds of rice, a variety of fruits and vegetables, and tortillas made from organic, non-genetically modified corn from a local company called Kernel of Truth Organics.

“It’s a huge, huge help. It feeds me and my family,” says Martínez. “I can’t imagine what life would be like without this program.”

QUEENS, N.Y.

A community refrigerator in Queens allows people to drop off or pick up donated food.

PHOTOGRAPH BY NATALIE KEYSSAR

Not everyone celebrates No Us Without You LA. Nolasco says the nonprofit group occasionally gets hate emails or calls from people opposed to undocumented workers getting assistance. Such backlash pains the group and those it helps. Merced Sánchez, a 59-year-old licensed street vendor who came to the U.S. from Mexico in 2001, calls the volunteers “professional servants for the community.” She and her husband, José, both worked two jobs before the pandemic.

“We work hard. The majority pay taxes and don’t commit crimes. Still, we are all labeled as criminals and dirty people. We are not bad people,” Sánchez says.

Houston, TX: ‘Meals with dignity’

When the pandemic shut down restaurants in Texas, chef Chris Williams pivoted from serving customers at his popular Houston restaurant to serving the community in a city that led the state in COVID-19 infections and deaths.

Initially he and the team at Lucille’s, well known for its southern cuisine spiced with international flavor, served frontline workers, focusing on sometimes overlooked night shift workers. Lucille’s served 3,000 meals in the first 20 days of the pandemic. Then Williams thought of another group he feared was being

overlooked: senior citizens living in nursing homes in impoverished, mostly Black communities.

HOUSTON, TEX.

Kimberline Rivas (at right) and Lawrence Walker, members of the Lucille’s 1913 kitchen staff, prepare meals to be distributed for free across Houston. Lucille’s 1913 is a nonprofit run by Chris Williams, owner of the popular restaurant Lucille’s. Williams targets “forgotten people” in retirement facilities and other places. Lucille’s 1913 now serves up to 800 meals a day for those in need. Neighborhoods receiving meals include one where Williams’s extended family resides.

PHOTOGRAPH BY GRAHAM DICKIE

“They’ve been uniquely affected; cut off from their families. Their families can’t come check on them,” Williams says. And he suspected the meals they were receiving weren’t prepared with the care and consideration he knew he could provide. His goal, he says, was to offer “nutritious, delicious meals that they will be excited about. You know, meals with dignity.”

With assistance from World Central Kitchen—chef José Andrés’s NGO dedicated to providing meals in the wake of natural disasters—Williams’s efforts grew into a nonprofit he named [Lucille’s 1913](#). It honors Williams’s great-grandmother Lucille B. Smith, a pioneering entrepreneur in Fort Worth. In 1913 she started a catering company that served the likes of Martin Luther King, Jr., and boxing champion Joe Louis. She used some profits from her business to push for better living conditions for African Americans in Texas.

Williams says Smith's spirit guides him. "The roots of her business are the exact same for this," he says. "She saw a definitive need in our community ... and she knew that she was uniquely positioned to make a difference in the community through the medium of food."

HOUSTON, TEX.

Chris Williams, chef and owner of Lucille's, stands next to a photograph of his great-grandmother, Lucille B. Smith, for whom the restaurant is named.

PHOTOGRAPH BY GRAHAM DICKIE

Lucille's 1913 now serves daily meals to up to 800 seniors, plus 150 students and 28 teachers and administrators at a school adjoining the nonprofit's kitchen. But the mission of Lucille's 1913 extends far beyond giving out meals.

Williams says he grew up with plenty but had friends who had very little on their kitchen tables. He sees lots of check-cashing stores and fast-food restaurants, but few markets with a variety of fresh produce.

So he's tackling the issue of food security from the ground up. Besides preparing meals, Lucille's 1913 will take stewardship of 74 acres in two Houston-area counties, Harris and Fort Bend. The land will be used for growing fresh produce and providing employment opportunities through the culinary arts. Williams also

plans to open two markets in those areas to sell produce and locally made products. People hired from those neighborhoods will learn farming or entrepreneurial skills while helping to feed people in their communities.

Right: The Detroit Community Fridge on the city's east side was founded by two Wayne State University students in August 2020 and gives people access to free fresh and frozen foods and other necessary supplies such as diapers, feminine products, and clothes. Additional fridges are planned across Detroit this year.

PHOTOGRAPHS BY SYLVIA JARRUS

Detroit, MI: Feed people, reduce waste

From the back lot of Jefferson Avenue Presbyterian Church you see both Indian Village, an upscale community of stately mansions directly behind the historic structure, and—one block over—a poorer community of vacant lots and modest homes that have seen better days. People line up for food, but not just boxes of canned goods and produce as is typical at many food giveaways. They get free meals, enough to feed a family of four to six, prepared in the church kitchen that is called the [Upcycling Kitchen](#) because the chefs turn food that otherwise would be garbage into gourmet cuisine.

The meals are an initiative of the nonprofit [Make Food Not Waste](#), an organization dedicated to improving the climate and the city's food security by reducing food waste. By showing people what can be done with the rescued food it receives, the group began an effort that it believes can save people money and help save the planet.

MINNEAPOLIS, MINN.

Cooks Rosa Sanchez (at left) and Dolores Hidalgo at Chowgirls Catering in Minneapolis prepare sandwiches to be distributed to people in need as part of the Minnesota Central Kitchen program.

PHOTOGRAPH BY DAVID GUTTENFELDER

Attacking food insecurity means more than giving away boxes; it requires systemic changes, says chef Phil Jones, a force behind Make Food Not Waste. “There’s so much more good that can be done for people and the planet,” says Jones, who also started a company called [Farmacy Food](#). It offers freshly prepared, appealing, and nutritious dishes at low cost. Its goal is to show people, especially those living in low-income neighborhoods, that you can get fast food that’s good for your budget and your belly.

The National Geographic Society, committed to illuminating and protecting the wonder of our world, has funded Explorer...[Read More](#)

ILLUSTRATION BY JOE MCKENDRY

Make Food Not Waste gets surplus food from grocers, vendors, and other local businesses. Meals are prepared weekly for about a thousand area residents. The group also hopes to teach them more about improving health one forkful at a time. “We’re encouraging people to try new flavors and eat more fruits and vegetables,” says Danielle Todd, founder and executive director of Make Food Not Waste. “You can get cheap food, something just to fill the body up, but it doesn’t fuel the body with the right things.”

Left: Michelle Vue carries bags of food, delivered by volunteers from the nonprofit organization Involve MN, back to the forest encampment where she, her partner, and others live in St. Paul. Vue moved to Minnesota from Mississippi in February 2020 and stayed with a friend in Minneapolis until he was evicted from his home in July. Vue and others in the camp are ethnic Hmong and have endured racist abuse from people who fear they’ll spread COVID-19.

Right: Kaitlin Knutson of Involve MN, left, hands a Thanksgiving meal to Christy Haanen, who lives in this tented encampment in a park in St. Paul. Before the pandemic, the police would force people to leave every few days and even destroy their shelters. “Not all of us choose to be out here,” Haanen says. “But many don’t have a family. They don’t have anybody. Except the family they made out here.”

PHOTOGRAPHS BY DAVID GUTTENFELDER

The Upcycling Kitchen aligns with her upbringing in New Orleans, Louisiana, chef Ederique Goudia says. “We were raised to treat everyone like family. This is a way I can use my skills, and do it in a way that’s dignified. Driving up for a meal is like picking up catering from your favorite chef or restaurant.”

The arrangement also challenges the chefs to be creative, because they never know what ingredients they’ll have to make culinary magic. “It’s fun to see what I get, then think about what can I create,” Goudia says. “The other day I got a huge amount of broccoli and created broccoli pesto over spaghetti, so people got to see broccoli prepared in a way that if you tasted it, you wouldn’t even know it was broccoli.”

A volunteer with Involve MN distributes Thanksgiving meals at a homeless encampment in St. Paul. The group was started in 2019 by Grant Snyder, a Minneapolis police officer, and his wife, Melanie, to serve the homeless and vulnerable. Minnesota, which boasts 16 Fortune 500 companies, has dozens of homeless encampments scattered throughout the Twin Cities area. The pandemic added more than 100,000 food-insecure people in the state in 2020. The Minnesota Central Kitchen, an initiative of the Second Harvest Heartland hunger-relief network, provides free meals at more than 50 sites in the Twin

Cities metro region. Through partnerships with MCK, furloughed chefs are paid to make meals for the hungry. The organization has served 1.5 million meals since March 2020. Eleven kitchens and catering companies participate in the program, which has saved 200 jobs and rescued 1.6 million pounds of surplus food.

PHOTOGRAPH BY DAVID GUTTENFELDER

Marvin Dixon, 52, a single father with two teenagers, says the food has been a blessing. He lives off Social Security because of an injury, but gets enough aid only for himself since he doesn’t have legal custody of his children, though they live with him. “The food from the church helps tremendously,” he says. “I don’t have to buy extra food with the little money I do have. And, you know, these teenagers, they can eat.”

If Congress Changes Food Stamp Requirements, Kids Will Go Hungry

By Sarah Bowen, Sinikka Elliott and Annie Hardison-Moody

Ms. Bowen, Ms. Elliott and Ms. Hardison-Moody are professors who have conducted a study on child hunger.

- July 1, 2018

Credit...Wenting Li

“What do you do when you’re hungry?” we asked Maylee, a 6-year-old girl. “I go to bed and think about eating,” she said.

We first met Maylee’s family in 2012, when we began a five-year study about food and poverty in North Carolina. Over the course of the project, we conducted multiple interviews with more than 100 poor and working-class mothers of young children, including Maylee’s mother, Ashley Taylor. We also made ethnographic observations of 12 families: accompanying them on trips to grocery stores and food pantries, tagging along during school lunches and doctor’s visits, and spending time in their homes as they cooked and ate. And in 2017, we interviewed the kids in each family.

Four months before we interviewed Maylee, her family’s food stamps had been cut off because of an administrative error. Ashley still hadn’t been able to get it straightened out. “It’s been tough,” said Ashley. She regularly went to food pantries, and Maylee and her younger sister received backpacks filled with food from their school. Ashley was always looking for sales and recipes that she could make on a budget, and she had cut back on the size of her own meals. But even with all her efforts, there just wasn’t enough. “The kids don’t eat the way that I’d like,” Ashley said.

In 2016, [children in 3.1 million households](#) experienced food insecurity at some point during the year. Whether temporary or chronic, food insecurity is [devastating for kids](#). As a nation, we have

historically tried to align our policies with the belief that we should do what we can to prevent children from being hungry. When he signed the National School Lunch Act in 1946, President Truman [said](#), “In the long view, no nation is any healthier than its children.” Almost 20 years later, President Johnson argued that the food stamp program [represented](#) a way of “apply[ing] the power of America’s new abundance to the task of building a better life for every American.”

Our national policies have long reflected, imperfectly, the moral imperative that children deserve adequate food. Until now.

The draft of the [farm bill](#) that was [passed by the House](#) on June 21 entails an important change in the rules governing the Supplemental Nutrition Assistance Program (SNAP, also known as food stamps). SNAP is the country’s most important food assistance program, serving [one out of every eight](#) Americans.

While SNAP already has work requirements for [able-bodied adults without children](#), the House’s proposal imposes an [even harsher policy](#) and extends it to parents of school-age children. It would require that most adults provide monthly proof that they are working or enrolled in at least 20 hours of work force training per week in order to receive support. Those who can’t comply — whether it’s because they can’t find a job or their work hours drop below 20 hours a week — could be locked out of the program for three years.

The Senate’s bipartisan version of the bill, [passed](#) last Thursday, does not include those changes to SNAP. As the House and Senate now try to reconcile their differences, a major question is whether the stricter work requirements that will leave more kids hungry will become law.

Tightening SNAP’s eligibility rules is one of the Republicans’ central goals. President Trump offered [his support](#), as did the [White House](#), for stricter work requirements in the farm bill, and the House Agriculture Committee chairman, Michael Conaway, [predicted](#) that the new work requirements would make it into the final version of the bill.

[Analysts estimate](#) that the new rules would impose large administrative costs on states and lead to more than one million people losing their food stamps. On average, each of those people would lose [\\$1,816 in SNAP benefits](#) annually. And because a majority of the people at risk are in households with children, the result would be more hungry kids.

The United States has held on to a tenuous agreement over recent decades that children deserve to have enough to eat, no matter what their parents do. The House proposal puts us in jeopardy of losing even this modicum of decency. Although the new rule technically targets adults, children will suffer as a result of it.

Eleven-year-old Avery, one of the kids in our study, knew that her dad sometimes skipped meals because he wanted “to make sure us kids get full.” Avery also said that when she got hungry, she went outside and ran around, or drank “bottles and bottles of water,” until the feeling went away.

Some kids talked about going to neighbors’ houses and asking for something to eat. Eight-year-old Clayton proudly explained that he collected cans and bottles to help pay for food for his family.

“If you could tell the president something about food, what would it be?” we asked dozens of the kids we interviewed. More than one child wanted to tell the president about their favorite food. Eight-year-old Phoebe’s answer has stayed with us: “That I don’t have enough.”

Millions of children in the United States are like Phoebe. The new SNAP rules proposed by the House would drastically cut many families' SNAP benefits, making an already harsh reality even worse for kids in food-insecure households. SNAP should not be restricted; to the contrary, it should be expanded, so that fewer families — and especially kids — are hungry.

Sarah Bowen is associate professor of sociology at North Carolina State University. Sinikka Elliott is assistant professor of sociology at the University of British Columbia. Annie Hardison-Moody is assistant professor of agricultural and human sciences at North Carolina State University.

A Heartbreaking Choice for Moms: Food or a Family's Future

We've studied mothers struggling to feed their kids. Trump's new rule will scare immigrant families into going without.

Aug. 21, 2019

Attorney General Xavier Becerra of California announcing that the state is challenging the Trump administration's new "public charge" rule that will make it difficult for immigrants who receive public assistance to obtain green cards. Credit...Justin Sullivan/Getty Images

By Sarah Bowen, Sinikka Elliott and Annie Hardison-Moody

Dr. Bowen, Dr. Elliott and Dr. Hardison-Moody are professors.

Between 2012 and 2017, as part of a study of how low-income mothers feed their children, we talked with women who had moved from Mexico and Central America to the United States. They came here because they wanted to be able to offer their children more than they'd had growing up, including a full belly at the end of every day. Over the course of our research — amid increasing ICE raids, tightened work restrictions and growing anti-immigrant sentiment stoked by President Trump's rhetoric — we found that many families became afraid to apply for food assistance programs. The Trump administration's [new "public charge" rule](#) will intensify this kind of fear for immigrant families, including those who are in this country legally. One result will be more hungry families and children.

By allowing the government to deny permanent legal status (also known as green cards) to people who have received public benefits like housing assistance, SNAP or Medicaid, the new rule — which will go into effect Oct. 15 if it survives legal challenges, including suits by [California](#), [New York](#) and [Washington](#) — will force families to choose between putting food on the table and the promise of future citizenship.

One of the most commonly used and vital public benefits is SNAP, also known as food stamps. With traditional “welfare” programs nearly decimated in many states, SNAP is one of the only resources that many people have to feed their families. Although SNAP benefits are [not available to undocumented](#) noncitizens, noncitizens in some categories are eligible for SNAP, and citizens — for example, American-born children in immigrant families — can receive SNAP even when other members of their family are undocumented.

But in a climate of heightened anti-immigrant sentiment, immigrant families have been increasingly opting out of SNAP, even before the new public-charge rule was announced. A recent study of [almost 40,000 caregivers of young children](#) found that SNAP participation decreased markedly among immigrant families in 2018, especially for families who had been in the United States for less than five years. And in our research with low-income Latina immigrant mothers and their families in North Carolina, we witnessed how their fears grew over time and prevented them from seeking the public supports to which they were entitled.

Take the case of Claudia, a woman who had immigrated from Mexico 14 years before we first interviewed her. During the time we knew her, Claudia had legal but temporary residency. Her five children, all born in the United States, were American citizens and eligible for SNAP, while Claudia’s partner, a day laborer, was undocumented.

During the winters, when Claudia’s partner couldn’t find enough work, her family frequently experienced food shortages. “There have been times when we were in bad shape and we’d run out of food,” Claudia recalled. “But what could I do? We didn’t have anything else.” Her problems were exacerbated by complications with their SNAP benefits, which she was nervous about renewing, because she was afraid to admit to “the government” that she needed help, worrying that doing so could somehow put her status at risk or lead to her partner’s deportation.

At the time of the study, the uncertainty and confusion Claudia and women like her experienced were understandable, especially given wide variation in eligibility for noncitizens across programs like Medicaid, SNAP and WIC. They worried that any misstep or misunderstanding could threaten their immigration status. Under the new rule, their worries will be based on something even more concrete. By refusing legal status to those who can’t afford food or health care and seek help, the rule will further drive immigrant families into the shadows, forcing them to sacrifice their health and security to maintain even a chance of receiving permanent legal status down the road.

And by discouraging immigrants, including those who are legally entitled to benefits, from seeking them, the harsher public-charge rule is at odds with a fundamental truth of the United States: that it is built on immigrant labor and would not exist were it not for the sacrifices and suffering of the people who have landed on its shores tired, poor and hungry.

U.S. HOUSE OF REPRESENTATIVES
COMMITTEE ON RULES
EST. 1789 | JAMES P. McGOVERN (MA-2), CHAIRMAN

U.S. HOUSE OF REPRESENTATIVES
Committee on Rules

**ROUNDTABLE: “Ending Hunger in America: Examining the Reality
of Benefit Cliffs”**

October 27, 2021

Testimony to the Rules Committee, United States House of Representatives October 21, 2021

Stephanie Hoopes, Ph.D., National Director, United for ALICE

Good morning. I'm Stephanie Hoopes, National Director of United For ALICE, a driver of innovation, research, and action around individuals and families experiencing financial hardship. Thank you for inviting me to this House Rules Committee roundtable on food insecurity. I'd like to introduce you to someone very important to this conversation — someone you all know, but maybe not by name. At the center of the dual health and economic crises of the COVID19 pandemic is ALICE: households that are **A**sset **L**imited, **I**ncome **C**onstrained, **E**mployed, with little or no savings, struggle paycheck to paycheck to afford essentials in the communities where they live, but often make too much to qualify for public assistance. As such, is at the center of the dual health and economic crises of the COVID19 pandemic.

When ALICE doesn't make enough food is often the first to be cut from the family budget, thus, food insecurity is the canary in the coal mine for policy makers, indicating bigger problems beyond food. We have all seen food insecurity increase during the COVID-19 pandemic for those who did not have enough resources to meet basic needs. Food insecurity does not exist in isolation; job losses, reductions in wages, housing instability, health issues, and social isolation all contribute. As an indicator of the impact, the increase in food bank and food pantry usage during the Great Recession mirrored an increase in the number of ALICE households. We don't know the full impact of the pandemic yet.

Who is ALICE?

We all know ALICE. You have probably already interacted with several ALICE workers today: the server at your coffee shop, your child's child care worker, the security guard in the parking lot. During the pandemic, ALICE was the essential worker who enabled many of us to work from home. ALICE is your neighbor, your grown child, your parents. Many of us have ourselves been ALICE. The ALICE data dispels many myths and stereotypes about who is struggling financially. ALICE households come in all ages, race/ethnicities, genders, and household combinations. They live in cities, suburbs, and rural areas. In fact, they live in every county in the U.S.

Two years before the pandemic, 51 million households in the U.S. struggled to get by (Figure 1). Technically, ALICE households earn above the FPL but below the ALICE Threshold (our measure based on the bare-minimum ALICE Household Survival Budget). In 2018:

- 16 million households (13%) earned below the FPL
- 35 million households (29%) — more than twice as many — were ALICE
- Combined, 42% of households in the U.S. were below the ALICE Threshold

Figure 1. Households by Income, United States, 2018

Sources: ALICE Threshold, 2018; American Community Survey, 2018

ALICE topline demographics

The ALICE data dispels many myths and stereotypes about who is struggling financially. For more details, visit our website, UnitedForALICE.org

- **Race/ethnicity:** The largest group in absolute terms are White households (29 million). Because some groups faced additional barriers to higher income, they also disproportionately faced financial hardship. Notably, 60% of Black households, 57% of American Indian/Alaska Native, and 56% of Hispanic households were below the ALICE Threshold, compared to 36% of White and Asian households.
- **Household type:** The largest group in absolute terms are single or cohabiting households with no seniors or children under the age of 18 (23 million). Families with children account for almost one-third of households below the ALICE Threshold. In percentage terms, single-female-headed families were more than three times as likely to be below the ALICE Threshold as married-parent families. Seniors are also disproportionately ALICE.

Why did we create the ALICE metrics?

Like you, we were trying to understand what was happening and how many families were struggling in our community and our economy. In 2008, I was on the grants committee of United Way of Morris County, excited to have a pool of resources that we could target on this relatively affluent county's small population in poverty (4-5% at the time). But the grant applications revealed much greater financial hardship, and we couldn't make sense of the mismatch. As a professor at Rutgers at the time, I undertook an investigation into why the official, traditional economic measures weren't painting an accurate picture of what was happening in our community.

The main problem was the Federal Poverty Level (FPL). The FPL is based on the same set of assumptions used when it was created 60 years ago to measure the impact of Lyndon Johnson's war on poverty. Interestingly for this committee, at the core of the FPL is food: The FPL is based on the assumption that food should account for one-third of your household budget, and its calculations are made on that basis. But food now accounts for closer to 10% of the budget; the levels were never adjusted, only increased by the rate of inflation, leaving the FPL at an impossibly low threshold for economic survival.

The criticisms of the FPL are well known — it fails to account for some of the biggest household expenses such as housing and child care, it has not adapted to a changing economy (such as the change in the cost of food), and it does not account for geographic variation within or between states (except Alaska and Hawai'i). The FPL is the same in Indianapolis as it is in New York City, even though the cost of living in Indianapolis is 30% less.

So we calculated what it actually cost to live and work in Morris County, NJ — the bare minimum for housing, child care, food, transportation, health care, and taxes — and found it was several times higher than the FPL. This is a no-frills budget that we call the ALICE Household Survival Budget; the full breakdowns of the Budget by county and household type are available on our website, [UnitedForALICE.org](https://www.unitedforalice.org). For insight, this Budget uses the USDA Thrifty Food Plan for the cost of food (which is also used for SNAP). How much is that? About \$260 for a single adult – for a month (in 2019). Not \$260 for a week (or one nice dinner out for your family). That's \$260 to last for 30 days (ALICE Report for Michigan, 2019). And this bare-bones budget does NOT include savings, a vacation, or even a child's birthday present. This is not a sustainable budget — just the minimum needed to get by.

We then calculated how many households in Morris County earned below the Survival Budget — and we found that instead of 5% of families struggling, the actual number was 25%. One-quarter of families in the county couldn't make ends meet.

We named these households ALICE, shared the budgets and demographics in a report — and I thought my work was done. But then people started recognizing ALICE, and using the ALICE measures, and wanting to change policy to help ALICE families. A year later, I heard from a county official that she'd just left a meeting where in the middle of a policy debate, a colleague asked how the new policy initiatives would impact ALICE. At that point, I knew we had created something valuable.

Fast forward 12 years, 300 research advisory committee members, and hundreds of state and local partners later, and we have ALICE data for every state and every county in the country. We have 24 partner states, dozens of reports, and a robust interactive website. Our non-partisan research is non-partisan and our rigorous methodology is transparent and regularly reviewed by external experts. The ALICE measures and data have grown in response to demand from users, and they have become part of the national dialogue on financial hardship.

Why are there so many ALICE households?

The key is the match — or mismatch — between wages and the basic cost of living. The core of the problem is a simple fact: The cost of household basics is higher than the wages of many of the most common occupations. The Household Survival Budget reports the cost of the essentials (housing, child care, food, transportation, health care, and a smartphone plan, plus taxes) needed to live and work in the modern economy. In 2018, the national average annual budget for a family with two adults and two children in child care was \$67,476 — three times the FPL for that family (\$25,100) and more than the median wages of each of the four most common occupations nationwide. For example, a family with both parents working full-time — one in retail sales, earning the median hourly wage of \$11.63 (or an annual salary of \$23,260), and the other in food preparation, earning \$10.22 per hour (or an annual salary of \$20,440) — cannot afford this budget. A family with the next two most common occupations — office clerk (\$15.74 per hour) and cashier (\$10.78 per hour) — also falls short (Figure 2).

Figure 2. Family Household Survival Budget vs. Income and FPL, United States, 2018

Sources: ALICE Household Survival Budget, 2018; Bureau of Labor Statistics - Occupational Employment Statistics, 2018

How are the costs of basics changing compared to the overall rate of inflation?

The ALICE Essentials Index is an ALICE tool that tracks the increase in cost of the household necessities included in the Household Survival Budget (dark blue line in Figure 3). The costs of these items are increasing 3–4% annually, almost twice as fast as the overall rate of inflation (1.8%) (light blue line) tracked by the Consumer Price Index (CPI), which looks at all goods and services that people in metropolitan areas buy. Both indices show that for many ALICE workers, costs are increasing faster than wages. In Figure 3, the average wage of a retail sales worker

(blue dotted line) is not keeping pace with either the increasing costs of essentials in the ALICE Essentials Index or with overall rate of inflation shown in the CPI.

The impact is even starker for those who also depend on public assistance. Families with children reliant on the Supplemental Nutrition Program for Women with Infants and Children (WIC), or those with a disability who rely on Supplemental Security Income (SSI), are seeing the value of their benefits erode over time as costs rise.

Figure 3. ALICE Essentials Index vs. CPI, United States, 2007–2018

Sources: ALICE Essentials Index, 2007–2018; Bureau of Labor Statistics—Consumer Price Index, 2007–2018. For more information, visit www.UnitedForALICE.org/Essentials-Index.

Does ALICE benefit from public assistance?

Despite their increasing struggles, most ALICE families do not meet the technical definition of being in poverty and therefore are not eligible for most public assistance programs.

With the focus of this roundtable being food insecurity, let's examine who is eligible for the primary food assistance programs — those earning at or near the FPL:

- Supplemental Nutrition Assistance Program (SNAP): 130% of FPL (\$33,475 for a family of four in 2019)
- Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) 185% of FPL (\$47,368 for a family of four in 2019)
- School meal programs: 130% of FPL for free meals and between 130% and 185% of FPL for reduced-price meals (between \$33,475 and \$47,368 in 2019).

Yet the cost of basics is almost double these eligibility limits in most places. For example, in Michigan, the Household Survival budget totaled \$64,116 in 2019 for a family with two adults and two children in 2019. Which means that the thousands of families earning between \$33,000 and \$64,000 were struggling, but were not eligible for SNAP benefits. As a result, food banks and food pantries that do not ask for income information are often inundated with ALICE families trying to get by.

How did the COVID-19 pandemic impact ALICE families?

Our new report, [The Pandemic Divide: An ALICE Analysis of National COVID Surveys](#), provides the first look at the impact of the pandemic on ALICE households. The report reveals that experiences and realities diverged during the pandemic: ALICE families struggled financially, physically, and emotionally, while households with higher incomes were more likely to report 'living comfortably.'

The report reveals that food insecurity in particular was a major concern for ALICE during the pandemic. Despite emergency SNAP, unemployment insurance, and stimulus payments, ALICE households struggled to afford food. According to one survey, 39% of respondents below the ALICE Threshold said they had difficulty meeting food needs, compared to only 8% of those above the Threshold.

Families with children especially struggled with access to and affordability of food throughout the pandemic. Among respondents below the ALICE Threshold with children:

- Four in ten (41%) reported that “sometimes” or “often” their children were not eating enough because the household couldn’t afford enough food. While this was less common in higher-income households, a substantial 17% of respondents above the ALICE Threshold also struggled to afford food for their children (U.S. Census Bureau’s Household Pulse Survey, January 20–February 1, 2021).
- More than half (56%) reported that they were concerned about having enough food for the household compared to 15% of respondents above the Threshold with children (United For ALICE COVID-19 Impact Surveys).
- Nearly half (49%) of both Black and Hispanic respondents reported difficulty affording food for their children during the pandemic, compared to 35% of White respondents (Household Pulse Survey, January 20–February 1, 2021).

“This pandemic has completely impacted my family. One [household member] completely lost a job, no unemployment [insurance], and can't find another job. Another [household member] is working less hours and cannot afford anything. I go hungry so my kids can eat. Food stamps got taken away because of what I make...”

*- United For ALICE Survey respondent,
Shenandoah Valley, Virginia*

- 21% reported facing food insecurity due to lack of meals provided at school, compared to 7% above the Threshold (University of Southern California’s Understanding America Study’s Understanding Coronavirus in America survey).

Will increasing ALICE workers’ wages lead to families falling off the “benefits cliff”?

Increasing the take-home pay of the lowest-paid workers has enormous benefits for the health of all family members and for child development, as well as societal benefits in terms of lower levels of crime and higher rates of civic participation. Research also indicates that there is little or no effect on employment, hours, or benefits. See our [ALICE Wage Tool](#) fact sheet for more information.

Since the eligibility level for public assistance is far below the ALICE Household Survival Budget, most ALICE families do not receive benefits. The benefits cliff¹ is a serious issue for households in a small income band, close to the FPL.

To identify specific scenarios of the impact of wage growth on eligibility for benefits over time, the Federal Reserve Bank of Atlanta, in partnership with United For ALICE and United Ways, are offering a new Career Ladder Identifier and Financial Forecaster ([CLIFF Dashboard](#)). The CLIFF tool:

- Shows graphically the gap between eligibility for public assistance and the ALICE Household Survival Budget.
- Helps career coaches advise job seekers about which jobs can earn enough to support the Household Survival Budget and lead to financial stability.
- Helps policy makers understand how tax revenue is impacted by wage growth.

In the long term, ALICE families would benefit from more accessible benefits and those that support a career ladder where steps include work and training and allow for life changes. In the short term, families that receiving public assistance would benefit from coordination between the agencies that provide benefits (for example, HUD and USDA) and a gradual phase-out of those benefits as their earnings increase allowing for a smoother transition.

How do families move from poverty to financial stability?

Because there is no one type of ALICE family, there is no one solution. And because there are so many households that are in poverty or are ALICE, moving 51 million households to financial stability is a huge undertaking.

Our new report, *The Pandemic Divide*, provides some insights into the characteristics of those whose financial situation improves over time. While most respondents below the ALICE Threshold reported in November 2020 that their current financial standing was worse off or at least stayed the same compared to 12 months earlier, 19% reported being much better off or somewhat better off (Federal Reserve Board’s Survey of Household Economics and

¹ The benefits cliff is a term used to describe the point at which a worker becomes ineligible for public or private assistance due to an increase in wages. In some cases, the higher wage is less than the value of the assistance; these workers experience a sharp drop in their net income (the cliff).

Decisionmaking (SHED), November 2020). Characteristics of this group provide some insight into what helps families to be more financially stable:

- Respondents below the ALICE Threshold who reported being somewhat or much better off were more likely to have worked full time, received a raise or promotion, started a new job, had insurance through an employer or union, maintained a savings or checking account, kept rainy day funds, had a retirement plan on track, and been very confident in approval for credit.
- Those below the ALICE Threshold who reported being somewhat or much worse off were more likely to have worked part time, been laid off or lost a job, had household income that varied quite often from month to month, rented rather than owned a home, had to pay an unexpected medical bill out of pocket, owed outstanding credit card debt, set aside no rainy day funds, had medical debt, and was not confident in approval for credit.

The results presented in *The Pandemic Divide* reveal that those who were struggling the most received public assistance, namely TANF, SNAP, Supplemental Security Income (SSI), free or reduced-price lunch, stimulus payments, unemployment insurance, Medicare/Medicaid, or free groceries or meals — an indicator that public assistance was reaching those most in need. The survey results also confirm that even as households received public assistance, they continued to struggle during the pandemic. More research needs to be done to understand the full impact of different assistance policies and vehicles over time. And more work needs to be done to create public assistance programs that can do more than serve as a stopgap measure during a crisis; ultimately, ALICE families need a path to long-term financial stability.

Conclusion

We urge you to take head of the canary in the coal mine and persevere in your work to end food insecurity — and to address all the underlying causes. Security in food — and in housing, child care, transportation, and health care — will make a world of difference for ALICE families. It will also have a positive impact on our wider communities, and on the overall economy. If there's something we have learned from the pandemic it's that we can't live without ALICE, we need ALICE. The strength of the U.S. economy is inextricably tied to the financial stability of its residents. When more people participate in the economy, there is more consumer spending, greater tax revenue, and reduced demand for public services. The more people participate in the U.S. economy, the more it will grow.

With this testimony, I hope that you are persuaded of the value of the ALICE measures in assessing hardship county by county and across the U.S. And I encourage you to consider the essential ALICE workers in your life when making new policy — just as the official did in Morris County, NJ all those years ago.

There's much more in our reports and on our website. And the United For ALICE team would be happy to provide a briefing on our new pandemic report or a tour of our website for your staff or colleagues.

Thank you for inviting me to provide this testimony today.

Dig Deeper with United For ALICE Tools and Resources:

- **Meet ALICE in your community** with our [on our website](#), with topline ALICE data on every U.S. county and more detailed data for our 24 United For ALICE partner states
- **Read about the impact of the pandemic on ALICE households** in our new report, [The Pandemic Divide: An ALICE Analysis of National COVID Surveys](#)
- **Learn about change over time in the cost of household essentials** through a United For ALICE signature measure, the [ALICE Essentials Index](#)
- **See COVID-19 cases mapped with ALICE data** using our [ALICE & COVID-19 Tracker](#)
- **Explore how wage levels impact ALICE households** and what wages different occupations pay by location using the [ALICE Wage Tool](#)
- **Learn more about the difficult decisions that households face when they can't afford the basics** in our Report, [The Consequences of Insufficient Household Income](#).
- **Gain deeper understanding of the United For ALICE methodology** in our [Methodology Overview](#)
- **Try the Federal Reserve's Career Ladder Identifier and Financial Forecaster (CLIFF) Dashboard**. It is designed to help financial, career, and education coaches identify where benefits cliffs can occur, so that they can help their clients anticipate and navigate those barriers to achieve their career and financial goals.

About United For ALICE

United For ALICE is a driver of innovation, research and action to improve life for ALICE (Asset Limited, Income Constrained, Employed) households and all across the country. Through the development of the ALICE measurements, a comprehensive, unbiased picture of financial hardship has emerged across the U.S. Harnessing this data and research on the mismatch between low-paying jobs and the cost of survival, ALICE partners convene, advocate and collaborate on solutions that promote financial stability at local, state and national levels. This grassroots ALICE movement, led by United Way of Northern New Jersey, has spread to 24 states and includes United Ways, corporations, nonprofits and foundations in Arkansas, Connecticut, Delaware, Florida, Hawai'i, Idaho, Illinois, Indiana, Iowa, Louisiana, Maryland, Michigan, Mississippi, New Jersey, New York, Ohio, Oregon, Pennsylvania, Tennessee, Texas, Virginia, Washington, West Virginia and Wisconsin; we are United For ALICE. For more information, visit: UnitedForALICE.org.

United States House of Representatives Committee on Rules Ending Hunger in America: A Conversation about Benefit Cliffs

Written Testimony of Karen Schoellkopf, Founder, CEO of Leap Fund
October 27, 2021

Chair McGovern, Ranking Member Cole, and Members of the Committee,

Thank you for inviting us to participate in this important conversation about benefits cliffs. I'm Karen Schoellkopf, the Founder and CEO of Leap Fund, where we've been singularly focused on benefits cliffs and their effects.

BENEFITS CLIFFS AND THEIR IMPACTS

Benefits cliffs (also called "the cliff effect") occur when someone earns more income at a job, but because of that increase in income, is no longer eligible for public benefits that were worth much more. The problem affects working Americans across the country who earn more money at a job just to make less money overall.

I started working on the benefits cliff issue in 2018, and investigating it with a human-centered, user-centered approach. This means we went directly to public benefits recipients, and the community based organizations (CBOs) providing services to ask, "Is this something you've ever heard of or experienced?" The answer was a resounding yes.

One of the biggest things to keep in mind is that no one knows if they'll hit a benefits cliff until after it's already happened to them.

We learned that there are 2 sets of people affected by benefits cliffs:

1. Those who will actually hit a benefits cliff, and will face a financial catastrophe
2. A much wider group of folks making financially conservative decisions out of FEAR of hitting a benefits cliff

What that means is that people are turning down raises and promotions, cutting hours, and leaving jobs, out of this fear.

It actually has a term named "parking at the cliff", and means that people get stuck not just in utilizing benefits, but trapped in poverty altogether. Working Americans are unable to move ahead in their careers, their education, and their ambitions, because the math doesn't make sense.

Public benefits policies are designed for people to survive in an emergency, but not to actually thrive. What I've heard in talking to working Americans who receive public benefits, is that there's not a single person who doesn't want to work. But with varied and vague benefits policies that don't even address benefits cliffs, it becomes a punishing game of musical chairs, where people scramble to secure financial security as they try to achieve their American dream.

The benefits cliff creates a disincentive to work, but **it's in policy, not in people**. People receiving public benefits are simply working within the parameters defined by policy and making strategic decisions, based on the limited information available.

With new and expanded benefits programs proposals in the Build Back Better Act, extensions of pandemic supports, and increase in the value of the benefits, the time is ripe for governmental review from a federal level, to holistically address benefits cliffs.

LEAP FUND AND OUR APPROACH

At [Leap Fund](#), we're tackling the benefits cliff issue in three ways: our goal is to find, bridge, and eliminate benefits cliffs altogether.

Find the Cliff: Transparency for benefits cliffs

To find the cliff, we took on the issue of transparency: we built a calculator that predicts benefits cliffs, informed by feedback from people receiving public benefits and coaches. Not knowing if you'll hit a benefits cliff is essentially a black box algorithm that runs against people. We're running a Benefits Cliff Coaching Program now, with partners across the country, that trains coaches to talk with clients about benefits cliffs and their potential affects. The overall goal is to bring more information to clients so that they can make the important decisions in their lives, like a client who was able to negotiate their salary by better understanding their particular benefits cliff.

A few quotes from 4 different coaches who have participated in our Benefits Cliff Coaching Program and used our calculator to discuss benefits cliffs with their clients:

*We leveraged Leap Fund's calculator to help participants make **smart, data-driven financial decisions** based on their unique circumstances (request an increase in hours, take or turn down a promotion, etc).*

-

*We're really **thankful for a tool to have concrete conversations** with clients around what benefits look like, and if things change, what that may look like.*

-

*This has been a **good tool for 'what ifs'**. Most of the feedback has been around adjusting certain types of income. Like, 'What if I gain custody of my son?' With the calculator I can predict and [adjust for that].*

-

*With all 32 of our participants headed into full-time seasonal work, the calculator became a **fantastic tool to help them figure out** what benefits would look like going into their new jobs.*

Bridge the Cliff: Avoid the benefits cliff altogether

We also know that transparency is not enough. That's why we're focused on bridging the cliff. If someone finds out that they will hit a substantial benefits cliff, it can be strategic for them to turn

down a raise, a promotion, or more hours to avoid sending their family into a financial catastrophe. We've designed an employer-based financial solution pilot to help people bridge the cliff.

Benefits cliffs aren't just a public benefits issue, they are truly a workforce problem, particularly for employers paying at or around minimum wage in their state. Holistically, no one knows how many workers are susceptible to these benefits cliffs. While it varies by industry, it's likely that around [1 in 5 employers](#) have workers facing benefits cliffs. The financial conservative decisions that workers are making in fear of hitting benefits cliffs impacts an employer's ability to attract and retain talent, maintain predictable scheduling, and can contribute to churn. Industries affected include restaurants and hospitality, retail, healthcare and more.

While this is a newer issue to tackle from the federal government perspective, it's also novel for employers to consider. When we started talking with employers in 2019, many had never heard of the problem, let alone considered the impact it might be having on their workforce. But in the past year through the pandemic, some employers have been quickly upskilled in the mechanics of how this works, in negotiating with their workers on the types of decisions that they're weighing.

There is still more work to do in bridging the gap between employers' and workers' understanding of this issue, from awareness to action. Employers can be a real partner in this work, and are interested to do so, but the learning curve has been steep. Transparency about benefits cliffs must include giving employers and workers the tools to talk about the issue together.

Eliminate the Cliff: Policy change is required

To eliminate the cliff, we're focused on data and storytelling to support policy change. This is one of the reasons we're so excited to be invited to share our work and experience, as governmental partnership is crucial to this issue.

One of our initiatives includes creating benefitscliff.com, which is an educational site solely focused on the benefits cliff issue. When we started in 2018, there was no way to understand who was already working in this space and what they were finding, nor a centralized understanding of who was thinking about policy change and in what ways. We created this website to "open-source" what has already been done around benefits cliffs, so that no one has to start learning about the issue without context, and we can all build quicker and smarter.

There's a real opportunity for the federal government to step into ownership of this issue in a more holistic and rules based way. Not only in understanding the studies and changing policies, but also in more tactical ways, such as making benefits cliff calculators a norm in every benefits agency across the country. There's a lot of work to be done, and shared information is the key to unlocking it.

RECOMMENDATIONS

1: Collect data at scale to fully scope the benefits cliff problem

Knowledge gaps for legislators and agencies

When we started in 2018, we also reached out to folks shaping and enforcing the policies so that we could better understand the issue. We talked with benefits agencies, legislators, as well as think tanks, and asked them if they had heard about the benefits cliff.

The answers we got back were starkly different from public benefits recipients and CBOs. Some had never heard of the issue, some had heard of the issues, but asked me “Haven’t we already solved this?”, and some agreed that it was an important issue but a lower priority amongst many other needs. This illustrates the gap in understanding and urgency between those creating and enforcing the policies, and the public benefits recipients themselves.

Knowledge gaps for employers and workers

This gap of understanding also exists between what workers are experiencing on the ground, and employers’ impression about what their workers need and want. Frequently, workers don’t share about their public benefits with their boss or manager, because there can be stigma around receiving them, and they can sometimes view it as their own private situation. Similarly employers can be hesitant, as some have put it, “to be involved in their employees personal lives.”

Some employers we talked to said they had workers who did in fact turn down raises or promotions. I said, “Oh that’s interesting, did you ask them why?”, and they said, “Huh, no I did not.” There’s this unlit hallway between bosses and workers, which is dark mostly out of fear, misunderstanding, and stigma.

Data Collection Needs

The gaps in understanding stem from a lack of data and understanding. No one knows how many people actually hit benefits cliffs. This is for a variety of reasons, including that government agencies and information is silo’d, data is not shared between agencies let alone with people receiving public benefits, and more often than not, the necessary data to truly understand the scope of the problem is not tracked or collected at scale in the first place. This means benefits cliff data can be hard to come by, or distinctly local, based on who has independently run a study. It’s critical to understand how many people are turning down jobs and promotions and why, and the federal government is uniquely positioned to collect this data at scale, to better understand the scope of the benefits cliff problem nationally.

2: Streamline the benefits experience and make it digital

User-centered Functionality

We expect other tools to be online, accessible, and understandable (from student loan interfaces, to music streaming services, to tax filing, to social sharing apps). Public benefits must rise to the occasion, and meet the minimum standards that other contemporary tools comply with. The bare minimum is to make public benefits accessible digitally. Interoperability must be the goal.

Public benefits are varied and complicated – but the benefits recipient experience should not reflect that complication (similar to many other modern day digital tools like payroll and health benefits software, that present easy-to-use interfaces for complicated functionality). Public benefits recipient should have:

- A single benefits application with auto-enrollment for anyone who applies that is found eligible
- A single log-in to access information about the benefit, or suite of benefits, they are receiving
- Transparency into how the benefits programs work and interact with each other
- Accessibility via phone, SMS, chat, email, and mobile and web, to check on applications, eligibility, benefits disbursement, ask questions, and more. This implies investment in improving customer support capacity and service as well.

Addressing Inequality: How policy is written

At Leap Fund, we believe that everyone receives benefits; including people from every income bracket and corporations. We view both SNAP and the mortgage tax credit as government benefits. The difference in these policies is around the trust and transparency that's built into the regulations. For middle and high income earners, policies reflect high trust and believing best intentions. For low income earners, policies reflect low trust and designing for the worst actors. This is how inequality is built into and codified in the policies. In visiting this issue holistically, there's an opportunity to ensure that the inequality is rebalanced.

3: Discuss benefits cliffs with public benefits recipients

Transparency about benefits cliffs is the government's responsibility, and more than a simple calculator tool. Every benefits agency across the country should not only utilize a benefits cliff calculator with their clients, but openly discuss the concept in general, and explore specifics about when or if a benefits cliff may occur for the recipient.

Designing tools with empathy: a cautionary tale

You won't find our calculator online through a web search – we've specifically embedded our program within coaching practices, so that there is a trained professional walking through the issue with the client. Given that benefits cliffs are not currently discussed with public benefits recipients, embedding within coaching is critical to combat the lack of awareness and transparency, as misinformation and rumor often fill that gap. We determined that if we put our

calculator online for anyone to self-serve, users would be left with questions or concerns about how this affects their ambitions and goals, but would have no one to discuss it with. This leaves someone with confusion, or worse, true anxiety and distress.

Assuming that a digital interface can stand in for an actual transparent and clear discussion of the benefits cliff issue is a mistake. There was an unfortunate example that occurred in 2020, that serves as a cautionary tale: a 20 year old man used the Robinhood investment app to learn about investing, misread the interface and thought he had lost close to a million dollars - he committed suicide out of fear and anxiety of the anticipated loss. As [Forbes](#) reported: “When he saw that \$730,000 number as a negative, he thought that he had blown up his entire future.” We know that the dollar amounts may be different for public benefits, but the urgency and fear about finances is the same. Acknowledging and discussing benefits cliffs is a necessary part of transparency.

Addressing Inequality: Employer dynamics

In the current environment, there should also be acknowledgement of the power dynamic employers may wield. If an employer were to utilize a benefits cliff calculator to make job-related decisions about employees without their knowledge, this puts the worker at a sincere disadvantage. Benefits cliff systems and their work impacts must be discussed and decided together with workers themselves.

4: Solicit stakeholders input continuously and iteratively

As we mentioned above, employers can be a critical part of the solution. As can CBOs, legislators, benefits agency administrators, retailers, tech industry builders, and public benefits recipients themselves. Soliciting feedback regularly can ensure you uncover risks and unanticipated problems at each stage of the process.

YOU CAN'T CHANGE WHAT YOU DON'T MEASURE

At the end of the day, our solutions are a band-aid for what is ultimately a policy failure, and needs to be fixed through policy. Knowing that you can't change what you don't measure, collecting data about benefits cliffs is a primary priority. With that data and understanding, decisions can be made on which areas to improve, including benefits cliff transparency while the issue exists and policy change to ensure it is solved, all while involving those most affected by the issue at each stage of inquiry.

I'm grateful for this opportunity to start talking through the questions that lead to solutions. We're happy to discuss our tools and solutions, learnings, and tech industry experience further. Thank you very much for your time.

Sincerely,

Karen Schoellkopf

ABOUT LEAP FUND

Leap Fund has seen workers across the country turn down income that they have earned at their jobs, out of fear of hitting the benefits cliff (where they stand to lose public benefits worth much more than a raise). We're creating products that empower optimism, financial and career growth, future planning, and security for the working families that need it most.

- 20-Year-Old Robinhood Customer Dies By Suicide After Seeing A \$730,000 Negative Balance, by Sergei Klebnikov and Antoine Gara, [Forbes](#), June 17, 2020

Dear Members of US House of Rules committee,

My name is Georgia Allen, I was born in Chicago, IL and raised and live in Madison, WI. I am a 36 year old single mom, now a middle class citizen who works audaciously to promote systems that allow everyone the pathway to self sufficiency.

Even before the pandemic the number of individuals/ families living in poverty, working poor were great and even greater now. Getting to the middle class for many means navigating the complicated world of how changes to wages, employer benefits, and public benefits eligibility impact net-income. This is becoming even more complicated as policies change to address the ongoing economic crisis.

Thank you for the opportunity to weigh in at this round table. Today I am going to share some of my personal experience and professional knowledge navigating benefits as a poverty/working poor class in the US.

As you have so graciously shared, food insecurity is interdependent upon an individual/ family's economic stability to obtain/maintain housing, childcare, quality education and healthcare. I learned a lot on my journey about what has/ hasn't worked when needing to utilize public benefits as you aspire to no longer depend on them and seek a path to the middle class.

In my case the ending Generational poverty cycle and disrupting Rules that promote benefit cliffs and decrease our intention of public benefits helping families achieve economic stability and no longer need to depend on them unless you have to.

My Story-

Growing up, my mom worked multiple jobs to support my 4 siblings and me and couldn't risk losing food share, healthcare subsidy and other critical support that her wages alone couldn't cover.

At age 16, I secured my first real job making minimum wage at Subway. It wasn't much money, but it put our combined family income above the eligibility limit for FoodShare, Medicaid, and other assistance, causing us to experience a benefits cliff. My job couldn't make up for these losses, so I had to quit.

When I became an adult and had a family of my own, I was better able to navigate my career path because I learned how to navigate resources by understanding what benefits were actually helpful and those that were contributing to my cycle of poverty.

The trauma experienced making daily decisions about meeting basic day to day needs (multiple jobs) and juggling the benefit cliff and all the health/behavioral challenges children in poverty experience don't leave room to pursue. Science has proven the short/long term physical, mental exhaustion that comes with survival. Those that navigate benefit cliffs over repeatedly without the right resources to feel the gap and no support after the cliff ultimately give up.. they feel trapped.

I know that from watching so many families including my own fall into the vicious trap in the cycle of generational poverty.

My contribution to disrupting the generational poverty cycle and helping communities of low wealth, collectively build wealth to invest in resources people need to fill the gap between a benefit cliff and economic stability.

I work audaciously to promote awareness within State entities, nonprofit organizations and for-profit companies to enhance resources through efficiency of community support to promote a strong economy and workforce.

Some of my social impact ventures in founding 2 low wage industry cooperative, home care and child care-

- SIC- worker owned home care agency to strengthen the wages, training, worker support and resources needed to ensure adults have access to quality care.
- Village Star Network is a family child care incubator that supports both formal/ informal providers with startup, maintenance of family care sites that serve low wealth/public assistance dependent families. The network provides access to around the clock childcare, career architecture, peer support, coaching and Public/ private benefit cliff navigation- w/ assistance of the Opportunity Calculator app I helped develop.

Sincerely,

Georgia Allen

United States House of Representatives Committee on Rules
Ending Hunger in America: A Conversation about Benefit Cliffs

Testimony of Pedro J. Perez, Executive Director – Charlotte Family Housing,
Charlotte, NC

Chairman McGovern, Ranking Member Cole and members of the Committee, and fellow panelists thank you for the privilege and opportunity to speak with you on the ongoing crisis of food insecurity, homelessness, and the benefits cliff. I bring my lived experiences of poverty and hunger. My mom raised me by herself because she had to divorce my father. He was violent and self-medicating because of the racism and trauma he experienced as Afro-Taino Indian. Years later, he sobered up and became a loving grandfather to my children. I know my mother went hungry so my brother and I could eat. I remember having only white rice and ketchup at the end of each month during our formative years. My mother did not speak English but quickly took steps to learn the language and obtain her GED. She then pursued and received her LPN- Associate Degree, then bachelor's degree to become a registered nurse, and finally earning a master's degree becoming a nursing administrator for the local New York City hospital. Our journey was long and arduous.

Sadly, my mother died from COVID last November. I followed my mother's example of work ethic and accomplishment; I followed my mother's example of work ethic and achievement; I earned a Master of Public Administration from Marist College. I rose to the rank of brigadier general in the New York State Police and served as interim superintendent during Governor Spitzer's and Paterson's administrations. During my tenure as NYS Trooper, I volunteered for nonprofits whose mission and focus was helping poor and marginalized families and communities lift themselves out of poverty. When I retired in 2010, I continued serving nonprofits, working as a leader the Capital District YMCA- Albany branch, City of Albany's My Brothers and Sisters Keeper Initiative, City of Albany Poverty Reduction Initiative, and now work for Charlotte Family Housing.

Charlotte Family Housing (CFH) is a shelter-to-housing program for working families experiencing homelessness. In 2011, three agencies, Charlotte Emergency Housing, Family Promise of Charlotte, and the Workforce Initiative for Supportive Housing-W.I.S.H., combined their resources and expertise to address the needs of working families experiencing homelessness to establish CFH. Our mission is to empower working families experiencing homelessness to achieve life-long self-sufficiency through shelter, housing, supportive services, and advocacy.

In each of these organizations, I saw firsthand the impact of poverty, homelessness, hunger, and the effect of the "benefits cliff" on the families I served. I watched working mothers and fathers making the heart-breaking choices like my mother made, trying to stretch their income to keep themselves stably housed and feed their families. Some families needed the support of SNAP and TANF. I also watch mothers and fathers refuse salary increases or promotions not because they were not interested in advancing but

because if they accepted the raise or promotion, these would not make up for what they lost in benefits as a direct result of the benefits cliff.

Hunger and food insecurity in the United States is still tragically high. There are an estimated [17 million hungry children now in America](#) – 6 million more than before the pandemic – and hunger in households with children is up by almost two-thirds. Children of color are [twice as likely](#) as white kids to face hunger. My home state of [North Carolina is tied with Texas](#) as the ninth hungriest state in the Union.

Ever since President Lyndon Johnson launched a set of domestic programs to end poverty and racial injustice, as a nation, we have tried to reduce (if not eliminate) poverty, homelessness, and disenfranchisement. Together, these programs made up much of [Johnson's War on Poverty and his Great Society](#) vision for the U.S.'s future. All these laudatory efforts were and are essential to our democracy and overall prosperity as a nation.

However, hidden within these programs were regulations creating consequences and barriers that prevent many people from finding a bridge out of poverty. Among these is the “benefits cliff effect.”

What is the benefits cliff effect?

A *benefits cliff* effect is what happens when public benefit programs phase out quickly when household earnings increase. The abrupt reduction or loss of benefits can be very disruptive for families because even though [household earnings have increased](#), they usually have not grown enough for self-sufficiency. The cliff effect happens to workers near the poverty line who are eligible for a variety of programs (e.g., food stamps, Medicaid, the Earned Income Tax Credit (EITC), Temporary Assistance to Needy Families (TANF), and subsidized public housing). The working poor reach a point where a dollar increase in their hourly wage can significantly reduce benefits. The outcome is that the added dollars will not make up for the loss of food stamps, childcare, or other benefits designed to help people in poverty or near poverty.

The steep reduction in benefits can discourage people from engaging in workforce development programs or from even seeking employment in the first place. Many people in poverty rely on a combination of earned income, public benefits, and community supports to survive. When these resources are unpredictable, people in poverty must choose which necessities or bills they will not buy or pay. Inconsistent access to nutritious food, medical care, safe housing, and childcare has detrimental effects on health and well-being. Here is an [example of the benefits cliff](#) from the Center for Social Policy, University of Massachusetts, Boston. This graph shows a situation where a higher

income means fewer resources overall:

For even [more on cliff effects](#), visit the Center for Social Policy's website.

The chart illustrates the dilemma of the benefits cliff. Raising the minimum wage to \$15 an hour (\$31,200 per year) would not solve the problem. It would depend on the "Area Median Income" (AMI) of the city or region. For instance, the AMI for Charlotte, NC, is about \$84,000. The regulations and the administration of public benefits are where the problem lies.

Yes, we must work to increase minimum wages and advocate for salaries that allow families to thrive, not just survive. And just as important as helping these families become self-sufficient is finding ways to mitigate, or better yet end, the negative impact of the benefits cliff. We must strive for this to happen if we are to reinforce and sustain the effectiveness of our poverty reduction initiatives.

What can States do about the benefits cliff?

Congress and state legislatures can consider the gradual reduction of benefits as salaries increase, turning the cliffs into gentle off-ramps, which would allow families to become and sustain self-sufficient over time.

There are states across the country that have taken steps to lessen the precipitousness of the cliff effect. For instance, according to this [article from The Aspen Institute](#):

- Colorado's Child Care Assistance Cliff Effect Pilot Program, most recently revised in 2016, is designed to "develop a revenue-neutral approach for each family as income rises. Evaluation efforts have sought to determine if the parents in the pilot program

changed their behaviors to be more likely to accept promotions, work additional hours, and take higher-paying jobs, all of which would result in increased income.”

- In 2017, Maryland’s Governor’s Executive Order 01.01.2017.03 created the Two-Generation Family Economic Security Commission and Pilot Program. Maryland’s pilot program mandates the linkage of programs and services to create opportunities and address families’ and children’s needs with a specific focus on early childhood education, elementary education, economic stability, and family engagement.

If we are to end generational poverty, we must encourage more states to adopt a [two-generation approach](#) that focuses on forging opportunities to address the needs of both children and adults. To understand the benefits cliff effect more fully, we must also investigate self-sufficiency.

The most precise definition of self-sufficiency is a family's income level that meets their basic needs without public aid. Many states are seeking ways to enhance and accelerate self-sufficiency by addressing the impact of the benefits cliff. These states have created self-sufficiency calculators that alert social services staff and their customers when income thresholds could cause an abrupt reduction in services. These states have also set the income thresholds where self-sufficiency begins.

Other states have set up or changed programs and regulations to reduce the negative impact of the cliff effect related to TANF:

- Increasing the threshold on assets tests or completely ending the assets test so families can open savings accounts. Alabama, Maryland, Ohio, and Virginia are four states that have completely done away with assets tests.
- Some states do not count vehicles as assets when calculating who is eligible for benefits.
- Arizona and six other states do not count child support benefits when [determining which families are entitled to TANF](#).
- New York allows one automobile up to \$12,000 fair market value. Furthermore, in the case of automobiles equipped for [individuals with a disability](#), the equipment is not considered to increase the value of the vehicle.

These essential incremental steps are not enough; we need to do more to create a bridge out of poverty. The following remedies are steps in the right direction:

- Align eligibility determination procedures, documentation requirements, and timelines across programs so that people do not lose all their benefits at once.
- Gradually decrease benefits for at least one year.
- Establish reasonable time frames for reporting changes in income and adjust regulations that will treat income from distinct types of employment differently in the benefit-determination calculations—for example, assessing overtime and temporary jobs individually not to penalize people unfairly.
- Provide warnings and conduct benefit-adjustment hearings before sanctioning a recipient for potential noncompliance with program requirements.
- Fund “benefits transition navigators” who will help individuals find and access all the public benefits and community-based supports available to them. In addition to case management, information, and referral services, the navigators can help people

understand options and consequences when balancing benefits, income, and community or social network supports.

- Conduct research on the effectiveness of coordination and other "cliff effect interventions" to provide quantitative evidence about cost efficiencies for programs and improved services and outcomes for individuals.
- Support the creation of a cross-agency "benefit coordination blueprint." This blueprint would help train program staff at the local level. It could also guide investments in technology and infrastructure to connect, as appropriate, data and information systems.

What can employers do about the benefits cliff?

Employers can help reduce the benefits cliff by educating themselves on the trade-off between employment and benefits, then create solutions for barriers to getting and keeping jobs. Concerned employers might consider the following:

- Dealing with social services agencies takes up a lot of time. Employers can accommodate time off or adjust schedules for employees to attend benefits hearings and otherwise troubleshoot coordination of government benefits.
- Network with other employers to help workers access childcare and other social supports.
- Bring Success Coaches from the [Employer Resource Network](#) on-site to aid employees with wraparound services on an ongoing basis.

What can community and faith-based organizations do about the benefits cliff?

Community-based and faith-based organizations are often the first line of defense and are increasingly the informal safety net for persons suffering economic hardships. While regularly overburdened with providing services, these entities can help address the cliff effect in the following ways:

- Supplement "benefit transition navigators" with a mobile "211" service that goes into neighborhoods to improve the availability of exact information about services and supports.
- Educate workforce development programs and employers about the barriers low-wage workers confront when taking part in education and training and about the trade-offs between meeting immediate needs and seeking socioeconomic advancement through employment.
- Facilitate collaboration across programs that serve low-wage workers.
- Support the continuation of task forces comprised of members from public and private sectors and state and local government agencies. The task forces should examine the range of issues affecting working persons in poverty, develop strategies to help them, and monitor the outcomes.

Poverty is intersectional, has many causes, and needs coordinated and sophisticated solutions, like reducing the cliff effect.

Why should we do anything at all about the benefits cliff?

The reason is straightforward: Families can find a bridge to economic self-sufficiency. Employees experience financial security for their children even when accepting raises, working overtime, and earning promotions, making them more likely to stay employed. This strategy will also help employers reduce the cost of employee turnover.

A coordinated and collaborative effort by government, businesses, community- and faith-based organizations, and the people themselves can create pathways to a sustainable and actual reduction in poverty rates. Such efforts will increase economic stability, reduce dependency on the government, improve child and family outcomes, and support economic development for the entire community.ⁱ

October 27, 2021

Chair McGovern, Ranking Member Cole, and Members of the Committee:

Thank you for the honor of speaking to you today about the relationship between benefits cliffs and economic mobility and resilience. My name is Brittany Birken and I am a principal adviser with the Federal Reserve Bank of Atlanta (Atlanta Fed). I am a member of the Atlanta Fed's Advancing Careers Initiative. The Advancing Careers Initiative works to improve workers' economic mobility and resilience by identifying how benefits cliffs can create financial disincentives to career advancement. We provide analytical tools and research that support solutions to those benefits cliffs and other structural financial barriers. We are currently engaged in benefits cliffs-related projects in numerous communities and states across the country, including the states of [Massachusetts](#), [Oklahoma](#), and [Texas](#); as well as other [partnerships](#) that may be of interest to members.

While sharing my expertise on the benefits cliffs today, I am speaking on my own behalf, and my views do not necessarily represent those of the Federal Reserve Bank of Atlanta or the Federal Reserve System.

Benefits Cliffs

I would like to begin by explaining why the Atlanta Fed is studying the impact of benefits cliffs on workers and the economy. Improving economic mobility and resilience is a key aspect of our community development responsibilities and is complementary to our monetary policy mandate to promote maximum employment. Economic mobility and resilience focuses on individual's ability to raise their standard of living and ultimately maintain financial household stability and wellbeing even through unexpected challenges in daily living. A core aspect of our work is to identify and understand the barriers that challenge economic mobility and inclusion.

Economic research has found that one such barrier can be benefits cliffs. Many major federal safety net programs such as food assistance, childcare assistance, and housing assistance are means-tested (that is, only individuals with income below certain thresholds are qualified). As workers advance in their careers and earn more money, the amount of support from safety net programs decreases. One significant barrier occurs when career advancement with relatively small increases in wage income puts a family above the income eligibility threshold for public assistance programs. Due to the loss of these programs, career advancement opportunities can result in the family being financially worse off (a benefits cliff) or no better off (a benefits plateau) than before the wage increase. These barriers can create a financial disincentive for career advancement, particularly when modest wage increases result in a loss of eligibility but are not sufficient for the family to meet their needs independently.

This loss of means-tested safety net support can mean that some workers have a financial disincentive to invest in their own human capital and advance from lower-wage work to jobs that lead to economic self-sufficiency. Ultimately, benefits cliffs may hamper the ability of workers to increase their income, accumulate assets, and improve their standard of living.

To illustrate this point, consider this true-life example. A single parent has two children younger than five. She works full-time and her employer offers her a .10 cent an hour wage increase. That nominal wage increase puts her over the threshold of eligibility for the childcare subsidy. Based on the childcare subsidy values in her state, the approximate \$200 in annual increased wages would result in the loss of about \$9,000 in childcare subsidy. She faces the dilemma of choosing between career advancement and the childcare subsidy which she needs in order to afford childcare for her young children and maintain employment.

A benefits cliff such as the one depicted here can be especially challenging if families lose eligibility to the public benefit program before they can afford the cost of goods and services independently without sacrificing other household budget items. Recent [research](#) on childcare benefits cliffs illustrates this challenge. Using Florida as a case study, it was determined that for a family of two adults and two young children, the size of the cliff at the eligibility threshold can be as high as \$16,000. The average two-adult and two-young-children family faces an annual financing gap of nearly \$11,000. Ninety-seven percent of the state's population live in counties where the amount of income needed for self-sufficiency is above the federal childcare subsidy eligibility threshold for this family type.

The Impact of Benefits Cliffs

While the example provided above is reflective of one public benefit program, it is important to consider the potential interaction of all core public benefit programs. Low-income families may access multiple public benefit programs depending on eligibility requirements, income, need, and availability (for those that have finite subsidy funding such as housing and childcare assistance). As workers advance in careers and earnings increase, the values of subsidies may be reduced and in combination this can also cause a reduction in net financial resources for the household.

Understanding the complexity of net financial resources can provide context on challenges associated with benefits cliffs. Net financial resources include the after-tax or net income. This is an individual or family's take home pay from work. It also includes any public assistance programs the family may qualify for. This includes tax credits, cash assistance, and in-kind benefits individuals or families may receive from the government. Subtracting typical family expenses like childcare, food, healthcare, housing, transportation, utilities, and other miscellaneous expenses provides a realistic estimate of the family's disposable income or net financial resources.

As income increases, the loss of public benefit programs may lead to a loss in net financial resources that makes a worker worse off than they were before the income gain. Based on [analysis](#) of net financial resources, depending on family composition and the public benefit programs accessed, it is possible that a family may be no better off with an income of \$51,000 than \$7,000.

Benefits Cliffs and Workforce Development

Included in the portfolio of Advancing Careers work is the focus on how benefits cliffs interact with local workforce and economic development strategies. Workforce development—job training and employment services that help individuals acquire credentials that employers demand, obtain employment, and increase their earnings—is an important component of broader strategies to promote economic mobility and supply businesses with skilled talent. Many individuals in workforce

development programs receive some form of public assistance. At some point along their advancing career path, these individuals will gradually or suddenly lose this public assistance and potentially face a benefits cliff.

Benefits cliffs may affect decisions related to career advancement or net financial resources in ways that ultimately have consequences for economic self-sufficiency. First, workers may turn down opportunities to advance in their careers due to public assistance losses. Second, the complexity of programs means families may struggle to accurately forecast when and how much public assistance they will lose as earnings rise. Unanticipated losses in public assistance may create financial instability for a family just at the time they are beginning a new career, jeopardizing their stable employment. Third, individuals may advance in their careers, but losses in public assistance reduce or eliminate potential gains in the family's total financial resources. Thus, the family's standard of living does not improve as much as expected given an increase in income. This last consequence has implications for how policymakers evaluate the effectiveness of their workforce programs. If policymakers evaluate workforce development programs by measuring gains in employment earnings alone, the analyses may find improvements in earnings, but will not reflect that the programs may not have improved the standard of living for families.

Mitigating Benefits Cliffs can be a Gain to the Worker and the Taxpayer

The Advancing Careers research also focuses on benefits cliffs from the perspective of government finances. Programs that support career advancement for individuals on public benefits not only help individuals by increasing their earnings, but they can benefit the larger public as well. Since these public benefits are taxpayer funded, helping individuals advance up a career pathway has implications for government finances. As individuals earn more, they contribute more to employment taxes and pay more in consumer taxes as they spend more. At the same time, governments spend less on public assistance programs as individuals move towards economic self-sufficiency. Atlanta Fed research has [estimated](#) large potential returns to taxpayers when workers on public assistance advance to higher earnings through career pathways.

Concluding Thoughts

The [negative economic impact](#) of COVID-19 on low-income families, together with longstanding concerns about rising poverty, economic inequality, and gaps in the social safety net, have increased attention on programs and policies that provide household financial stability and promote economic mobility. I have explained in this testimony and in sharing Atlanta Fed [research](#) how benefits cliffs can present a barrier to both economic mobility and household financial stability. Carefully designed policies and programs that address benefits cliffs may provide greater financial incentives for career advancement, increase financial stability for families as they transition off of public assistance, reduce the uncertainty workers face when trying to forecast how an earnings increase will affect their overall financial resources, and result in large potential returns to taxpayers.

To accomplish these goals, policies and programs would need to improve the short- and medium-term financial incentives of individuals to advance up their local in-demand occupations and career pathways. Atlanta Fed [research](#) describes how improved incentives can lead to substantial long-

term gains to both individuals and the public. If of interest, I can be available to members and staff to provide a demonstration of our tools and the analytical capabilities that demonstrate the interaction of public benefit programs and policies along various career pathways.

Thank you for the opportunity to share testimony today.

ON UNEVEN GROUND

ALICE and Financial Hardship in the U.S.

2020 NATIONAL REPORT

December 2020

WHAT IS UNITED FOR ALICE?

United For ALICE is a center of innovation, research, and action around financial hardship. At its core is **ALICE: Asset Limited, Income Constrained, Employed** – a measure of households that earn above the Federal Poverty Level but below the cost of household basics. The ALICE research drills down to the local level for both household incomes and costs, showing the mismatch between low-paying jobs and what it takes to survive financially, county by county and state by state.

This research is bolstered by external advisory committees of experts in fields ranging from health care and child care to labor and technology. The ALICE research team collaborates with a state-level committee in each partner state, and it draws on those experts nationwide for a biennial Methodology Review. This collaborative model ensures that all ALICE products and tools are based on unbiased data that is transparent, replicable, current, and incorporates local context.

With this data and research, ALICE partners convene, advocate, and innovate in their communities to highlight the issues faced by ALICE households, and to build solutions that promote financial stability.

KEY TERMS

ALICE: Asset Limited, Income Constrained, Employed – households with income above the Federal Poverty Level but below the basic cost of living.

Household Survival Budget: The cost of household basics (housing, child care, food, transportation, health care, and a smartphone plan, plus taxes and a small contingency). Calculated at the county level for various household types, including a **Senior Survival Budget**.

ALICE Threshold: The average income that a household needs to afford the household basics defined by the Household Survival Budget for each county.

Below ALICE Threshold: Includes both poverty-level and ALICE households – all households unable to afford the basics.

ALICE Essentials Index: A national standardized measure of the change over time in the costs of household basics included in the Household Survival Budget.

ON UNEVEN GROUND

Over the last decade, behind the veneer of a strong economy, conditions have actually gotten worse for millions of families across the U.S. — and that decline set the stage for the dual health and economic crises of the COVID-19 pandemic.

At the center of these crises is **ALICE**: households that are **A**sset Limited, **I**ncome Constrained, **E**mployed, with income above the Federal Poverty Level (FPL) but not high enough to afford essentials in the communities where they live. In 2018, of the 121 million households in the U.S., 16 million (13%) earned below the FPL, while another 35 million (29%) — **more than twice as many** — were ALICE.

Sources: ALICE Threshold, 2018; American Community Survey, 2018

That year, 42% of U.S. households could not afford the cost of household basics.¹

Official economic markers do not measure the realities that low-income families face — which essentials they need to live and work in the modern economy, and how the costs of those goods have changed over time. The most deceptive measure is the official measure of financial hardship, the Federal Poverty Level. The FPL was developed 50 years ago to measure the country’s progress in the War on Poverty, and its calculations have failed to keep up with changing conditions in a number of ways. For example, food is no longer 33% of a family budget, as the FPL first assumed, but closer to 15%; and a smartphone, which didn’t exist 20 years ago, is now essential.

Because the FPL’s methodology never changed, over time the threshold it set for poverty grew impossibly low — far below what any household actually needs to survive. The FPL has also not taken into account the varying costs of goods in different parts of the country (except Alaska and Hawai’i). And increases in the FPL have lagged far behind the rate of increase in the cost of the most essential household items.

The ALICE measures help fill these gaps, providing data to more accurately measure how many households are struggling. The Household Survival Budget and the ALICE Threshold reveal that ALICE households never recovered from the Great Recession. The ALICE Essentials Index shows that the cost of household basics continued to rise, and wages did not keep pace during the “recovery” from 2010 to 2018.

In addition, as work arrangements continue to shift risk to workers, causing shortfalls in hours and dependable benefits, life has become harder for ALICE families and those in poverty. As a result, rather than “recovering,” more households have actually moved closer to falling below the ALICE Threshold over the last decade, and ALICE families have not been able to rebuild or replenish their savings.

The year 2020 has been one of overlapping crises — the COVID-19 pandemic and an unfolding national economic slowdown, layered with regional natural disasters ranging from hurricanes, derechos, and tornados to unprecedented wildfires. And that confluence has been a perfect storm for ALICE households, who were already more vulnerable than ever before.

MEET ALICE: WORKING HARD BUT STRUGGLING TO SURVIVE

The daily challenges that ALICE families face – tough decisions and often no-win choices – are stressful and heart wrenching. ALICE workers, often unrecognized, keep our economy running, yet their struggles go uncharted by broad economic statistics.

Most ALICE households have adults who are working, primarily in low-wage jobs but also sometimes in higher-paid jobs that don't provide enough hours to support their family. Others work two or three jobs at once. Some of these households consist of families with parents looking for work or training for better jobs. Some are not able to work at all.

The core of the problem is a simple fact: The cost of household basics is higher than the wages of many of the most common occupations. The Household Survival Budget reports the cost of the essentials (housing, child care, food, transportation, health care, and a smartphone plan, plus taxes) needed to live and work in the modern economy. In 2018, the average annual budget for a family with two adults and two children in child care was \$67,476 – three times the FPL (\$25,100) ² and more than the median wages of each of the four most common occupations nationwide (Figure 1). For example, a family with both parents working full time – one in retail sales earning the median hourly wage of \$11.63, and the other in food preparation earning \$10.22 per hour – cannot afford this budget. A family with the next two most common occupations – office clerk (\$15.74 per hour) and cashier (\$10.78 per hour) – also falls short.³

Households below the ALICE Threshold are composed of all races/ethnicities, household types, and ages, and they live in all areas of the U.S. – urban, suburban, and rural. The demographic breakdowns of these households are highlighted here, and more detail is available on our website: UnitedForALICE.org/national-overview.

In 2018, in absolute terms, the nearly 51 million households **below the ALICE Threshold** – which include both ALICE households and those in poverty – were dominated by three groups:

Largest numbers:

- **Race/ethnicity:** White households (29 million)
- **Household type:** Single or cohabiting households with no seniors or children under the age of 18 (23 million)
- **Age:** Households headed by someone 45 to 64 years old (17 million)⁴

Overall, 42% of U.S. households were below the ALICE Threshold. But because some groups faced additional barriers to higher income, they also disproportionately faced financial hardship:

Largest percentages:

- **Race/ethnicity:** 60% of Black households, 57% of American Indian/Alaska Native, and 56% of Hispanic households were below the ALICE Threshold, compared to 36% of White and Asian households.⁵
- **Household type:** Single-female-headed families (77%) were more than three times as likely to be below the ALICE Threshold as married-parent families (22%).
- **Age:** The youngest households (headed by someone under age 25) and seniors (over 65 years old) were by far the most likely to be below the ALICE Threshold, at 70% and 50%, respectively.

Additional groups that face barriers to higher incomes include recent immigrants, especially those who are undocumented or unskilled; those with low proficiency in English or little formal education; lesbian, gay, bisexual, transgender, or queer (LGBTQ+) people; formerly incarcerated people; or those with a disability. Households facing more than one of these factors – recent immigrants with special needs, for example, who may have both limited English proficiency and a disability; or LGBTQ+ people of color, who face systemic racism and discrimination – are even more likely to experience financial hardship.⁶

Figure 2 shows that the mismatch between household income and expenses holds true across the U.S., with ALICE households living in every county in every state. For each state, the gold square shows the average percentage of households below the ALICE Threshold in 2018. The blue lines show the lowest-to-highest range of the percentage of households below the ALICE Threshold by county.

The extent of financial hardship varied from 31% of households in Alaska to 51% in Louisiana. There were even larger ranges within states, though some of the most extreme were in sparsely populated rural counties. For more details, go to UnitedForALICE.org/National-Overview.

YEARS IN THE MAKING: WHY 2020 HIT SO HARD FOR SO MANY

The national scope and prolonged duration of the COVID-19 pandemic has exposed the longstanding weaknesses in our economy. The pandemic has amplified the financial hardship that ALICE households and those in poverty already felt so acutely, and it has made them more vulnerable than ever. At the same time, it has exacerbated longstanding inequities in our society. This section outlines the seven reasons why the COVID-19 pandemic has hit so hard for so many.

1 ALICE NEVER RECOVERED FROM THE GREAT RECESSION

The number of ALICE and poverty-level households increased in direct response to the severe contraction of the economy during the Great Recession (Figure 3). From 2007 to 2010, the share of households in poverty increased from 12% to 14% (dark-blue line), and the share that were ALICE grew from 20% to 27% (medium-blue line).

Perhaps even more striking, the number of ALICE households continued to grow during the “recovery.” **From 2010 to 2018, the number of households in poverty actually decreased by 3%, leading many to believe the economy was improving for all. But the number of ALICE households continued to increase, growing by another 14%.** The rate of growth was even greater for some ALICE groups: 27% for Black households; 28% for American Indian/Alaska Native households; 33% for Hispanic households; 36% for Asian households; and 39% for Native Hawaiian and Other Pacific Islander households, compared to 13% for White, non-Hispanic households.⁷

Overall, from 2007 to 2018, there was a 38% increase in the number of households below the ALICE Threshold (poverty and ALICE combined – the dark-blue and medium-blue lines in Figure 3). This laid the groundwork for economic catastrophe in 2020, and two things accounted for it: the steadily rising cost of living, and the increasing dominance of low-wage jobs with less security.

Figure 3.
Households by Income, United States, 2007–2018

Sources: ALICE Threshold, 2007–2018; American Community Survey, 2007–2018

2 BASIC COSTS ARE RISING

The cost of goods that ALICE households buy on a regular basis is increasing faster than the overall rate of inflation as measured by the Consumer Price Index (CPI). The **ALICE Essentials Index** is a national standardized measure of the change over time in the costs of the household essentials included in the Household Survival Budget (housing, child care, food, transportation, health care, and a smartphone plan). **From 2007 to 2018, the average annual rate of increase in the ALICE Essentials Index was 3.4% in urban areas and 3.3% in rural areas, compared with a CPI increase of 1.8% (Figure 4).**⁸ This difference is primarily due to the fact that the costs of essentials – especially basic housing and health care – have increased, while the costs of other items that ALICE households are less likely to buy – notably manufactured goods, from apparel to cars – have remained relatively flat.

The cost of living is generally higher in urban areas; from 2007 to 2018, basic household goods were 18% to 22% more expensive in urban areas than in rural areas. Yet those costs increased at nearly the same rate in both areas. For more details, see the ALICE Essentials Index report at UnitedForALICE.org/Essentials-Index.

The increase in the cost of these basic goods may not be noticed by many consumers, but for ALICE households, it means that their already stretched income covers even less. ALICE's wages have not kept pace with rising costs; for example, from 2007 to 2018, ALICE workers in retail sales saw their wages increase from \$9.69 to \$11.63 – only 1.7%, about half the rate at which the ALICE Essentials Index grew.⁹ The impact is even starker for those who also depend on public assistance: Families with children reliant on the Supplemental Nutrition Program for Women with Infants and Children (WIC), or those with a disability who rely on Supplemental Security Income (SSI), are seeing the value of their benefits erode over time as costs rise.

Figure 4.
ALICE Essentials Index vs. CPI, United States, 2007–2018

Sources: ALICE Threshold, 2007–2018; American Community Survey, 2007–2018

3 MOST EMPLOYMENT GROWTH HAS BEEN IN LOW-WAGE JOBS

The number of low-wage jobs in the U.S. (dark-blue line in Figure 5) increased 63% from 2007 to 2018. These are jobs that cannot support the family Household Survival Budget (which includes costs for two adults, an infant, and a four-year-old), even with two people working full time, year-round. By 2018, they accounted for 40% of all U.S. jobs.

The number of medium-wage jobs (light-blue line), those that allow two parents working full time to afford a family Household Survival Budget, fell during the Great Recession, then rebounded after 2010, but never fully returned to pre-Recession levels. By 2018, these jobs accounted for 41% of all U.S. jobs.

During this same period, the number of high-wage jobs (gold line) – those that allow one worker to afford a family Household Survival Budget – declined overall, falling 27%.

There are also significant disparities in wages by race/ethnicity and gender. Notably, women earn 19% less than men, and Black and Hispanic workers earn 37% and 22% less, respectively, than White, non-Hispanic workers. Age and education level also play a key role, with younger workers earning less than older workers and income rising with level of education.¹⁰ Increasingly, there are also discrepancies between those who have jobs with secure, full-time work and those who are paid by the hour or project, where schedules are not regular and income is not dependable.

Figure 5.
Number of Jobs by Wage Level, United States, 2007–2018

4 ALICE WORKERS BEAR THE BRUNT OF ECONOMIC FLUCTUATIONS

Over the last decade, the economy has become more dependent on shifting risk to workers. Broader economic volatility – from changes in the price of materials and transportation costs, to impacts related to cyberattacks, natural and human-made disasters, and economic downturns – all directly impact workers’ schedules and wages.¹¹ Of the 258 million working-age adults (16 years and over) in the U.S. in 2018, 32% were paid hourly (Figure 6, middle column, dark blue segment).¹² Hourly paid workers include non-traditional workers within the gig economy, but also many in traditional jobs – especially in retail, health care, food service, and construction – and, increasingly, higher-wage workers who now work by the project or contract.¹³

Figure 6.
Labor Status by Race/Ethnicity, United States, 2018

Sources: ALICE Threshold, 2007–2018; Bureau of Labor Statistics—Labor Force Statistics, 2018

In addition to fluctuations in income, hourly paid workers face a range of challenges in meeting their basic needs each month. They are more likely to have multiple sources of income as they try to cobble together a full-time schedule from part-time jobs. They are often on their own in finding affordable technical support or navigating basic worker safety. They are also less likely to receive benefits such as health insurance, paid time off, family leave, or retirement benefits, especially if they work fewer than 30 hours per week at a single job.¹⁴

Black and Hispanic adults disproportionately work in hourly paid jobs: In 2018, this was the case for 41% of Hispanic workers and 37% of Black workers, compared to 31% of White workers and 26% of Asian workers (Figure 6).¹⁵ Despite the fact that the majority of adults in the U.S. were working in 2018 and most households had at least one worker, only 29% of all workers had the security of a full-time job with a salary. For Black and Hispanic workers, only 21% and 22%, respectively, worked in salaried jobs.¹⁶

“ Since ALICE is more likely to work in jobs that can’t be done remotely, many on-site, essential ALICE workers are more likely to contract COVID-19 while on the job. ”

Adding to the challenge of supporting a family is the large number of adults not working. While only 2% of adults were actively looking for work in 2018, almost 4 in 10 adults were outside the labor force (Figure 6, middle column, light-gold segment), the largest percentage since 1979.¹⁷

ALICE workers are the ones who have been hardest hit by the pandemic – both in terms of wage levels and hours available for those who are working, and in terms of the increased likelihood of becoming unemployed. Since ALICE is more likely to work in jobs that can’t be done remotely, many on-site, essential ALICE workers are more likely to contract COVID-19 while on the job. They are also more likely to work in the industries – food, hospitality, tourism – that have been hardest hit, so they have disproportionately suffered reduced wages and unemployment.¹⁸ These workers are more likely to be Black, Hispanic, and/or women, the same groups who are sustaining a disproportionate number of pandemic-related job losses and reduced wages.¹⁹

5 A GROWING NUMBER OF HOUSEHOLDS LIVE “ON THE EDGE”

For much of the last century, incomes across the income distribution grew at nearly the same pace. Then, beginning in the 1970s, income disparities began to widen. From 1979 to 2016, the average income for the top 1% increased over five times more than that of the middle 60% and over two and a half times more than that of the bottom fifth.²⁰ With that divergence in income has come a divergence in perception: 70% of Americans identify as middle class,²¹ yet one in three households in the middle three income quintiles do not earn enough to afford the ALICE Household Survival Budget.

Today, more households are on the edge of the ALICE Threshold than before the Great Recession. These families are one crisis – a rent increase, car breakdown, or decrease in work hours – away from becoming ALICE. Before the Great Recession, over 6 million households were just above the ALICE Threshold; by the end of the Recession in 2010, the number of ALICE households had increased by 8 million. Faced with reduced wages or unemployment during the COVID-19 pandemic, the 9 million households (8%) that were just above the ALICE Threshold in 2018 could now become ALICE.²² That would bring the total share of households below the ALICE Threshold to 50% – half of all U.S. households facing financial hardship.

6 ALICE EARNS TOO LITTLE TO SAVE, TOO MUCH FOR ASSISTANCE

Low wages make it impossible to save, yet they are often just high enough to keep families from receiving public assistance. As a result, many ALICE families suffer from a vicious cycle of budget shortfalls: A failure to pay bills on time leads to fees, penalties, and low credit scores, which in turn increase interest rates, insurance rates, and costs for other financial transactions (from check-cashing to credit card fees).²³ The costs of financial instability are cumulative and intensify over time.

Dreams to build for retirement or put a down payment on a house are dashed. If there is an emergency – anything from a car repair to a medical crisis – there is no savings safety net to fall back on. The lack of savings is widespread in the U.S: 42% of U.S. households had not set aside any money in 2017 that could be used for unexpected expenses or emergencies such as illness or the loss of a job.²⁴

Income disparities have led to even greater disparities in savings among households, especially by race/ethnicity. In 2017, two-thirds of Black households had assets valued at less than \$50,000, while only one-third of White households did (Figure 7). At the other end of the spectrum, 43% of White households had assets of more than \$250,000, compared to only 13% of Black households.²⁵

While ALICE families are not earning enough to afford basic essentials, their earnings are often too high to qualify for assistance. Only a small fraction of struggling families receive public assistance: 29% of households below the ALICE Threshold received assistance from the Supplemental Nutrition Assistance Program (SNAP) in 2018, down from 34% in 2012. An even smaller portion received Supplemental Security Income (SSI) (13%), or Temporary Assistance to Needy Families (TANF) (5%).²⁶ Without access to public assistance, ALICE families are left to make difficult and often heart-wrenching choices about how to make ends meet.

The pandemic is increasing these longstanding disparities in savings and assets. Out of necessity, low-income households are spending (wages, stimulus checks, unemployment benefits, and savings), while high-income households have actually increased their savings during this time.²⁷

Household Net Worth and Race/Ethnicity, United States, 2017

Source: U.S. Census Bureau—Wealth and Asset Ownership, 2017

7 ALICE IS MORE VULNERABLE TO NATURAL DISASTERS

From floods, hurricanes, and wildfires to pandemics, ALICE households disproportionately bear the impact of crisis and disaster. ALICE families feel the economic impact almost immediately – if they can't work, they lose pay; if there is damage to their home or car, there are immediate repair bills; and if the power goes out, they need money to replace spoiled food supplies.

ALICE households are more likely to live in housing units and communities that are more vulnerable to flooding, fire, and other hazards, primarily because those areas are more affordable. Yet ALICE families do not have the resources to withstand disasters. Often they cannot afford to make protective repairs, evacuate, or take necessary precautions during a public health crisis.²⁸ After a disaster, they take longer to recover, if ever: Because they are less likely to have insurance or savings to repair damage, it is harder to recover from illness, make housing repairs, and pay ongoing bills.²⁹

The increase in natural disasters and the COVID-19 pandemic in particular have also brought to the fore the striking health disparities between different racial/ethnic groups during crises.³⁰ For example, Black, Hispanic, American Indian/Alaska Native, and Pacific Islander individuals have contracted and died from COVID-19 at much higher rates than Whites.³¹ Nationally, as of November 12, 2020, the age-adjusted death rate of Blacks from COVID-19 was 3.0 times higher than that of Whites. Other groups that are smaller and therefore less likely to receive national media attention, including American Indians/Alaska Natives and Pacific Islanders, have mortality rates 3.2 and 2.3 times higher than Whites, respectively. In Arkansas, which has a large Marshallese community, the death rate among Pacific Islanders is a shocking 48 times higher than among Whites.³²

“ALICE households are more likely to live in housing units and communities that are more vulnerable to flooding, fire, and other hazards, primarily because those areas are more affordable.”

At the same time that ALICE workers face these sharply increased risks, they are also essential to the pandemic recovery, as well as to rebuilding from other recent natural disasters. ALICE workers are “Maintainers,” working in occupations that build and repair the infrastructure and educate and care for the past, current, and future workforce.³³ In these roles, they are the pandemic “heroes,” the workers essential to caring for COVID-19 patients and to keeping the economy running by working in food service, grocery stores, and warehouse and fulfillment centers. Yet they receive low wages and little protective gear to keep them and their families safe.³⁴ In the aftermath of hurricanes and wildfires, ALICE workers are essential for debris removal, housing repairs, and rebuilding basic infrastructure. Yet these jobs are nearly impossible to do if workers and their families are in crisis themselves.

AN ESCALATING CRISIS IN MEETING BASIC NEEDS

Not only has the COVID-19 pandemic exposed disparities and vulnerabilities that have long existed in our communities and our society, but it is widening these gaps in profound and interconnected ways, with major impacts on the lives and well-being of households across the United States. This section outlines and highlights ways in which the pandemic has contributed to wider and more deeply entrenched disparities across the ALICE Survival Budget areas. As the impacts of the pandemic are still unfolding, these examples represent conditions at the time this Report was released (December 2020). For regularly updated content on the impact of COVID-19 on ALICE households, visit our website at UnitedForALICE.org/COVID19.

Overall, many households are now seeking public assistance for the first time, and getting assistance for all of these most basic resources can be a difficult and stigmatized process.³⁵ To learn more about the difficult decisions ALICE households face, see United For ALICE's 2019 Report, *The Consequences of Insufficient Income*, at UnitedForALICE.org/Consequences.

Housing is the cornerstone to stability, but it is also the most expensive item in many household budgets. Without safe, affordable housing, families cannot maintain stability in other areas of life, including school and work, and access to health care and healthy food.

HOUSING

Where we live matters; it impacts current and future health and economic well-being.³⁶ Many ALICE households spend a disproportionate amount of their income on housing, limiting their ability to afford other essentials and setting the stage for vulnerability during a crisis.³⁷ Before the pandemic, the number of severely rent burdened households (with rent accounting for more than 50% of their income) was already rising, and that number is projected to grow by at least 11%, to 13.1 million households, by 2025.³⁸

In order to get by, families have to make tough decisions, which often include renting or buying substandard housing that is more susceptible to damage from environmental impacts. By necessity, they may have to borrow at unsustainable rates; have to live in less desirable locations, including unsafe communities and neighborhoods with lower-quality schools, older infrastructure, or a dearth of health care and grocery stores; or have to choose housing that is far from work, leading to longer commutes and higher transportation costs.³⁹

In addition to insufficient income, many households face other barriers to quality housing and prosperous communities, including discrimination and institutionalized racism. In 2018, there were over 31,000 reported acts of housing discrimination nationwide — up 8% from the prior year, and a record high since these statistics were first reported in 1995.⁴⁰ Significant racial disparities still exist in homeownership in particular: In 2018, the homeownership rate was 43% for Black households and 47% for Hispanic households, compared to 73% for White households.⁴¹

The importance of housing as a foundation for both health and financial stability has been made even clearer by COVID-19. The potential number of evictions is at a near-record high, and those living in crowded conditions with lack of space to social distance are disproportionately contracting — and dying from — the virus.⁴² In addition, Black and Hispanic renters have been more likely to fall behind in rent and to face eviction, and Black and Hispanic owners have been more likely to miss or defer mortgage payments during the pandemic.⁴³

Child care is essential for parents to work and children to be prepared for school. Education is one of the best predictors of financial well-being. Yet for families with two children in child care, it is the most expensive item in the family budget, and ALICE families face challenges finding quality education at every level.

CHILD CARE

With working parents making up approximately one-third of the U.S. workforce, child care has become a critical component of the economy as well as a key factor in child development.⁴⁴ Yet the child care sector, the workforce behind the workforce, has been facing economic challenges for the last decade. The lack of affordable, accessible child care costs the U.S. economy an estimated \$57 billion annually in lost productivity, revenue, and earnings.⁴⁵

At the start of the pandemic, virtually all child care centers and schools closed. Even with partial re-opening and distance learning, the long-term impact on children, parents, child care providers, teachers, and the economy has already been severe:

- **Children:** Early learning opportunities are key to closing educational achievement gaps by income or race/ethnicity. Diminished access to these programs and to quality K–12 education will exacerbate existing educational inequities in the long term. Childhood learning is strongly associated with lifetime earnings, with each school year linked to an average of about 10% higher income.⁴⁶
- **Parents:** Parents are juggling work (remote and in-person) and child care in new ways, with the greatest impact on women and parents in less flexible, lower-income jobs — often to the detriment of both parents and children.⁴⁷
- **Child care providers:** Temporary closures and reduced income are taking a lasting toll among child care workers. The Center for American Progress estimates that nationwide, almost 4.5 million child care slots could be lost permanently due to the pandemic.⁴⁸ Between February and April 2020, 370,600 child care workers — 95% of them women — lost their jobs, and by July, only 42% of those jobs had returned.⁴⁹
- **Public school teachers and districts:** With states facing dire budget shortfalls on top of difficult and changing work conditions, there could be a more than 8% reduction in the teacher workforce.⁵⁰
- **The economy:** Without functioning child care and K–12 education for working families, neither local economies nor the national economy can recover.

Food is the most basic of all needs. In the short term, food is the easiest place for a family to skimp on cost, but in the long term, the consequences of a poor diet or food insecurity can include developmental delays in children, compromised performance at school or work, and chronic disease in adults.

FOOD

A healthy diet is basic to good health and daily functioning, and is often taken for granted in a country with vast agricultural resources. Yet access to affordable, high-quality, healthy food continues to be a challenge for many households nationwide. No community is immune to this problem; there are individuals in almost every U.S. county who are food insecure. By 2017, estimates were that up to 18% of the U.S. population lived in a food desert, without sufficient access to a grocery store.⁵¹

When ALICE and poverty-level households do not have enough money for food, they often have no alternative but to buy less food or less healthy food. In 2014, almost 80% of food-insecure families in the U.S. reported purchasing inexpensive, unhealthy food; more than half ate food that was past its expiration date; and 40% watered down their food or drinks. Food insecurity affects health, which impacts school performance, work productivity, and levels of chronic stress.⁵² Short-term effects of food insecurity include fatigue and reduced immune response; in the longer term, there can be developmental, psychological, physical, and emotional harms.⁵³

Food insecurity has increased significantly in 2020. During the first few months of the pandemic, food insecurity doubled nationwide and almost tripled for households with children, and 7% of households reported that they received free food.⁵⁴ Meals and snacks from schools or child care centers, many of which have been closed during the pandemic, typically provide up to two-thirds of children's daily nutritional needs and save families at least \$30 per week per child. Senior food insecurity is also on the rise, up almost 60% from the pre-COVID rate.⁵⁵ Many ALICE households have turned to food pantries/banks, as they are one of the few social services that do not require income verification; ALICE families often earn too much to qualify for SNAP.⁵⁶

Transportation is necessary to get to jobs, housing, grocery stores, child care, school, health care services, and social events. Although public transportation is cheaper, it is not available in many communities. That makes owning a car essential for many — but it is a purchase most ALICE families struggle to afford.

TRANSPORTATION

ALICE households depend on reliable transportation in order to reach jobs, schools and child care, health care, stores, and more. Yet access to transportation is a significant barrier for many ALICE families. Because public transportation is not available in most parts of the U.S., owning or leasing a vehicle is necessary. A car is the most common asset in the U.S., but many lower-income families must buy lower-priced, used vehicles that are usually less fuel-efficient, tend to break down, and need more frequent repairs, which increases expenses. This, in turn, can lead to tardiness or absenteeism at work; missed medical, dental, or social service appointments; limited child care and school options; and limited access to healthy food.⁵⁷ These factors further push ALICE families to the brink of financial instability and make it harder to catch up. That situation is then compounded by crises like the pandemic: In August 2020, for example, 4.3% of auto loan accounts were in hardship, up from 0.5% in April 2019.⁵⁸

Public transportation, when available, is a vital service, especially for lower-income commuters who do not have vehicles. Yet due to COVID-19, many buses, trains, subways, and light-rail lines have had to limit service; overall ridership was down 58% from July 2019 to July 2020.⁵⁹ During the start of the pandemic, many services were cut to protect drivers and workers, with an almost 90% drop in ridership. Public transportation that was already struggling financially will have difficulty reinstating services, even after rider demand increases, as the primary sources of funding — fares, local sales taxes, parking tickets, and other fines — all took a hit during the pandemic.⁶⁰

Health care is often linked to financial hardship. Depending on age, illnesses, and overall health, costs vary widely between families. There are still millions without insurance and even more who cannot access health care due to cost, gaps in service, and scheduling issues.

HEALTH CARE

Poor health can be both a consequence and a cause of financial instability. When basic needs are not met, ALICE and poverty-level families are more likely to face health problems. Access to care; economic factors like employment and income; and environmental factors like housing, air/water quality, and community safety are the primary determinants of health. Individual health behaviors (like diet and exercise) only account for about 30% of health outcomes.⁶¹

Due to lack of health insurance coverage, many families forgo preventative care and become more likely to have an ongoing chronic condition.⁶² A serious health emergency can also lead to a downward financial spiral: Two-thirds of all bankruptcies in the U.S. between 2013 and 2016 were tied to medical issues – because of either high costs for care or time out of work.⁶³

The health impacts of COVID-19 are the most obvious outcomes of the pandemic, not just in terms of fatalities – total U.S. deaths had passed 269,000 by November 2020 – but also in highlighting disparities in health care quality, access, affordability, and the profound effects of institutionalized racism and discrimination. Many low-wage employees have not been provided sufficient safety equipment, resulting in greater exposure. This is especially true for those working in retail, warehousing, restaurants, hotels, pharmacies, hospitals, and nursing homes, with perhaps the most egregious exposure among workers in meatpacking plants.⁶⁴ For all of these reasons, those with the lowest incomes have incurred the greatest number of serious COVID-19 infections.⁶⁵ Similarly, people of color are also at a sharply increased risk of infection, severe illness, and death from COVID-19.⁶⁶ Older adults are at an increased risk as well, and half of U.S. senior households were already unable to afford the basics, much less increased health costs.⁶⁷

The pandemic is also widening health disparities by reducing access for those who need it most, through both hospital closures and growing reliance on telemedicine. The health care costs of the pandemic are adding more pressure on already struggling hospitals, forcing many in rural and low-income communities to close. The alternative – telemedicine – has grown exponentially. Yet for rural or low-income families, or communities without reliable internet services or digital devices, this trend further reduces access to health care.⁶⁸

Technology is an essential need in the modern economy. Without access to basic technology like a smartphone plan, ALICE faces disadvantages in job searches and performance, school work, accessing public benefits, and health care.

TECHNOLOGY

Even before the pandemic, access to technology varied significantly by income and geography – a reality often referred to as the “digital divide.” Across the U.S., 31% of households with income below the ALICE Threshold do not have an internet subscription, compared with only 8% for households above the ALICE Threshold. Rates of access also vary widely by location, for reasons of both availability and cost: The lowest access rates are in rural counties often not covered by high-speed internet service, and where 41% of households below the ALICE Threshold do not have an internet subscription.⁶⁹ For many, that lack of access translates directly to reduced job opportunities, educational opportunities, and access to health care and financial tools.

Because of COVID-19, the digital divide is more exposed than ever – and it is growing. The pandemic is forcing a wide range of workers to utilize new technology platforms, work remotely, and use technology to report and analyze data.⁷⁰ ALICE workers are less likely to have access to the internet and digital devices, and therefore less likely to have these skills or the opportunity to develop them, limiting the types of jobs available to them during the pandemic as well as their longer-term career possibilities. **Low-wage workers are six times less likely to be able to work from home than higher-wage workers.** And increasingly, many of the permanent job losses resulting from the pandemic are in occupations at high risk of automation – particularly those held by already vulnerable workers of color. ALICE workers without digital skills and resources face tougher job prospects ahead.⁷¹

By increasing the digital divide, the pandemic is also increasing the educational divide. Remote learning is hard for many, but it is even harder for those without access to reliable, high-speed internet and computing devices, not to mention space and quiet to participate in classes. For example, teachers and students have reported working outside of fast-food restaurants or other places with free Wi-Fi in order to attend remote classes.⁷²

Additionally, technology plays a critical role in relaying government and news alerts about natural disasters and evacuation orders. In an emergency scenario, slow internet speeds or lack of access altogether can be life-threatening for households living below the ALICE Threshold.

Taxes are an additional expense for ALICE. Because most ALICE households are not eligible for public assistance, they are net contributors and, on average, pay a higher rate of taxes than households in the highest income bracket.

TAXES

While headlines often feature low-income households receiving government assistance, ALICE households are net contributors and pay about 22% of what they earn in income, property, and payroll taxes. Workers, including ALICE, bear the greatest burden of taxation, paying for the majority of government revenue through taxes on labor — individual income taxes account for 47% of government revenue and payroll taxes for 33%. By contrast, taxes on wealth — property taxes, capital gains taxes, and corporate taxes — contribute less than 20% of government revenue, even though wealth cushions households and can be leveraged to help them build even more wealth and access to tax shelters.⁷³ Overall, the federal income tax structure in the U.S. is progressive (those earning higher incomes pay a higher rate of tax). However, this is generally not the case for state, local, payroll, and sales taxes, which are regressive. **Nationwide, the lowest-income taxpayers (the 20% of households with the lowest income) pay state and local tax rates that are over 50% higher than the top 1% of households.**⁷⁴

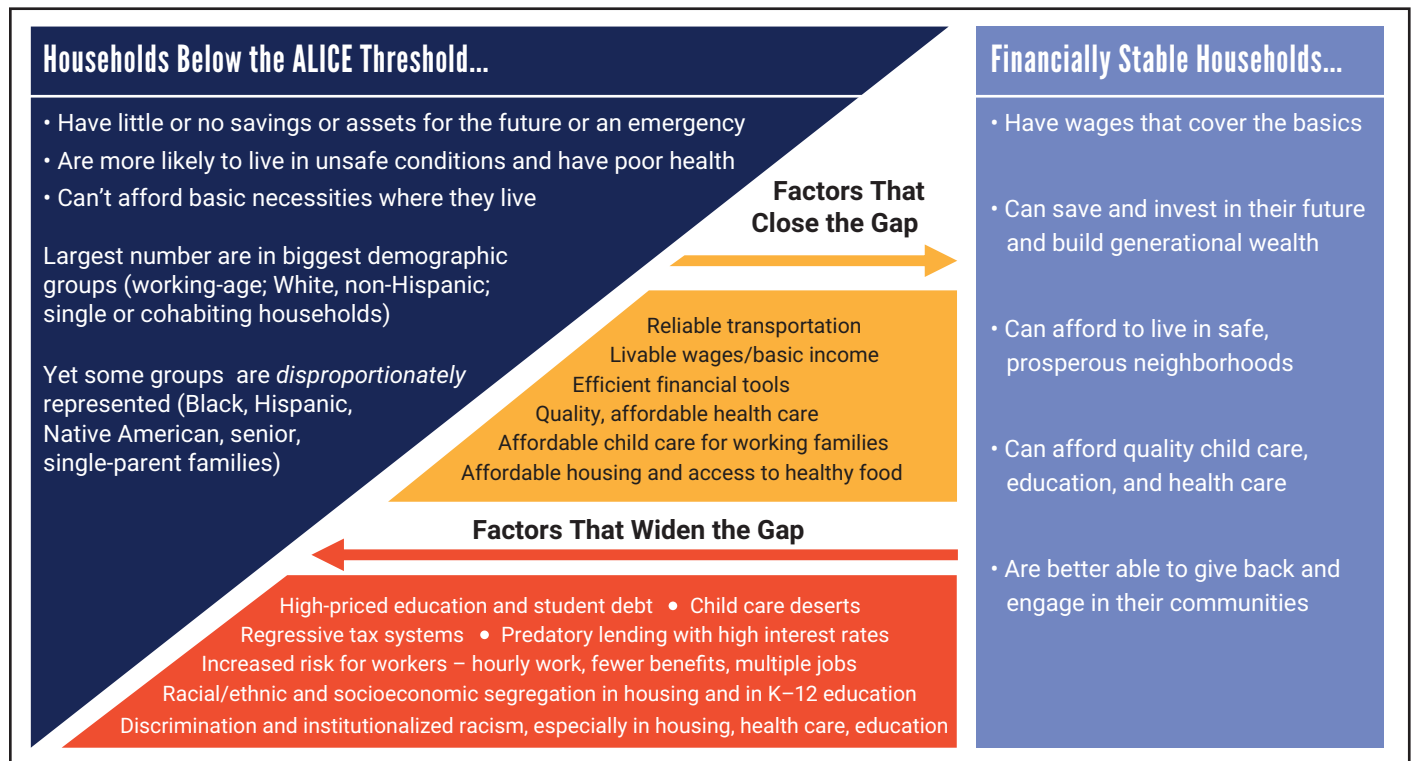

The pandemic has made things more difficult for low-income taxpayers. With many free tax-preparation assistance sites closed, and potential challenges in finding internet access, many have found it harder to file their taxes and receive credits, such as EITC and the child tax credit. Not filing taxes or updating tax return information also delayed stimulus checks for many.⁷⁵

BEYOND RECOVERY: A VISION FOR FINANCIAL STABILITY

This Report shines a spotlight on a system that leaves more than two in five American households struggling to make ends meet. In 2018 – even before 2020’s pandemic and natural disasters – a total of 51 million households were below the ALICE Threshold. United for ALICE research makes it clear that the status quo is not working for millions of households, and the COVID-19 pandemic has pushed our communities and economy to a tipping point. During this period of crisis, not only are families dealing with imminent risks to health and safety, but many are facing reduced wages or unemployment and are forced to deplete savings, accumulate debt, and make other sacrifices just to get by. And when eviction moratoria, renter payment plans, and mortgage forbearance end, many of these families will not be able to pay backlogged balances and will risk losing their homes. Without substantial intervention, it is likely that the 9 million households who were just above the ALICE Threshold in 2018 will become ALICE. **This means that half of all U.S. households could be in poverty or be ALICE by the end of the pandemic.**

Now is the time to reimagine this system, create new policies and institutions, and ensure that all households earn enough to meet their basic needs. This moment calls for significant action; it is a critical juncture where the decisions we make will shape the path of the future economy.⁷⁶ To make these crucial decisions, it is important to first examine both the barriers to and facilitators of financial stability. The factors that work to widen or close the gap between living below the ALICE Threshold and being financially stable are outlined in Figure 8.

Figure 8.
Closing the Gap: Moving ALICE Households Toward Financial Stability

Note: Sources for this figure are included following the Endnotes for this Report

NEXT STEPS: A VISION FOR ALICE

Intervention is needed across the board — in business, government, nonprofit, and educational institutions — not just to recover, but to set the groundwork for a more equitable future. Current policy is primarily designed to fill short-term needs for basic survival; it is not designed to bring families to financial stability, much less to ensure a sustainable future.⁷⁷ As a result, the amount of public assistance households receive, even when added to wages (more than half of government spending on assistance for low-income households goes to working families), falls far short of what is actually needed. An economy where half of all households cannot buy even basic necessities cannot sustain economic growth.

Overcoming the magnitude of financial hardship, the extent of the structural imbalance between costs and wages, and the depth of institutional racism will require decisive action. The ALICE framework and data can provide the underpinnings necessary to guide this process in three key ways:

- **Include ALICE at the table:** ALICE needs to be included in the policymaking process at all levels. These firsthand voices provide an often ignored perspective. It is important to hear stories of ALICE's lived experience — of struggles, triumphs, and navigating the very systems that policymakers aim to improve. Putting a face to this experience is key to reaffirming the inherent worth and dignity of all, regardless of income. ALICE can also share real-time problems, which can inform priority areas — for example, identifying where there are child care or food deserts, where public transportation routes or timetables limit employment opportunities, which health centers engage in discriminatory practices, or where housing is unsafe. ALICE voices can be heard when policymakers and business leaders who have themselves been ALICE share their experiences; when workers participate in workers' councils, unions, or policy convenings about "the future of work"; and when ALICE participates in their community and votes: ALICE and poverty-level voters make up more than one-third of the electorate.⁷⁸
- **Use ALICE measures:** Inequities can only be addressed if disparities are identified and tracked over time. The ALICE measures provide the necessary tools and data to better gauge the health of the overall economy. Specifically, it is time to replace the FPL. The Household Survival Budget provides a more realistic estimate of the local cost of basics for every county in the country; the ALICE Threshold then provides a more accurate measure of how many households are struggling financially; and the ALICE Essentials Index shows how costs are growing over time. Using these measures together is critical to accurately portray the scope of financial hardship and which demographic groups are disproportionately impacted, as well as to ensure that policy reflects the growth in the cost of essential goods over time.
- **Make data-informed decisions:** Good data is the essential foundation for effective policy. ALICE measures can also be explored along with the location of key community resources, and analyzed alongside data on health, education, and social factors. To address pressing, immediate needs, mapping ALICE with community resources shows where gaps exist so that stakeholders can direct assistance to those areas. To address more ingrained, interconnected challenges, ALICE data can be compared with other indicators such as food insecurity, internet access, life expectancy, grocery-store access, rent burden, and homeownership. This analysis can help identify underlying causes of hardship and barriers to mobility, as well as highlight areas of success. In addition, the Census is a key metric for the ALICE Threshold; an accurate Census count is especially important for small groups. The marginalization of disadvantaged groups has traditionally started with undercounting them, from enslaved Africans who were counted as 3/5 of a person to American Indians/Alaska Natives who were undercounted in the last three Censuses: by 12% in 1990, 0.7% in 2000, and 5% in 2010.⁷⁹

“ALICE needs to be included in the policymaking process at all levels.”

Knowing where ALICE households live can help federal, state, and local governments target preparation, response, and assistance for natural disasters and public health crises. Because ALICE households and communities do not have the same resources as their wealthier counterparts, such as insurance or savings, local responders know they will need more assistance over a longer period of time.⁸⁰ In addition, knowing which customers are ALICE can help companies plan where to develop new products; knowing which employees are ALICE can help employers deploy new skills training and strengthen career paths.⁸¹ And finally, understanding which patients are ALICE can help health care providers not only address presenting health issues, but work with community stakeholders to confront the underlying problems.⁸² (To see examples of ALICE data mapped with key indicators visit UnitedForALICE.org/indicators/New-Jersey.)

Our **Vision for ALICE** is a country where ALICE families not only have sufficient income to afford the basics but can also save and invest in their future. Having enough income for safe, affordable housing, quality child care, adequate food, reliable transportation, quality health care, and sufficient technology not only has the immediate impact of fulfilling essential needs, but it also has a ripple effect across all aspects of life for ALICE households (Figure 9). It means that households can build their credit scores and avoid late fees, predatory lending, and higher interest rates.⁸³ That, in turn, means that families have more resources to use to reduce risks (e.g., by purchasing insurance), stay healthy (e.g., by getting preventative health care), or save and invest in education or assets that could grow over time (e.g., by buying a home or opening a small business). Instead of a downward cycle of accumulating fees, debt, and stress, families can have an upward cycle of savings and health that makes them even better able to be engaged in their communities and, in turn, enjoy a reasonable quality of life.

When ALICE households can afford the basics, there is a significant positive impact on local communities and the wider economy. Financial stability leads to greater economic activity, greater tax revenue, lower levels of crime, and fewer demands on the social safety net, allowing more investment in vital infrastructure, schools, and health care (Figure 9).⁸⁴ This is a vision not only for ALICE, but for the nation as a whole.

Figure 9.
Benefits of Meeting Basic Needs

If households have sufficient income for...	Impact on ALICE Households	Impact on the Community
 Safe, Affordable Housing	Improved health through safer environments and decreased stress, improved educational performance and outcomes for children, greater stability for household members, a means to build wealth for homeowners	Less traffic, lower health care costs, better maintained housing stock, lower crime rates, less spending on homelessness/social services
 Quality Child Care and Education	Improved academic performance, higher lifetime earnings, higher graduation rates, improved job stability/access for parents, better health	Decreased racial/ethnic and socioeconomic performance gaps, decreased income disparities, high return on investment (especially for early childhood education)
 Adequate Food	Decreased food insecurity, improved health (especially for children and seniors), decreased likelihood of developmental delays and behavioral problems in school	Lower health care costs, improved workplace productivity, less spending on emergency food services
 Reliable Transportation	Improved access to job opportunities, school and child care, health care, retail markets, social services, and support systems (friends, family, faith communities)	Fewer high-emissions vehicles on the road, more diverse labor market, decreased income disparities
 Quality Health Care	Better mental and physical health (including increased life expectancy), improved access to preventative care, fewer missed days of work/school, decreased need for emergency services	Decreased health care spending and need for emergency services, fewer communicable diseases, improved workplace productivity, decreased wealth-health gap
 Reliable Technology	Improved access to job opportunities, expanded access to health information and telemedicine services, increased job and academic performance	Decreased “digital divide” in access to technology by income, increased opportunities for civic participation
 Savings	Ability to withstand emergencies without impacting long-term financial stability and greater asset accumulation over time (e.g., interest on savings; ability to invest in education, property, or finance a secure retirement)	Greater charitable contributions, less spending on emergency health, food, and senior services

4 Note: The groups shown in the following text overlap across categories (age, household type, race/ethnicity); households are counted in all relevant groups. Within the race/ethnicity category, all racial categories except Two or More Races are for one race alone. Race and ethnicity are overlapping categories; in this Report, the Asian, Black, Hawaiian (includes other Pacific Islanders), and Two or More Races groups may include Hispanic households. The White group includes only White, non-Hispanic households. The Hispanic group may include households of any race. Because household poverty data is not available for the American Community Survey's race/ethnicity categories, annual income below \$15,000 is used as a proxy.

5 Note: "...Black or African American: A person having origins in any of the Black racial groups of Africa. It includes people who indicate their race as "Black or African American," or report entries such as African American, Kenyan, Nigerian, or Haitian.

American Indian and Alaska Native: A person having origins in any of the original peoples of North and South America (including Central America) and who maintains tribal affiliation or community attachment. This category includes people who indicate their race as "American Indian or Alaska Native" or report entries such as Navajo, Blackfeet, Inupiat, Yup'ik, Central American Indian groups, or South American Indian groups...

Native Hawaiian and Other Pacific Islander: A person having origins in any of the original peoples of Hawaii, Guam, Samoa, or other Pacific Islands. It includes people who reported their race as "Fijian," "Guamanian or Chamorro," "Marshallese," "Native Hawaiian," "Samoa," "Tongan," and "Other Pacific Islander" or provide other detailed Pacific Islander responses.

Two or More Races [to keep to style]: People may choose to provide two or more races either by checking two or more race response check boxes, by providing multiple responses, or by some combination of check boxes and other responses. For data product purposes, "Two or More Races" refers to combinations of two or more of the following race categories: "White," "Black or African American," "American Indian or Alaska Native," "Asian," "Native Hawaiian or Other Pacific Islander," or "Some Other Race." (U.S. Census Bureau, Population Estimates Program (PEP). (n.d.). Race. Retrieved from <https://www.census.gov/quickfacts/fact/note/US/RH1425219>)

Hispanic or Latino: "Person of Cuban, Mexican, Puerto Rican, South or Central American, or other Spanish culture or origin regardless of race." (U.S. Census Bureau. (n.d.) About Hispanic origin. Retrieved from <https://www.census.gov/topics/population/hispanic-origin/about.html#:~:text=OMB%20defines%20%22Hispanic%20or%20Latino,or%20origin%20regardless%20of%20race.>)

6 Note: Collectively, LGBTQ+ people are more likely to live in poverty compared to straight cis-gender people. However, there are important within-group differences. For example, transgender people and bisexual cisgender women experience the highest rates of poverty, while gay cisgender men — particularly those in married couples — are less likely to have low incomes than other LGBTQ+ groups.

51 Note: In 2019, 13.7 million households (10.5% of the total population) were food insecure, including 13.6% of households with children; in total, 35.2 million people lived in food-insecure households. The prevalence of food insecurity varies by region and state, ranging from 11.2% in the South to 9.6% in the Northeast, and from 6.6% in New Hampshire to 15.7% in Mississippi. Food insecurity is more common among certain groups, including households with children headed by a single women (28.7%) or man (15.4%); households with income below 185% of the FPL (27.6%); Black, non-Hispanic households (19.1%); and Hispanic households (15.6%). There is also growing food insecurity among college students. A survey of U.S. college students administered in 2019 found that 39% of respondents were food insecure in the 30 days prior to taking the survey, with higher rates for students who are female (41%); Hispanic/Latinx [note here that Latinx not matching style—should be clear in style guide whether Latinx is preferred and in which areas of the report] (47%); gay or lesbian (47%); bisexual (50%); transgender (52%); parenting (53%); and indigenous (60%).

THE PANDEMIC DIVIDE:

An ALICE Analysis of National COVID Surveys

OCTOBER 2021

WHAT IS UNITED FOR ALICE?

United For ALICE is a driver of innovation, research, and action around financial hardship. At its core is **ALICE: Asset Limited, Income Constrained, Employed** – a measure of households that earn above the Federal Poverty Level but below the cost of household basics. The ALICE research drills down to the local level for both household incomes and costs, showing the mismatch between low-paying jobs and what it takes to survive financially, county by county and state by state.

This research is bolstered by external advisory committees of experts in fields ranging from health care and child care to labor and technology. The ALICE research team collaborates with a state-level committee in each partner state, and it draws on those experts nationwide for a biennial Methodology Review. This collaborative model ensures that all ALICE products and tools are based on unbiased data that is transparent, replicable, current, and incorporates local context.

With this data and research, ALICE partners convene, advocate, and innovate in their communities to highlight the issues faced by ALICE households, and to build solutions that promote financial stability.

KEY TERMS

ALICE: Asset Limited, Income Constrained, Employed – households with income above the Federal Poverty Level but below the basic cost of living.

Household Survival Budget: The lowest-cost options for household basics (housing, child care, food, transportation, health care, and a smartphone plan, plus taxes and a small contingency). Calculated at the county level for various household types.

ALICE Threshold of Financial Survival (the ALICE Threshold): The average income that a household needs to afford the household basics defined by the Household Survival Budget for each county.

Below ALICE Threshold: Includes both poverty-level and ALICE households – all households unable to afford the basics.

ALICE Essentials Index: A national standardized measure of the change over time in the costs of household basics included in the Household Survival Budget.

INTRODUCTION: A TALE OF TWO PANDEMICS

There are many emerging stories about the impact of the COVID-19 pandemic in the U.S. over the past 18 months. Some are stories of job loss, rising food insecurity, housing instability, and health concerns.¹ Others point to an economy in full recovery – new businesses opening at a record rate, household debt at a near low, savings rates and home prices rising, and the stock market at an all-time high.² All of these stories are true. The highs and lows of the pandemic have been experienced very differently across the U.S. population – and initial reports indicate that a key differentiator is income.³

United For ALICE, a driver of research, innovation, and action on financial hardship in the U.S., shines a light on the challenges of **ALICE: Asset Limited, Income Constrained, Employed** – households that struggle to make ends meet and have little or no savings, but often make too much to qualify for public assistance. The ALICE Threshold of Financial Survival draws a line between survival (the bare minimum needed to live and work in the modern economy) and stability; it is based on the ALICE Household Survival Budget (the lowest-cost options for housing, child care, food, transportation, health care, and a smartphone plan for all household types in each U.S. county).

Many of the economic indicators that are used to guide policy are averages of households at all income levels. These averages conceal the harsh realities millions of families faced during the pandemic. By contrast, the ALICE Threshold delineates two categories of households that experienced the pandemic in very different ways:

- **Below the ALICE Threshold:** households with income that is too low to cover the Household Survival Budget for their household type in the counties where they live. This group includes ALICE households and households with income below the Federal Poverty Level (FPL).
- **Above the ALICE Threshold:** households with income greater than the cost of the Survival Budget for their household type in the counties where they live.

Using the ALICE Threshold as its framework, this Report analyzes three nationally representative surveys about household experiences during COVID-19, as well as findings from a series of non-representative local ALICE COVID-19 Impact Surveys:

- Federal Reserve Board’s Survey of Household Economics and Decisionmaking (SHED)
- University of Southern California’s Understanding America Study’s Understanding Coronavirus in America survey (UAS COVID survey)
- U.S. Census Bureau’s COVID-19 Household Pulse Survey (Household Pulse Survey)
- United For ALICE’s COVID-19 Impact Surveys conducted with state and local partners (United For ALICE Surveys)

“ Together, the survey results show that households below the ALICE Threshold fared significantly worse than households above the Threshold – financially, physically, and emotionally – during the pandemic.”

Together, the survey results show that households below the ALICE Threshold fared significantly worse than households above the Threshold – financially, physically, and emotionally – during the pandemic. Even with the added protective measures of eviction moratoria and housing and food assistance programs, conditions worsened for households below the ALICE Threshold from March 2020 to May 2021.

Overall, the survey data included in this Report reveals that during the pandemic, experiences and realities diverged for households above and below the ALICE Threshold. Compared to households above the ALICE Threshold, those below the ALICE Threshold were more likely to have:

- **Struggled financially:**

- Reported that they were “just getting by” or “finding it difficult to get by”
- Were less likely to have reported “living comfortably”

- **Had few savings or assets:**

- Had no rainy day funds, even before the pandemic started
- Had no assets or retirement savings, or had a much lower amount
- Saw a decrease in the funds usually in their checking/savings accounts
- Were renters rather than homeowners

- **Faced disruptions in employment:**

- Lost a job, experienced a temporary layoff, or worked fewer hours
- Were not employed in full-time, salaried jobs
- Worked in hourly paid jobs, had employment gaps, or were underemployed
- Wanted to work, or if they were already working, wanted to work more hours

- **Faced barriers to work:**

- Had caregiving demands
- Faced health issues
- Had few paid sick days available

- **Faced additional concerns as parents:**

- Worked reduced hours or quit a job because their children’s classes were not completely in-person or access to child care was disrupted
- Faced food insecurity
- Had concerns about paying housing expenses, paying off debts, and facing non-COVID-19-related medical issues
- Didn’t always have a computer or other digital device available to children for educational purposes

- **Experienced more mental and physical health challenges:**
 - Had a household member with a health issue
 - Faced elevated symptoms of anxiety and depression
 - Had health issues that increased concerns about paying housing expenses, providing food, paying off debt, and losing a job
- **Needed alternative sources of income to make ends meet:**
 - Didn't have the same income sources as before the pandemic
 - Used stimulus payments and unemployment benefits to cover basic needs
 - Relied on public and private assistance
 - Borrowed from friends and family

These surveys also provide an alarming look at the breakdown of pandemic experiences by race/ethnicity. The differences here are even starker than when looking at income alone, giving credence to concerns that the pandemic is exacerbating racial inequities across all facets of life. The analysis reveals that, in particular, Black and Hispanic households have been negatively impacted by the pandemic.

The combined analysis of these surveys represents a new and fruitful frontier for understanding ALICE households. With questions on a variety of topics not previously covered by ALICE research, these surveys offer new insights into the challenges ALICE households face and the strategies they employ to get by. The surveys also provide additional validation for the ALICE Threshold as a meaningful measure, as most survey questions revealed significant differences between households above and below the Threshold.

ALICE BEFORE THE PANDEMIC

It is precisely the challenges that ALICE families were facing before the pandemic that made them so vulnerable to the health and economic crises of COVID-19. Before the pandemic, ALICE households already faced persistent challenges related to income, basic expenses, employment, and savings and credit, and for many households these issues were compounded by systemic racism and discrimination. These challenges are detailed in the national 2020 ALICE Report *On Uneven Ground: ALICE and Financial Hardship in the U.S.* and outlined below:

- ALICE never recovered from the Great Recession.
- ALICE was already struggling to afford essential household items – and the costs of these basics continue to rise.
- Employment growth over the last decade has been concentrated in low-wage jobs.
- ALICE earns too little to save, yet too much to qualify for many public and private assistance programs.
- Many households face systemic barriers to financial stability.
- Households face additional expenses not captured by the Household Survival Budget.
- ALICE households are more vulnerable in times of crisis, as they feel the economic impact almost immediately.

SURVEY DATA & METHODOLOGY

This Report presents the results from three nationally representative surveys using an ALICE lens, as well as findings from a series of local surveys conducted by United For ALICE and our partners:

- The October 2019 and November 2020 Full Surveys and July 2020 Supplementary Survey of Household Economics and Decisionmaking from the Board of Governors of the Federal Reserve (SHED) (see Appendix A)
- The ongoing biweekly Understanding America Study's Understanding Coronavirus in America ("Covid") survey conducted by the University of Southern California's Center for Economic and Social Research (UAS COVID survey) (see Appendix B)
- The ongoing weekly/biweekly COVID-19 Household Pulse Survey conducted by the U.S. Census Bureau (Household Pulse Survey) (see Appendix C)
- September 2020 to June 2021 United For ALICE COVID-19 Impact Surveys conducted in 18 locations with state and local United Ways and their community partners, with more than 45,000 respondents (United For ALICE Surveys) (see Appendix D)

There are differences between the surveys that are noted in the text and fully detailed in the appendices. Notably, the surveys varied in survey dates, sample size, and the time point used for income determination. In addition, the SHED, the UAS COVID survey, and the Household Pulse Survey are representative samples, so the weighted results are reported for population or households (according to the question). The United For ALICE Surveys are non-representative convenience samples, so results are reported for respondents only.

Survey Dates: For ongoing surveys, the weeks and/or waves chosen for analysis were based on 1) when the question being analyzed was asked (not all questions are repeated in each iteration of the ongoing surveys), and 2) if the question was asked multiple times, whether the data is presented over time or a specific week is selected based on relevance to the topic (e.g., weeks when school was in session for questions about parents' work impacts), or to match the time period for which a related question was asked in one of the other surveys.

ALICE Threshold of Financial Survival (the ALICE Threshold): With the raw data from these surveys, we were able to determine whether the survey participants were above or below the ALICE Threshold using three key criteria: 1) household income, 2) location, and 3) household composition. Location and family composition were used to identify the appropriate Household Survival Budget (based on 2018 United For ALICE data), which was then compared to the respondent's household income to determine whether they were above or below the ALICE Threshold.

Significance Testing: The differences reported between the responses of respondents above and below the ALICE Threshold were statistically significant (not attributed to chance) at a 95% confidence level. Depending on the type of question, chi-squared tests, Welch's t-tests (two-tailed), and ranked t-tests (in cases where Welch's t-tests assumptions were not met) were used.

Analysis by Race/Ethnicity: Where possible, we share data by race/ethnicity, with the following groups included in this Report:

- AIAN/Hawaiian/Pacific Islander – American Indian or Alaska Native, Native Hawaiian, or Pacific Islander
- Asian – further breakdown of this broad group was not possible due to lack of data on country of origin
- Black – reported here as non-Hispanic, though in many areas of the country there is substantial overlap between race and Hispanic ethnicity
- Hispanic – includes respondents identifying as Spanish, Hispanic, or Latinx
- White – reported here as non-Hispanic, though in many areas of the country there is substantial overlap between race and Hispanic ethnicity

The groupings and the ability to break down respondents by race/ethnicity differed across surveys. See the appendices and the notes shown below figures for more details.

To access the data used in this Report, download the Report Crosstabs at UnitedForALICE.org/National-Reports

THE FINANCIAL IMPACT OF COVID-19

For many households, overall household finances were constricted during the pandemic, and it became more difficult to meet basic needs. There were a variety of reasons for this: reduced income or other employment impacts, school closures, gaps in access to health care, new or worsening health problems, decreased social support during quarantine, and other issues.⁴ While all households were undoubtedly affected in some way, it is not surprising that those who were already struggling to make ends meet before the pandemic fared worse.

The serious financial impact of the pandemic has been concealed by summary statistics. For example, according to the Federal Reserve SHED, there was a slight increase in the percentage of households struggling to get by financially at the beginning of the pandemic (from 25% in October 2019 to 27% in April 2020), but rates improved, falling to below pre-pandemic levels by July 2020 (23%).⁵ Similarly, the percentage of households reporting that they were “living comfortably” decreased slightly at the beginning of the pandemic (from 36% in October 2019 to 29% in April 2020) but improved by July 2020 (ending at 37%).

But behind the averages of all respondents, two very different trajectories emerged for people with household income above and below the ALICE Threshold. In July 2020, when total responses suggested full recovery, the reality was quite different: When asked in the SHED how they were managing financially overall, 42% of respondents below the ALICE Threshold were struggling, compared to less than 10% of those above the Threshold (29% vs. 7% were “just getting by” and 13% vs. 2% were “finding it difficult to get by”). Conversely, respondents above the ALICE Threshold were significantly more likely than those below the Threshold to say that they were “living comfortably” (51% vs. 17%) (Figure 1).

Figure 1.
Managing Financially by the ALICE Threshold

Question: Overall, which of the following best describes how you are managing financially these days?

Source: ALICE Threshold, 2018; Federal Reserve Board, Survey of Household Economics and Decisionmaking (SHED), July 2020

The gap between those struggling financially during the pandemic and those living comfortably was even wider by race/ethnicity. According to the July 2020 SHED, Black and Hispanic respondents below the ALICE Threshold were significantly more likely to report that they were “finding it difficult to get by” (16% and 15%, respectively) compared to White respondents (11%) and especially to respondents of all race/ethnicities above the ALICE Threshold (less than 3%). On the other end of the spectrum, above the ALICE Threshold, White respondents were significantly more likely to report that they were “living comfortably” (56%) compared to Black and Hispanic respondents (33% and 37%) (Figure 2).

Figure 2.
Managing Financially by the ALICE Threshold and Race/Ethnicity

Question: Overall, which of the following best describes how you are managing financially these days?

Note: Groupings include Black non-Hispanic, Hispanic, and White non-Hispanic respondents.

Source: ALICE Threshold, 2018; Federal Reserve Board, Survey of Household Economics and Decisionmaking (SHED), July 2020

Ability to Afford Basic Expenses: The subjective experiences of how households are managing financially during the pandemic were reflected in their ability to cover the cost of household basics:

- Respondents below the ALICE Threshold were almost three times more likely to report difficulty paying for household expenses. Over half (52%) of respondents below the ALICE Threshold said that it was “somewhat difficult” or “very difficult” to pay for usual household expenses (including but not limited to food, rent or mortgage, car payments, medical expenses, and student loans), a significantly higher percentage than respondents above the ALICE Threshold, at 19% (Household Pulse Survey, August 19–August 31, 2020).
- The majority of households below the ALICE Threshold had difficulty meeting at least one basic need in the Household Survival Budget. Only 23% reported that their household had no trouble meeting basic needs, compared to more than two-thirds (69%) of those above the Threshold who reported no trouble meeting basic needs (United For ALICE Surveys, February–June 2021).
- By race, Black respondents were significantly more likely to report that it was “somewhat difficult” or “very difficult” to pay for usual household expenses (47%), compared to White or Asian respondents (29% and 31%, respectively), and the difference was even greater when considering ALICE Threshold status. Sixty-one percent of Black respondents below the ALICE Threshold had difficulty paying usual household expenses, a significantly higher percentage than White or Asian respondents (Household Pulse Survey, August 19–August 31, 2020)
- Only 39% of respondents below the ALICE Threshold said in July 2020 that they were very confident they would be able to pay all their bills in full in August, compared to 73% of respondents above the ALICE Threshold (SHED, July 2020) (Figure 3).

Figure 3.
Ability to Pay Bills in Full by the ALICE Threshold

Question: How confident are you that you will be able to pay all of your bills in full in August?

Source: ALICE Threshold, 2018; Federal Reserve Board, Survey of Household Economics and Decisionmaking (SHED), July 2020

Breaking down expenses further exposes the depth and breadth of the financial challenges households faced during the pandemic and provides context for the differences in pandemic impacts between households above and below the ALICE Threshold, as discussed in subsequent sections.

Ability to Afford Housing: Because housing provides underlying stability for all other facets of daily life, difficulties paying housing expenses were a substantial concern for many during the pandemic:

- Among UAS COVID survey respondents below the ALICE Threshold, 17% reported in August 2020 that they thought there was more than a 25% chance that they would be evicted, go into foreclosure, or be forced by a landlord to move in the next 30 days, compared to only 4% of those above the Threshold.
- Among renters, households below the ALICE Threshold were significantly more likely to have asked their landlords for permission to delay or reduce payment of rent than those above the Threshold (18% vs. 13%) (UAS COVID survey, May 2020).
- Among renter households below the ALICE Threshold, those headed by someone of color were more likely to report being behind on rent (29% of Black respondents, 23% of Asian respondents, and 22% of Hispanic respondents, compared to 17% of White respondents) (Household Pulse Survey, August 19–31, 2020).
- These differences between groups also played out over time: From August 2020 to May 2021, renter households below the ALICE Threshold were significantly more likely to report that they were not caught up on rent payments than those above the ALICE Threshold (fluctuating between 19% and 28% of renters below the ALICE Threshold vs. between 7% and 11% of renters above the Threshold) (Household Pulse Survey, August 19–August 31, 2020 and May 12–24, 2021).

Given these difficulties, it is not surprising that meeting housing needs was the concern most often selected by respondents below the ALICE Threshold in the United For ALICE Surveys (conducted February to June 2021): 68% of respondents below the ALICE Threshold said that they were concerned about paying for housing expenses during the pandemic and 36% said it was their biggest concern. In contrast, the concern most often selected by respondents above the ALICE Threshold was contracting COVID-19 (78%) — only 21% said that paying housing expenses was a concern, and even fewer (9%) said that it was their biggest concern.

Respondents below the ALICE Threshold were significantly more likely than those above the Threshold to say that they had difficulty meeting housing needs during the pandemic (51% vs. 12%). Additionally, the percentage of households struggling to meet their housing expenses was significantly higher among Black (60%) and Hispanic (57%) households below the ALICE Threshold, compared to 37% of White households below the Threshold (Figure 4).

Figure 4.
Difficulty Meeting Housing Needs by the ALICE Threshold and Race/Ethnicity

Question: Since March 1, 2020, has your household had trouble meeting any of the following needs? ["Difficulty meeting housing needs" selected]

Note: All racial groups include respondents who selected that race alone. The Hispanic ethnic group includes respondents who selected "Spanish, Hispanic, or Latinx" alone or in combination with one or more racial groups.

Source: ALICE Threshold, 2018; United For ALICE COVID Impact Surveys, September 2020–June 2021

Ability to Afford Non-Housing Expenses: Housing was not the only budget category that posed a challenge to struggling households during the pandemic. Respondents below the ALICE Threshold were significantly more likely than those above the Threshold to say that they had difficulty meeting non-housing expenses, including food needs (39% vs. 8%), health care needs (22% vs. 12%), technology needs (16% vs. 8%), and transportation needs (15% vs. 3%). (See the "Challenges for Families With Children" section for more details on child care needs.)

SAVINGS AND ASSETS

A defining feature of ALICE households is in the phrase “asset limited.” As the previous section highlights, ALICE families struggle to meet their households’ immediate, basic needs, which makes saving for an emergency — let alone for the future — a difficult task. As a result, ALICE families can neither build assets nor catch up to those who already have assets (especially those who have been building them for generations). But until now, there has not been definitive data on savings and assets specifically for households below the ALICE Threshold. Analysis of the SHED helps fill this gap.

Savings for a Rainy Day: It has been widely reported that savings increased during the pandemic.⁶ One indicator of this was in the SHED’s question about whether respondents had set aside emergency or “rainy day funds” that would cover their expenses for three months in case of sickness, job loss, economic downturn, or other emergencies. In October 2019, just over half of all respondents (53%) reported having these funds; by November 2020, that share had increased to 55% (Figure 5).

Yet this average conceals a huge gulf between those above and below the ALICE Threshold. Only one-third of respondents below the ALICE Threshold reported having rainy day funds, with the percentage dropping from 33% in October 2019 to 32% by November 2020. In contrast, more than two-thirds of those above the Threshold had rainy day funds, and that share increased from 68% to 71% during the pandemic.

The gap by race/ethnicity was even greater, with White respondents significantly more likely to report that they had savings for an emergency than Black and Hispanic respondents — both above and below the ALICE Threshold (Figure 5). From October 2019 to November 2020, the percentage of respondents below the ALICE Threshold with savings decreased for Hispanic respondents (from 28% to 27%) and Black respondents (from 27% to 25%) while remaining flat at 36% for White respondents. In contrast, the percentage of respondents with savings increased for all groups above the ALICE Threshold, narrowing the racial/ethnic gap slightly: 73% for White respondents (up from 70% in October 2019) vs. 65% for Hispanic respondents (up from 57%) and 62% for Black respondents (up from 55%) (SHED, October 2019; SHED, November 2020).

“ Because of the loss of work of two of the three people in my household... we cannot pay our bills, car loans, etc. Our three credit cards have been cancelled due to nonpayment, damaging our credit score. There are things happening that I never thought could so quickly destroy your life. ”

— United For ALICE Survey respondent, Tennessee

Figure 5.

Rainy Day Funds to Cover Three Months' Expenses by the ALICE Threshold and Race/Ethnicity

Question: Have you set aside emergency or rainy day funds that would cover your expenses for 3 months in the case of sickness, job loss, economic downturn, or other emergencies?

Note: Groupings include Black, non-Hispanic, Hispanic, and White non-Hispanic respondents.

Source: ALICE Threshold, 2018; Federal Reserve Board, Survey of Household Economics and Decisionmaking (SHED), November 2020

Covering New and/or Unexpected Expenses: Not having a financial cushion makes ALICE households more vulnerable to the effects of disasters from floods, hurricanes, and wildfires to pandemics, and crises ranging from illness to car accidents. ALICE families feel the economic impact almost immediately – if they can't work, they lose pay, and if they get sick, there are unbudgeted medical bills to pay.

The overall picture of the pandemic reported in the 2020 SHED, however, was one of financial stability. On average, most households found that their monthly income increased or stayed the same and their monthly spending decreased or stayed the same; as a result, their checking account balance increased or stayed the same compared to one year prior (pre-pandemic, November 2019).

Breaking down the responses by income levels, however, reveals a different experience for those below the ALICE Threshold than for those above it:

- **Monthly income decreased** for 26% of households below the ALICE Threshold vs. 14% above the Threshold
- **Monthly spending increased** for 24% of households below the ALICE Threshold vs. 16% above the Threshold
- **The amount of money usually in checking/savings accounts (after paying monthly bills) decreased** for 33% of households below the ALICE Threshold vs. 15% above the Threshold

The November 2020 SHED provides insight into how households cover unexpected expenses. Respondents were asked, "If you had an unexpected emergency expense that costs \$400, how would you pay for this expense?" (Figure 6). Responses differed for households above and below the ALICE Threshold:

- Respondents above the ALICE Threshold were significantly more likely than those below to say that they would pay the expense with the money currently in their checking/savings account or with cash (51% vs. 36%) or put it on their credit card and pay it off in full at the next statement (48% vs. 19%).

- Respondents below the ALICE Threshold were significantly more likely than those above to say that they would put the expense on credit and pay over time (18% vs. 13%), borrow from friends or family (17% vs. 3%), sell something (11% vs. 3%), use a bank loan or line of credit (3% vs. 2%), or use a payday loan, deposit advance, or overdraft (2% vs. 1%).
- Among respondents below the ALICE Threshold, 25% said that they wouldn't be able to pay for the expense right now, while only 3% of those above the Threshold said that they wouldn't be able to pay.

Figure 6.

How Respondents Would Cover a \$400 Emergency Expense by the ALICE Threshold

Question: Suppose that you have an emergency expense that costs \$400. Based on your current financial situation, how would you pay for this expense?

Note: Respondents could select all that apply

Source: ALICE Threshold, 2018; Federal Reserve Board, Survey of Household Economics and Decisionmaking (SHED), November 2020

Responses also differed by race/ethnicity. Among respondents below the ALICE Threshold:

- White respondents were significantly more likely to say that they would pay the expense with the money currently in their checking/savings account or with cash than Black or Hispanic respondents (39% vs. 32% and 34%, respectively) or put it on their credit card and pay it off in full at the next statement (23% vs. 11% or 14%, respectively).
- Hispanic respondents were significantly more likely to say that they would put the expense on credit and pay over time than White or Black respondents (22% vs. 17% each), borrow from friends or family (23% vs. 15% and 17% respectively), or sell something (17% vs. 8% and 12%, respectively).
- Black respondents were significantly more likely to say that they wouldn't be able to pay for the expense right now (37%) compared to 27% of Hispanic respondents and 22% of White respondents.

Bank Accounts: The way that households save (or don't) varied across households above and below the ALICE Threshold and by race/ethnicity. According to the October 2019 SHED, across all households, most had a checking, savings, or money market account (94%); however, those above the ALICE Threshold were significantly more likely to have one (99% versus 90%). The percentage of households with a bank account (savings or checking) varied further by race/ethnicity:

- **Gaps between racial/ethnic groups:** Almost all White households (97%) had a bank account, compared to 87% of Black households.
- **Gaps within races/ethnicities:** For White households, 100% above the ALICE Threshold had a bank account vs. 94% below the Threshold. For Hispanic households, the rates were 99% for those above the Threshold vs. 87% for those below, and for Black households, 99% for those above the Threshold vs. 82% for those below.

Retirement Savings: A lack of savings also limits future possibilities. Sending a child to college, putting a down payment on a house, or building a nest egg for retirement become unattainable dreams. The 2020 SHED provides more concrete data on retirement savings, yet the gap by income status is concealed by the totals. For example, of the total population, 20% of respondents reported having less than \$10,000 in savings for retirement in November 2020. However, most respondents below the ALICE Threshold (43%) had less than \$10,000 in savings and only 12% had more than \$100,000. At the other end of the spectrum, nearly one-third (30%) of those above the ALICE Threshold had \$100,000 to \$500,000, and almost another quarter (23%) had more than \$500,000 saved (Figure 7).

Figure 7.
Amount Saved for Retirement by the ALICE Threshold

Question: Approximately how much money do you currently have saved for retirement?

Note: Respondents who selected "Don't Know" are not shown.

Source: ALICE Threshold, 2018; Federal Reserve Board, Survey of Household Economics and Decisionmaking (SHED), November 2020

The gaps in retirement savings were even greater by race/ethnicity. Among those below the ALICE Threshold, Black and Hispanic respondents were significantly more likely to report having less than \$10,000 in savings compared to White respondents (46% each vs. 42%). And at the other end of the spectrum, White respondents above the ALICE Threshold were significantly more likely to have savings of \$100,000 or more compared to Hispanic or Black respondents above the Threshold (57% vs. 44% and 32%, respectively) (Figure 8).

Figure 8.
Amount Saved for Retirement by the ALICE Threshold and Race/Ethnicity

Question: Approximately how much money do you currently have saved for retirement?

Note: Groupings include Black, non-Hispanic, Hispanic, and White non-Hispanic respondents. Respondents who selected "Don't Know" are not shown.

Source: ALICE Threshold, 2018; Federal Reserve Board, Survey of Household Economics and Decisionmaking (SHED), November 2020

Investments: Given these differences in the amount of retirement savings between households above and below the ALICE Threshold and by race/ethnicity, it is not surprising that gaps exist in whether households have and use related financial tools – assets such as 401(k)s, IRAs, or other investments that produce income (like stocks or rental properties).

According to the November 2020 SHED, respondents above the ALICE Threshold were significantly more likely to have the following retirement assets compared to those below the Threshold:

- **401(k): 74% vs. 29%**
- **IRA: 48% vs. 14%**
- **Pension: 31% vs. 9%**
- **Business or real estate that will provide income in retirement: 14% vs. 3%**
- **Additional retirement savings: 68% vs. 28%⁷**

United For ALICE Surveys show substantial racial/ethnic disparities in investment asset ownership. Overall, almost half of respondents reported having a 401(k), IRA, or other investment, concealing huge gulfs between those above and below the ALICE Threshold and by race/ethnicity. White respondents were significantly more likely to have investments than Asian, Hispanic, or Black respondents; and for each race/ethnicity, those above the ALICE Threshold were at least three times as likely to have investments as those below (Figure 9).

Figure 9.
Investments by the ALICE Threshold and Race/Ethnicity

Question: Which of the following assets does your household have? ["Have a 401(k), IRA, or other investment" selected]

Note: All racial groups include respondents who selected that race alone. The Hispanic ethnic group includes respondents who selected "Spanish, Hispanic, or Latinx" alone or in combination with one or more racial groups.

Source: ALICE Threshold, 2018; United For ALICE COVID Impact Surveys, September 2020–June 2021

Vehicles: ALICE households depend on reliable transportation to reach jobs, schools and child care, health care, stores, and more. Yet vehicles are not an effective means of accumulating wealth because the value of a car normally decreases over time. Results from the United For ALICE Surveys suggest substantial disparities in vehicle ownership between households above and below the ALICE Threshold and by race/ethnicity.

Almost all respondents above the ALICE Threshold, of all races and ethnicities, reported that their household owns a vehicle (91%). Vehicle ownership was less universal for respondents below the ALICE Threshold (75%), with substantial gaps by race/ethnicity: White (81%), Asian (67%), Hispanic (68%), and Black (63%). There were also gaps in ownership with or without an auto loan within every race/ethnicity.

Homeownership: The next most common asset is a home – perhaps the most important asset in providing financial stability and a means for low-income families to accumulate wealth. Homeownership can increase both financial and social stability for families. But with less income to save for a down payment, build credit, and qualify for a mortgage, it's not surprising that households below the ALICE Threshold had significantly lower homeownership rates than those above (41% vs 82%) (United For ALICE Surveys).

The results of the United For ALICE Surveys also revealed stark differences in homeownership by race/ethnicity at all income levels for those both with and without a mortgage (Figure 10):

- Homeownership for Black and Hispanic respondents' households was significantly lower than for other groups:
 - Below ALICE Threshold: 24% of Black and 35% of Hispanic households vs. 48% of White and 58% of Asian households
 - Above ALICE Threshold: 65% of Black and 73% of Hispanic vs. 77% of Asian and 85% of White households
- Black and Hispanic respondents' households were significantly less likely to own their homes without a mortgage:
 - Below ALICE Threshold: 5% of Black and 7% of Hispanic households vs. 14% of White and 16% of Asian households
 - Above ALICE Threshold: 10% of Hispanic and 12% of Black households vs. 16% of Asian and 21% of White households

Figure 10.
Homeownership by the ALICE Threshold and Race/Ethnicity

Question: Which of the following assets does your household have? ["Own your home with a mortgage" or "own your home with NO mortgage" selected]

Note: All racial groups include respondents who selected that race alone. The Hispanic ethnic group includes respondents who selected "Spanish, Hispanic, or Latinx" alone or in combination with one or more racial groups.

Source: ALICE Threshold, 2018; United For ALICE COVID Impact Surveys, September 2020–June 2021

EMPLOYMENT CHANGES AND CHALLENGES

With shutdowns, business restrictions, and mask mandates in place to curb the spread of COVID-19, many workers and businesses struggled throughout the pandemic. Along with case counts and deaths, the unemployment rate has been one of the most closely watched metrics of the pandemic as a barometer for the state of the economy. In April 2020, the unemployment rate reached 14.8% — the highest rate observed since this measure was established in 1948.⁸ By February 2021, almost half (48%) of respondents to the Household Pulse Survey reported that someone in their household had experienced a loss of employment income during the pandemic. Yet even these alarming statistics capture only part of the enormous shift in employment experienced during the pandemic, and in so doing, they conceal the disproportionate hardship experienced by most families with income below the ALICE Threshold.

In addition to greater job loss, workers with income below the ALICE Threshold were more likely to have trouble finding a new job. For those who were able to continue working, they were more likely to have their hours and wages reduced or to be required to work on-site, and less likely to receive paid sick days.

Job Loss and Unemployment: By the beginning of 2021, 60% of households with income below the ALICE Threshold had experienced a loss of employment income, compared to 40% of households above the Threshold (Household Pulse Survey, January 20–February 1, 2021).

As the pandemic unfolded, employment and labor-force status fluctuated, with trends differing by household income (Figure 11). According to the UAS COVID survey, while workers of all incomes faced a steep decline in work from March to April 2020, respondents with household income below the ALICE Threshold were both less likely to have had a job before the pandemic and less likely to return to work as the economy rebounded in late 2020. Respondents from households below the ALICE Threshold also:

- **Faced a bumpy ride:** Pre-pandemic, 56% of respondents reported that they were working. That rate dropped to 37% in April 2020, before rebounding slightly to 42% by May 2021.
- **Were more likely to be looking for work:** 28% of respondents reported that they were looking for work in May 2020, a rate that steadily declined to 14% by April 2021.
- **Were more likely to report being out of the labor force:** This rate rose from 10% in April 2020 to 14% in April 2021.
- **Were more likely to report being retired:** Retirement increased from 18% in April 2020 to 25% in April 2021.

In contrast, respondents with household income above the ALICE Threshold were more likely to have had a job before the pandemic and to return to work more quickly. These respondents:

- **Had more job stability:** More than three in four respondents above the ALICE Threshold were working in March 2020. That percentage fell to 61% in April 2020 and then rebounded by September 2020 to 67%, where it remained through May 2021.
- **Were less likely to be looking for work:** The share of respondents looking for work was 2% in April 2020. It rose to 9% in May 2020 but fell quickly to below 6% and remained there through May 2021.
- **Were less likely to report being out of the labor force:** This rate remained flat at less than 5% throughout this period.
- **Were less likely to report being retired:** Retirement remained flat at approximately 20% throughout this period.

Figure 11.

Labor Status Over Time by the ALICE Threshold, March 20, 2020–April 24, 2021

Question: Labor Status ["Currently working" or "Unemployed, looking" selected]

Source: ALICE Threshold, 2018; University of Southern California, Understanding America Study's Understanding Coronavirus in America Survey, March 20, 2020–April 24, 2021

Results from the United For ALICE Surveys also highlight similar and substantial differences in employment among household members based on ALICE Threshold status. **Households below the ALICE Threshold were significantly more likely to experience a disruption in their employment.** Only 31% of respondents below the ALICE Threshold reported no employment change, while households above the Threshold had twice as much employment stability, with almost 60% reporting no change (Figure 12). In addition, respondents below the ALICE Threshold were significantly more likely to report that they or a household member:

- **Lost a job:** 35% of respondents below the ALICE Threshold said that someone in their household lost a job (vs. 14% of respondents above the Threshold).
- **Experienced a temporary layoff:** 22% of respondents below the ALICE Threshold reported that someone in their household was temporarily laid off (vs. 12% of respondents above the Threshold).
- **Started a new job:** 11% of respondents below the ALICE Threshold reported that someone in their household started a new or additional job (vs. 9% of respondents above the Threshold).
- **Changed jobs:** 16% of respondents below the ALICE Threshold reported that someone in their household changed jobs (vs. 10% of respondents above the Threshold).

Figure 12.
Changes in Employment Status by the ALICE Threshold

Note: Respondents could select all that apply and were asked to report employment impacts for themselves or for other household members.

Source: ALICE Threshold, 2018; United For ALICE COVID Impact Surveys, September 2020 - June 2021

There were also significant gaps in employment stability by race/ethnicity. White and Asian respondents were less likely to report that someone in their household had a change in employment status during the pandemic:

- **No change in employment:** Approximately half of White and Asian respondents reported that no one in their household had a change in employment (49% and 45%, respectively), compared to approximately one-third of Black (37%), Hispanic (34%), and AIAN/Hawaiian/Pacific Islander (34%) respondents.
- **Job loss:** Less than one-quarter of Asian and White respondents reported that no one in their household lost a job during the pandemic (24% and 21%, respectively), compared to approximately one-third of Hispanic (35%), AIAN/Hawaiian/Pacific Islander (34%), and Black (32%) respondents.

“ This pandemic has completely impacted my family. One [household member] completely lost a job, no unemployment [insurance], and can't find another job. One is working less hours and cannot afford anything. I go hungry so my kids can eat. Food stamps got taken away because of what I make... ”

– United For ALICE Survey respondent, Shenandoah Valley, Virginia

The largest gaps in employment change during the pandemic, however, emerge when looking at employment differences by race/ethnicity and income together. Across all five racial/ethnic groups in Figures 13 and 14, the most significant differences were found when comparing households above and below the ALICE Threshold. There were also gaps by race and ethnicity both above and below the Threshold. For example, Hispanic, AIAN/Hawaiian/Pacific Islander, and Black respondents were significantly less likely to report no change to their employment than White and Asian respondents, and though there was less change overall for respondents above the ALICE Threshold, the gaps by race/ethnicity persisted (Figure 13).

Figure 13.
No Changes in Employment Status by the ALICE Threshold and Race/Ethnicity

Question: Since March 1, 2020, has employment changed for any household members? ["Employment hasn't changed for any household members" selected]

Note: Respondents could select all that apply (except "employment hasn't changed," which was exclusive) and were asked to report employment impacts for themselves or for other household members. All racial groups include respondents who selected that race alone, except for "AIAN/H/PI," which includes respondents who selected "American Indian or Alaska Native" or "Native Hawaiian or Pacific Islander" alone or in combination with other races (non-Hispanic). The Hispanic ethnic group includes respondents who selected "Spanish, Hispanic, or Latinx" alone or in combination with one or more racial groups.

Source: ALICE Threshold, 2018; United For ALICE COVID Impact Surveys, September 2020–June 2021

Similarly, Hispanic, AIAN/Hawaiian/Pacific Islander, and Black respondents below the ALICE Threshold were significantly more likely to report that one or more household members lost a job than White and Asian respondents, and though there was less job loss overall among respondents above the ALICE Threshold, those disparities persisted (Figure 14).

Figure 14.
Job Loss by Race/Ethnicity and ALICE Threshold Status

Question: Since March 1, 2020, has employment changed for any household members? ["One or more household members lost a job" selected]

Note: Respondents could select all that apply and were asked to report employment impacts for themselves or for other household members. All racial groups include respondents who selected that race alone, except for "AIAN/H/PI," which includes respondents who selected "American Indian or Alaska Native" or "Native Hawaiian or Pacific Islander" alone or in combination with other races (non-Hispanic). The Hispanic ethnic group includes respondents who selected "Spanish, Hispanic, or Latinx" alone or in combination with one or more racial groups.

Source: ALICE Threshold, 2018; United For ALICE COVID Impact Surveys, September 2020–June 2021

“ My household member would still have a business (co-owned a tour bus company) if everything wasn’t shut down due to this pandemic. He had to shut it down, liquidate everything, and lost a lot of money. He still has buses he is making payments on and no business. ”

– United For ALICE Survey respondent, Arkansas

Employment and opportunities to work were at the heart of the differences by income as well as by race/ethnicity. Responses from the SHED reveal that across all races/ethnicities, households below the ALICE Threshold were significantly less likely to report that they did any work for pay or profit in the previous month than those above the Threshold. The follow-up question reveals a significant difference by race/ethnicity: Black and Hispanic respondents below the ALICE Threshold were significantly more likely to say that they wanted to work, or if they were already working, wanted to work more hours (54% and 59%, respectively), compared with White respondents (44%) (Figure 15).

Figure 15.
Current Work and Desire to Work More by the ALICE Threshold and Race/Ethnicity

Questions: Last month, did you do any work for either pay or profit? And: At any time during the past month, did you want to work/work more hours?

Note: Groupings include Black non-Hispanic, Hispanic, and White non-Hispanic respondents.

Source: ALICE Threshold, 2018; Federal Reserve Board, Survey of Household Economics and Decisionmaking (SHED), October 2019

Barriers to work: For more insight into the situations of people looking for work, the United For ALICE Surveys asked jobseekers about the barriers they had been facing during the pandemic. For respondents both above and below the ALICE Threshold, “trouble finding a job” was the most reported barrier (53% of all respondents), and both groups reported difficulties finding a job that pays enough (46% of all respondents). Beyond the top two barriers, however, there were differences between households above and below the ALICE Threshold. Jobseekers below the ALICE Threshold were significantly more likely than jobseekers above the Threshold to report that the following five factors were barriers to securing employment:

- Caregiving for a child, older adult, or person with special needs (48% vs. 20%)
- Concerns about contracting COVID-19 (38% vs. 30%)
- Existing health issues (19% vs. 14%)
- Transportation issues (17% vs. 6%)
- Internet/computer issues (9% vs. 5%)

Similarly, the Household Pulse Survey found that among non-retired respondents who had not worked in the previous seven days (surveyed between January 20 and February 1, 2021, when case counts were increasing rapidly across the country), health issues were a major reason why respondents reported not working. Of these respondents, 20% with household incomes below the ALICE Threshold and 13% above the Threshold said that they were not working because they were sick or disabled (8% and 6%, respectively, reported that they were sick with COVID-19).

Lack of Paid Sick Days: The UAS COVID survey sheds light on why these differences in employment status might exist, especially during a public health crisis. Workers with household income below the ALICE Threshold were significantly less likely to report that they had any paid sick days (45% said that they had no paid sick time), while workers with household income above the Threshold were significantly more likely to report having more than 14 sick days (41%) (Figure 16). See the “Mental and Physical Health” section of this Report for more detailed information on this topic.

Figure 16.
Allowable Sick Days by the ALICE Threshold

Question: If you get sick, how many days can you stay home from your job and still get paid?

Source: ALICE Threshold, 2018; University of Southern California, Understanding America Study's Understanding Coronavirus in America Survey, Wave 24 Fielded February 2, 2021–March 3, 2021

The lack of paid sick days is an especially critical issue for workers with household income below the ALICE Threshold, as they were less likely to report being able to work from home. Throughout the pandemic, less than 15% of workers below the ALICE Threshold reported that their employer instructed them to work from home. For workers above the ALICE Threshold, the rate declined over time, falling from 55% in April 2020 to 30% in May 2021, but it was always significantly higher than the rate for workers below the Threshold (UAS COVID survey).

Hourly vs. Salaried Work: ALICE workers are more likely to work in hourly paid jobs than in salaried jobs. According to the United For ALICE COVID Surveys, among those working during the pandemic, employment impacts differed for workers in hourly paid jobs compared to salaried positions (Figure 17), which may also help explain differences in benefits, like paid sick days, and in caregiving issues. Respondents with household income below the ALICE Threshold were significantly more likely than those above the Threshold to rely on income from hourly paid work (70% vs. 45%), and significantly less likely to have household members who work for a salary (25% vs. 69%).

This dichotomy led to differences in the ability to work remotely: Only 17% of those below the ALICE Threshold were able to shift to remote work when the pandemic started, compared to over half (51%) of salaried workers. That, in turn, led to significant differences in the need to purchase protective gear and new technology (Figure 17).

Figure 17.
Pandemic Employment Impacts, Hourly vs. Salary Work

Questions: For adults in your household who work for a salary, which of the following have occurred as a result of the COVID-19 pandemic? And For adults in your household who work in jobs that are paid by the hour, which of the following have occurred as a result of the COVID-19 pandemic?

Note: Respondents could select all that apply and were asked to report employment impacts for themselves and other household members.

Source: United For ALICE COVID Impact Surveys, September 2020–June 2021

Hourly vs. Salaried Work Above and Below the ALICE Threshold: Within these two employment groups (hourly vs. salary), there were significant differences by income. Notably, among households with hourly paid workers, **respondents below the ALICE Threshold were significantly more likely to be working fewer hours than before the pandemic (34% vs. 24%)** and significantly less likely to be working remotely (11% vs. 20%). Among households with salaried workers, respondents below the ALICE Threshold were significantly less likely to be working remotely (28% vs. 50%).

Households with hourly paid workers who worked fewer hours overwhelmingly reported that it was because their employer had less business or needed fewer workers (73% below the ALICE Threshold and 79% above the Threshold). Respondents below the ALICE Threshold also faced additional challenges: They were significantly more likely to say that they were working fewer hours due to caregiving needs (28% vs. 14%), fear of catching or spreading COVID-19 (23% vs. 14%), health issues (11% vs. 5%), and limited computer or internet access (2% vs. 1%).

CHALLENGES FOR FAMILIES WITH CHILDREN

Families with children were among the hardest hit by the pandemic. With the closure of child care centers and schools, there was significant disruption to learning, working, and family activity. Children have had to adjust to new child care and education structures and settings, parents have had to juggle work (remote and in-person), and child care providers have had to adapt to smaller groups and new protocols. The November 2020 SHED revealed that three out of five parents (60%) reported that their access to child care had been disrupted since the onset of the pandemic.

Impacts on Parent Work: Results from the UAS COVID survey confirm that the pandemic created challenges for parents with school-aged children at all income levels. At the beginning of the pandemic, almost 40% of parents reported that school closures made it difficult to both work and do other household tasks. Additionally, 40% said that they were not satisfied with how much their children were learning (in April and May 2020).

By November 2020, households below the ALICE Threshold with children faced more employment challenges than those above the Threshold because their children's classes were not completely in-person, or because access to child care was disrupted. These households were more likely than those above the ALICE Threshold to report that these child care issues led to their working less (23% vs. 16%) or not working (21% vs. 6%) (SHED, November 2020).

The United For ALICE Surveys found similar gaps (Figure 18). Respondents above the ALICE Threshold with children were significantly less likely to report that child care issues had an impact on employment than respondents below the Threshold (57% vs. 46%). Respondents below the ALICE Threshold were significantly more likely to say that they were working reduced hours (24% vs. 16%) or that they had to quit a job (17% vs. 3%) due to child care issues.

Figure 18.
Child Care Impacts on Household Employment by the ALICE Threshold

Question: Since March 1, 2020, how have child care issues impacted household members' ability to work?

Note: Respondents could select all that apply and were asked to report employment impacts for themselves or for other household members.

Source: ALICE Threshold, 2018; United For ALICE COVID Impact Surveys, September 2020–June 2021

Food Insecurity: Families with children also faced unique challenges in meeting basic needs, most notably with the most fundamental need — food. Access to and affordability of food was a challenge for many throughout the pandemic, especially for households below the ALICE Threshold with children, and reported across all surveys:

- Among respondents below the ALICE Threshold with children, 41% reported that “sometimes” or “often” their children were not eating enough because the household couldn’t afford enough food. While this was less common in higher-income households, a substantial 17% of respondents above the ALICE Threshold also struggled to afford food for their children (Household Pulse Survey, January 20– February 1, 2021).
- Among respondents below the ALICE Threshold with children, 56% reported that they were concerned about having enough food for the household compared to 15% of respondents above the Threshold (United For ALICE Surveys).
- Black and Hispanic respondents below the ALICE threshold were more likely to report difficulty affording food for their children during the pandemic (49% of both Black and Hispanic respondents, compared to 35% of White respondents) (Household Pulse Survey, January 20– February 1, 2021).
- Results from the UAS COVID survey confirm that among families with children, households below the ALICE Threshold were significantly more likely to report facing food insecurity due to lack of meals provided at school (21% vs. 7%).

“ I am a single mom of three kids. I work a full-time, 12-hour night shift job at a long-term nursing home. It's a struggle to sleep for work, help with school work, and maintain a normal life for my kids. ”

– United For ALICE Survey respondent, Shenandoah Valley, Virginia

Other Concerns for Families With Children: Beyond food needs, United For ALICE Survey respondents below the ALICE Threshold with children were also significantly more likely than respondents above the Threshold to say that they were concerned about:

- Paying housing expenses (71% vs. 22%)
- Paying off debts (50% vs. 27%)
- A reduction in hours/wages for household members who were working (42% vs. 23%)
- Loss of jobs (41% vs. 20%)
- Non-COVID-19-related medical issues (28% vs. 21%)

Technology for Families With Children: As internet and device access became increasingly important for work and learning during the pandemic, households below the ALICE Threshold with children reported concerns about access to technology.

- For families with children in school, those below the ALICE Threshold were less likely to always have a computer or other digital device available for educational purposes. At the beginning of the pandemic (Spring 2020), the percentage of respondents below the ALICE Threshold who said they “usually or always” had technology available for educational purposes hovered around 80%; by the following school year, that percentage rose to 90%. For those above the ALICE Threshold, the percentage was 96% throughout (Household Pulse Survey, April 23, 2020–March 29, 2021, excluding June and August 2020).
- Respondents below the ALICE Threshold with children were significantly more likely to have concerns about internet and device access (20% vs. 18%) (United For ALICE Surveys) (Figure 19).

Child Care and Learning Issues: The pandemic brought about substantial changes in child care and education, which created new challenges for families with children (Figure 19):

- Respondents below the ALICE Threshold with children were significantly more likely to be concerned about health risks for children/household members (36% vs. 33%), the cost of child care/education (28% vs. 15%), finding a provider with consistent/sufficient hours (19% vs. 16%) and that care would not be available when needed (16% vs. 14%).
- While helping with distanced learning and juggling work and child needs were the top concerns for both groups, respondents above the ALICE Threshold with children were significantly more likely to have these concerns (53% vs. 39% for juggling work and child needs and 49% vs. 40% for helping with distanced learning).

Figure 19.
Household Child Care and Education Issues or Concerns by the ALICE Threshold

Question: Since March 1, 2020, as a result of the COVID-19 pandemic, what child care issues or concerns or issues have members of your household had?

Note: Respondents could select all that apply.

Source: ALICE Threshold, 2018; United For ALICE COVID Impact Surveys, September 2020–June 2021

“ Our biggest concern is the limited number of child care facilities in our rural area and that has prevented my husband from being able to return to work. The few childcare facilities in our area have been struggling with COVID-19 outbreaks, where they have had sporadic available hours. I am an essential worker for the state, working remotely, and carry the health insurance for our family, therefore I have been the one that has remained employed. ”

– United For ALICE Survey respondent, Indiana

PHYSICAL AND MENTAL HEALTH

The health impacts of COVID-19 are the most obvious outcomes of the pandemic, with the virus both directly and indirectly affecting physical and mental wellness. The virus had taken the lives of at least 710,000 people in the U.S. and infected over 44 million as of October 2021, and in the process it both uncovered and worsened disparities in health care quality, access, and affordability – most notably by income and race/ethnicity.⁹ Simultaneously, the uncertainty, grief, and isolation of the pandemic have contributed to new or worsening mental health issues for many.¹⁰

Respondents below the ALICE threshold were significantly more likely than those above the Threshold to report that they or a household member had ever had a documented health issue. Gaps in reported health issues also existed by race/ethnicity:

- **Mental health:** According to the UAS COVID survey, almost one-third (30%) of respondents had been told by a doctor, nurse, or other health professional that they had a mental health issue like depression or Post Traumatic Stress Disorder (PTSD). This rate was significantly higher for respondents below the ALICE Threshold at 35%, compared to 25% for those above the Threshold (Wave 24 Fielded February 2, 2021–March 3, 2021).
- **Physical health:** Over half of UAS COVID survey respondents (53%) said they had a doctor-diagnosed physical health condition like high blood pressure or diabetes. This rate was high for both groups, and significantly higher for households below the ALICE Threshold (55%) than for respondents above the Threshold (51%).
- **Differences by race/ethnicity:** AIAN/Hawaiian/Pacific Islander respondents below the ALICE Threshold were the most likely to report a significant health issue at almost three in four households (73%). In addition, just over half (52%) of respondents in this group above the ALICE Threshold reported a significant health issue. These extraordinarily high percentages warrant additional research. Among households below the ALICE Threshold, there were significant health issues for more than half (56%) of White respondents, compared to 47% of Black respondents, 45% of Hispanic respondents, and 40% of Asian respondents (Figure 20).

“ We have kept our small children home instead of daycare and had to balance one parent now working full time remotely and the other still needing to report to an office several times a week – the mental toll of the pandemic has been incredible. The anxiety, stress, sadness, and depression...is like nothing I ever could have predicted. ”

– United For ALICE Survey respondent, Greater Fredericksburg Region, Virginia

Figure 20.

Presence of a Significant Health Issue by the ALICE Threshold and Race/Ethnicity

Question: Do you or anyone in your household have a serious health issue or disability? ["Chronic health condition, such as diabetes or a heart condition," "mental disability," "physical disability," or "other serious health issue or disability" selected]

Note: All racial groups include respondents who selected that race alone, except for "AIAN/H/PI," which includes respondents who selected "American Indian or Alaska Native" or "Native Hawaiian or Pacific Islander" alone or in combination with other races (non-Hispanic). The Hispanic ethnic group includes respondents who selected "Spanish, Hispanic, or Latinx" alone or in combination with one or more racial groups.

Source: ALICE Threshold, 2018; United For ALICE COVID Impact Surveys, September 2020–June 2021

Results from the UAS COVID survey also illuminated how mental health has been impacted over time during the pandemic. As shown in Figure 21, the percentage of respondents with mild to moderate symptoms of anxiety and depression peaked in April 2020, while the percentage of respondents with no or few symptoms ("normal" symptomology) dropped. The percentage with mild to moderate symptoms gradually decreased through mid-June 2020 and then remained relatively flat through March 2021.

At almost every point, however, there were significant differences between households above and below the ALICE Threshold. Respondents below the ALICE Threshold were more likely to have mild to moderate or severe symptoms, while respondents above the Threshold were more likely to have few or no symptoms. For example, in April 2020, 44% of respondents below the ALICE Threshold had symptoms above the normal range, significantly higher than the 35% of respondents above the Threshold. By March 2021, rates were lower for both groups, but the gap persisted (29% vs. 19%).

Figure 21.

Symptoms of Anxiety and Depression by the ALICE Threshold, March 10, 2020–March 20, 2021

Note: Mental health groupings shown in this figure are based on responses to the Patient Health Questionnaire-4, a four-question diagnostic survey that measures the core symptoms and signs of depression and anxiety.¹¹

Source: ALICE Threshold, 2018; University of Southern California, Understanding America Study's Understanding Coronavirus in America Survey, March 10, 2020–March 20, 2021

Concerns During the Pandemic: The United For ALICE Surveys provide important insight into the specific worries and concerns that households dealt with during the pandemic and how they differed by income (Figure 22). Across all respondents, the most frequently selected concern was contracting COVID-19 (73%). However, this was significantly more likely to be a concern for respondents above the ALICE Threshold than for those below the Threshold (78% vs. 67%). On the other hand, households below the ALICE Threshold were significantly more likely to be concerned about paying housing expenses (68% vs. 21%), having enough food for the household (52% vs. 13%), paying off debts (48% vs. 24%), child care/education (41% vs. 29%), losing one or more jobs (40% vs. 22%), reduction of hours/wages (40% vs. 22%), and non-COVID-19-related medical issues (34% vs. 29%).

“ Mental health for me personally is poor due to the changes associated from shifting to at-home work, juggling distance learning, adapting to ‘new normal’, learning new technology, and losing the sanctuary of my home (every room is now work/office). ”

– United For ALICE Survey respondent, Florida

Figure 22.
Household Concerns During the Pandemic by the ALICE Threshold

Question: What are your household's concerns during the COVID-19 pandemic?

Note: Respondents could select all that apply. Child care impacts are out of all households, not just households with children.

Source: ALICE Threshold, 2018; United For ALICE COVID Impact Surveys, September 2020–June 2021

When respondents to the United For ALICE Surveys were asked a follow-up question about their biggest concern, the top three responses included worries about contracting COVID-19 (37% of all respondents), paying housing expenses (23% of all respondents), and mental health issues (9% of all respondents). However, the choice and ranking of the biggest household concerns differed by income. The top three concerns for respondents below the ALICE Threshold were paying housing expenses (36%), contracting COVID-19 (25%), and mental health issues (7%). For respondents above the Threshold, the top three concerns were contracting COVID-19 (50%), mental health issues (11%), and child care/education (10%).

Drilling down further, responses by health status provided great insight into who was struggling simply to meet basic needs. Households below the ALICE Threshold with health issues were significantly more likely to be concerned about paying housing expenses (69%), providing food for the household (56%), and paying off debts during the pandemic (48%) than either households below the Threshold without health issues or households above the Threshold with health issues (Figure 23) (United For ALICE Surveys).

Figure 23.

Household Concerns During the Pandemic by ALICE Threshold and Health Status

Households	Paying Housing Expenses	Providing Enough Food for the Household	Paying Off Debts
WITH HEALTH ISSUES			
Below ALICE Threshold	69%	56%	48%
Above ALICE Threshold	26%	17%	29%
WITHOUT HEALTH ISSUES			
Below ALICE Threshold	66%	48%	47%
Above ALICE Threshold	18%	10%	22%

Question: What are your household's concerns during the COVID-19 pandemic?

Source: ALICE Threshold, 2018; United For ALICE COVID Impact Surveys, September 2020–June 2021

In addition, over half (51%) of households below the ALICE Threshold with a health issue said that someone in their household was looking for work during the pandemic (compared to 27% of households above the Threshold with a health issue and 37% of all respondents). These households also faced additional barriers to securing employment. Job-seeking households below the ALICE Threshold with health issues were significantly more likely than job-seeking households above the Threshold with health issues to say that caregiving needs (for a child, older adult, or person with special needs) were a barrier to securing employment (54% vs. 24%). They were also significantly more likely to report other barriers to securing a job including concerns about contracting COVID-19 (44% vs. 36%), existing health issues (31% vs. 26%), transportation issues (20% vs. 9%), and internet access/computer issues (11% vs. 6%).

“ I had a credit card maxed out and lost my health insurance because I couldn’t pay for it. All jobs require either reliable transportation or Internet speeds of 10/5 and I have neither, and have no way to obtain either. I literally don’t have enough money to work. This is not how I thought my life would be at 55. I barely have enough food. I can’t even worry about retiring in 20 years. ”

– United For ALICE Survey respondent, Florida

HOW HOUSEHOLDS MET EXPENSES

With insufficient income and little or no savings, households below the ALICE Threshold struggled before the pandemic, often pushed into difficult, no-win choices to make ends meet. The pandemic added to this stress by further destabilizing ALICE worker income, as well as adding new and unexpected expenses. This section provides the first detailed analysis of the different resources that households above and below the ALICE Threshold had access to and used to get by during the pandemic.

Well into the pandemic (May 2021), the Household Pulse Survey asked respondents to select which of the following actions they or their household members took to meet spending needs over the previous seven days (Figure 24). Most households used regular income sources like those received before the pandemic to cover spending needs, but those above the ALICE Threshold were significantly more likely to use regular income than those below the Threshold (87% vs. 61%).

To cover spending needs, 74% of households below the ALICE Threshold reported using additional income sources (other than regular income sources, like those used before the pandemic) compared to 46% of households above the Threshold. Households below the ALICE Threshold were significantly more likely to have used:

- Stimulus payments (36% vs. 17%)
- Credit cards or loans (30% vs. 26%)
- Money from savings or selling assets (25% vs. 18%)
- Supplemental Nutrition Assistance Program (SNAP) benefits (15% vs. 1%)
- Unemployment insurance (UI) benefit payments (11% vs. 5%)
- Money borrowed from friends and family (19% vs. 4%)

Figure 24.

Ways Households Met Spending Needs by the ALICE Threshold, May 2021

Question: Thinking about your experience in the last 7 days, which of the following did you or your household members use to meet your spending needs?

Note: Respondents could select all that apply.

Source: ALICE Threshold, 2018; U.S. Census Bureau, Household Pulse Survey, Week 30: May 12–May 24, 2021

Significant gaps also existed by race/ethnicity. Most notably, White households below the ALICE Threshold were more likely to have used regular income sources, like those received before the pandemic, to cover spending needs (63%, vs. 57% of Asian and 54% of Black and 51% of Hispanic households). In addition, Black households below the ALICE Threshold were more likely to have borrowed from friends or family (27%, vs. 22% of Hispanic, 18% of White, and 16% of Asian households) and used SNAP benefits (23%, vs. 13% of Hispanic, 14% of White, and 5% of Asian households).

Responses over time to the Household Pulse Survey (April 2020 to May 2021) show that households below the ALICE Threshold experienced more disruptions for a longer period than those above the Threshold. This was especially pronounced for use of regular income sources to cover spending needs, borrowing from friends and family, and UI benefit payments:

- **Regular income sources:** Respondents below the ALICE Threshold were significantly less likely to have used regular income to cover spending needs, with the percentage ranging from 52% to 61%, while the percentage of households above the Threshold using regular income sources remained above 80% throughout this period.
- **Borrowing from friends and family:** Respondents below the ALICE Threshold were significantly more likely to have borrowed from friends or family to cover spending needs, with the percentage ranging from 17% to 29%, while the percentage of households above the Threshold who borrowed from family or friends stayed at or below 6% throughout the period.
- **Unemployment Insurance (UI) benefits:** The percentage of respondents below the ALICE Threshold who used UI benefit payments increased to 20% in August, October, and November 2020, then slowly declined to 11%, while the percentage of households above the Threshold who used UI benefit payments reached 12% in July and August 2020, then declined to 5%.

“ The unemployment [insurance] we received for my husband put us over the limit for qualifying for the EITC for 2020...Without the new stimulus payment coming this week we would not have been able to cover our household bills and expenses. ”

– United For ALICE Survey respondent, Maryland

The November 2020 SHED also asked about community-based support that households received during the pandemic. Respondents below the ALICE Threshold were significantly more likely to report that they received:

- Free groceries or meals through a food pantry, religious, or community organization (22% vs. 4%)
- Financial assistance from friends or family members not living with them (15% vs. 3%)
- Financial assistance from a religious or community organization (4% vs. 1%)

Similar gaps in income were found in the actions participants reported in the United For ALICE Surveys (although at higher rates in this non-representative sample). For respondents below the ALICE Threshold, the top five most selected actions were applying for government assistance programs like SNAP, Temporary Assistance for Needy Families (TANF), and the Special Supplemental Nutrition Program for Women, Infants and Children (WIC) (43%); receiving food from a food pantry/bank (40%); applying for unemployment (40%); borrowing from family or friends (36%); or taking money out of a savings account (33%). For respondents above the ALICE Threshold, fewer actions were taken and the top actions differed – taking money out of a savings account (28%) was most selected, followed by applying for unemployment (19%), increasing a balance on a credit card (19%), and finding a new way to make money (11%). Among respondents above the ALICE Threshold, 39% said that they did not take any of these actions to get by (compared to only 9% of respondents below the ALICE Threshold).

Finally, the Household Pulse Survey provides additional insights into how households used their government-issued Economic Stimulus Payments (\$1,200 for an individual in April 2020, \$600 in December 2020/January 2021, and \$1,400 in March 2021). Based on income limits, 78% of all households and 100% of households below the ALICE Threshold were eligible to receive these payments.¹² The ways in which households used these payments spotlights the differing needs and priorities of households above and below the ALICE Threshold:

- **First stimulus payment** (Household Pulse Survey, July 16–July 21, 2020):
 - Of those who reported receiving a stimulus payment at the time of the survey, households below the ALICE Threshold were significantly more likely than households above the ALICE Threshold to “mostly spend” their stimulus payment (84% vs. 66%) and significantly less likely to add it to savings (4% vs. 17%) or use it to pay off debts (12% vs. 16%).
 - Households below the ALICE Threshold were more likely to use the first stimulus payment to cover basic needs: They were significantly more likely than households above the ALICE Threshold to report using it to pay for food (78% vs. 63%); telecommunications and utilities, including natural gas, electricity, cable, internet, or a cellphone (63% vs. 45%); rent (45% vs. 17%); or vehicle payments (29% vs. 22%).
 - Households above the ALICE Threshold were more likely to put the stimulus funds into savings or investments (19% vs. 8%) or to make a charitable donation (7% vs. 3%). Both groups were similarly likely to report using it to pay down credit card debt, student loans, or other debts (24% vs. 23%).
- **Subsequent stimulus payments:** (Household Pulse Survey, January 20–February 1, 2021):
 - By late January/early February 2021, when most households had received a second stimulus payment, households below the ALICE Threshold had largely shifted from spending the payment (down sharply to 25%) to using it to pay down debt (up sharply to 59%). This percentage was significantly higher than that of households above the ALICE Threshold who used it to pay off debt (44%).
 - Black and Hispanic households below the ALICE Threshold were more likely to use their stimulus payments to pay off debt than White or Asian households below the Threshold (69% and 65%, respectively, vs. 58% and 42%, respectively) and less likely to add to savings (10% and 13%, respectively, vs. 17% and 19%, respectively).

“ Direct financial support for families facing crisis is needed right now. There just isn’t enough support out there to help folks who haven’t ever faced this kind of need before. Cash in hand would change my family’s life, but we haven’t found any we qualify for yet. ”

– United For ALICE Survey respondent, Arkansas

CONCLUSION: ALICE AT A CROSSROADS

The ALICE analysis of the four surveys presented in this Report shows that those who went into the pandemic struggling —starting out with low incomes, low-wage jobs, and little or no savings — were the most vulnerable to the dual impact of the health crisis and the ensuing economic disruption. The differences between how households above and below the ALICE Threshold experienced the pandemic are striking.

Who did better and worse? The November 2020 SHED asked respondents to consider their current financial standing in comparison to 12 months earlier. Respondents below the ALICE Threshold were significantly more likely to report being somewhat or much worse off than those above the ALICE Threshold (34% vs. 17%).

But 19% of respondents below the ALICE Threshold reported being much better off or somewhat better off. Characteristics of this group provide some insight into what helps families to be more financially stable (Figure 25):

- Respondents below the ALICE Threshold who reported being somewhat or much better off were more likely to have worked full time, received a raise or promotion, started a new job, had insurance through an employer or union, maintained a savings or checking account, kept rainy day funds, had a retirement plan on track, and been very confident in approval for credit.
- Those below the Threshold who reported being somewhat or much worse off were more likely to have worked part time, been laid off or lost a job, had household income that varied quite often from month to month, rented rather than owned a home, had to pay an unexpected medical bill out of pocket, owed outstanding credit card debt, had medical debt, set aside no rainy day funds, and not been confident in approval for credit.

Figure 25.
Characteristics of Those Better and Worse Off

Household Characteristics	Respondents Below the ALICE Threshold: Household Financial Status Compared to 12 Months Prior (November 2020–November 2021)	
	MUCH BETTER OFF OR SOMEWHAT BETTER OFF	MUCH WORSE OFF OR SOMEWHAT WORSE OFF
Employment	<ul style="list-style-type: none"> • Full-time job • Received a raise or promotion • Started a new job 	<ul style="list-style-type: none"> • Part-time job • Laid off or lost a job • Household income that varied quite often from month to month
Housing Tenure		<ul style="list-style-type: none"> • Rent
Health Insurance	<ul style="list-style-type: none"> • Insurance through employer or union 	<ul style="list-style-type: none"> • Paid unexpected medical bill out of pocket
Savings, Assets and Debt	<ul style="list-style-type: none"> • Savings or checking account • Rainy day funds • Retirement plan on track 	<ul style="list-style-type: none"> • Unpaid balance on credit card • Medical debt • No rainy day funds
Access to Credit	<ul style="list-style-type: none"> • Very confident in approval chances 	<ul style="list-style-type: none"> • Not confident in approval chances

Note: Differences between groups were significant.

Source: ALICE Threshold, 2018; Federal Reserve Board, Survey of Household Economics and Decisionmaking (SHED), November 2020

Directions for future research: The four surveys analyzed in this Report provide additional insight into the numerous and varied barriers to financial stability that households below the ALICE Threshold face, and they highlight areas for future research. Six barriers that stand out are:

- 1. Factors that lead to stability:** The correlations between characteristics of those who did better or worse during the pandemic suggest important areas for additional research to understand the cause and effect for each factor as well as the impact of a combination of factors. There also needs to be greater understanding of the impact of these factors over time and of long-term sustainability.
- 2. The role of public assistance:** Respondents below the ALICE Threshold who reported being much worse off or somewhat worse off financially were also more likely to report that their household received TANF, SNAP, Supplemental Security Income (SSI), free or reduced-price lunch, stimulus payments, unemployment insurance, Medicare/Medicaid, or free groceries or meals — an indicator that public assistance was reaching those most in need. These households also reported that they were more likely to receive financial assistance from friends or family.

With the release of 2020 decennial census data, news headlines have touted that increased public assistance during the pandemic has reduced poverty.¹³ But if pandemic relief measures are only temporary, many households will fall back into poverty. The ALICE measures demonstrate that insufficient income extends well beyond the official poverty measures, and survey results confirm that even households that were eligible for public assistance continued to struggle during the pandemic. Additional research is needed to understand whether public assistance can serve only as a stopgap measure during a crisis, or whether it can be structured so that it helps households reach long-term financial stability.

- 3. Race/ethnicity:** The consistent discrepancies by race/ethnicity for households above and below the ALICE Threshold strongly suggest that barriers by race/ethnicity are in fact barriers to financial stability in the U.S. today. Additional research is needed to understand how these barriers are perpetuated.

To do so, additional data is needed, especially for smaller racial/ethnic groups including Two or More Races, American Indian or Alaska Native, and Native Hawaiian and Pacific Islander.

- 4. Health:** Households below the ALICE Threshold were more likely to have a member with a serious health issue. These households were also more likely to experience job loss and to have someone in the household looking for work during the pandemic. They also faced additional barriers to securing employment such as caregiving needs (for a child, older adult, or person with special needs), having trouble finding a job, and not being able to find a job that pays enough.

There were significant health issues among more than half (56%) of White respondents below the ALICE Threshold, compared to 47% of Black respondents, 45% of Hispanic respondents, and 40% of Asian respondents.

Additional research is needed to understand how and where else health and race/ethnicity overlap. In particular, the extraordinarily high prevalence of AIAN/Hawaiian/Pacific Islander respondents below the ALICE Threshold with a significant health issue (73%) needs more attention.

“ In addition to the financial impact that this pandemic has had in our community, we have started and will continue to see the emotional scars that the community at large will have once things start to be a little normal again. ”

*– United For ALICE Survey respondent,
Miami-Dade County, Florida*

5. **Additional discrepancies:** In addition to racial/ethnic groups, there are other demographic groups that have long faced barriers to financial security. Additional work is needed in both data collection and analysis to understand the impact of COVID-19 and economic disruption on groups including women; veterans; lesbian, gay, bisexual, transgender, and queer (LGBTQ+) people; recent immigrants by country of origin; undocumented workers; formerly incarcerated people; and people with disabilities.

6. **Long term tracking:** Given what we have learned from previous disasters, it is clear that it can take years for ALICE families to recover financially. Tracking families over time is essential to understanding which supports and policies make a difference. In addition, the long-term health impacts for those who contracted COVID-19 will need to be followed closely since the effects of the virus over time are not yet fully understood, though early research suggests potential for ongoing multi-organ impacts or autoimmune conditions.¹⁴ Chronic health issues will also create additional expenses and employment impacts for individuals and their family caregivers.

APPENDIX A

FEDERAL RESERVE BOARD'S SURVEY OF HOUSEHOLD ECONOMICS AND DECISIONMAKING (SHED)

Overview

Since 2013, the Federal Reserve Board has conducted the Survey of Household Economics and Decisionmaking (SHED), which evaluates the economic well-being of U.S. households and identifies potential risks to their financial stability. The survey includes modules on a range of topics of current relevance to financial well-being, including credit access and behaviors, savings, retirement, economic fragility, and education and student loans.

For more information: <https://www.federalreserve.gov/publications/report-economic-well-being-us-households.htm>

Who Conducted the Survey?

The Board of Governors of the Federal Reserve System

Data Collection Method

Online survey using a nationally representative panel (Ipsos Knowledge Panel)

Frequency/Timing

Surveys included in this analysis were:

- Survey of Household Economics and Decisionmaking conducted in October 2019
- COVID-19 supplemental survey conducted in July 2020 (focused on pandemic impacts)
- Survey of Household Economics and Decisionmaking conducted in November 2020

Sample Size

N-November 2020= 11,648; N-July 2020= 4,174; N-October 2019= 12,173

ALICE Calculations and Considerations

The ALICE Threshold status of survey participants' households were determined using three key components: 1) household income, 2) location, and 3) household composition. Location and family composition were used to identify the appropriate Household Survival Budget (based on 2018 United For ALICE data), which was then compared to the respondent's household income to determine their ALICE Threshold status.

HOW AND WHEN INCOME DATA WAS COLLECTED

Each panelist's income bracket was collected upon their joining the Ipsos Knowledge Panel and published under the variable "I40". For the October 2019 survey, all income information was prior to the pandemic, and the July 2020 supplemental SHED surveyed the same respondents so did not ask for income data again. Since panelists rotate through, roughly one-third of the panel is new each year, for the November 2020 roughly one-third of respondents' income information was collected during the pandemic.

Which of the following categories best describes the total income that you (and your spouse / and your partner) received from all sources, before taxes and deductions, in the past 12 months?

- | | |
|-------------------------|---------------------------|
| 1) \$0 to \$4,999 | 6) \$50,000 to \$74,999 |
| 2) \$5,000 to \$14,999 | 7) \$75,000 to \$99,999 |
| 3) \$15,000 to \$24,999 | 8) \$100,000 to \$149,999 |
| 4) \$25,000 to \$39,999 | 9) \$150,000 to \$199,999 |
| 5) \$40,000 to \$49,999 | 10) \$200,000 or higher |

LOCATION

Each panelist's state of residence was collected upon their joining the Ipsos Knowledge Panel and published under the variable "ppstaten". Smaller geographies (like county or ZIP code) were either not collected or not published. Therefore, the state average Household Survival Budget for each household type was matched to each respondent to determine if their income was above or below the ALICE Threshold.

HOUSEHOLD COMPOSITION

Each panelist's household composition (presence of household members by age) was collected upon their joining the Ipsos Knowledge Panel and published in the following five variables by age:

Presence of Household Members Children 0–1 (ppt01)

Presence of Household Members Children 2–5 (ppt25)

Presence of Household Members Children 6–12 (ppt612)

Presence of Household Members Children 13–17 (ppt1317)

Presence of Household Members Adults 18+ (ppt18ov)

Households were assigned Household Survival Budgets based on their composition. Children aged 0–1 years were assigned infant costs, children 2–5 were assigned preschooler costs, children 6–12 and children 13–17 were assigned school-aged costs. Adults were broken down into non-seniors and seniors.

Race/Ethnicity

The racial/ethnic groupings included in this dataset are as follows:

2+ Races, Non-Hispanic (N-November 2020= 371; N-July 2020= 60; N-October 2019= 400)

Black, Non-Hispanic (N-November 2020= 1,158; N-July 2020= 468; N-October 2019= 1,228)

Hispanic (N-November 2020= 1,423; N-July 2020= 567; N-October 2019= 1,456)

Other, Non-Hispanic (N-November 2020= 571; N-July 2020= 255; N-October 2019= 564)

White, Non-Hispanic (N-November 2020= 8,125; N-July 2020= 2,824; N-October 2019= 8,525)

APPENDIX B

UNIVERSITY OF SOUTHERN CALIFORNIA CENTER FOR ECONOMIC AND SOCIAL RESEARCH'S UNDERSTANDING AMERICA STUDY'S UNDERSTANDING CORONAVIRUS IN AMERICA ("COVID") SURVEY (UAS COVID SURVEY)

Acknowledgement

The project described in this paper relies on data from survey(s) administered by the Understanding America Study, which is maintained by the Center for Economic and Social Research (CESR) at the University of Southern California. The content of this paper is solely the responsibility of the authors and does not necessarily represent the official views of USC or UAS. The collection of the UAS COVID-19 tracking data is supported in part by the Bill & Melinda Gates Foundation and by grant U01AG054580 from the National Institute on Aging, and many others.

Overview

The Understanding America Survey, conducted by the University of Southern California, is a nationally representative, probability-based online panel of adults who were drawn from the more than 9,000 members of the UAS. The margin of sampling error is plus or minus 1 percentage point.

Link for more information: <https://uasdata.usc.edu/index.php>

Who Conducted the Survey?

The University of Southern California Dornsife Center for Economic and Social Research

Data Collection Method

The study relies on an "Internet Panel," which means that respondents answer surveys on a computer, tablet, or smartphone, wherever they are and whenever they wish to participate.

Frequency/Timing

Per UAS: "The first survey was fielded on March 10, 2020. The survey was in the field until April 1. In contrast to later waves, all respondents were invited on March 10. The distribution of responses over the survey period is therefore not random and concentrated in the first part of the survey period (see the Survey Methods tab on the [COVID-19 Pulse site](#)). As of April 1, a new survey is fielded every two weeks. Each day one-fourteenth of the respondents are invited to take the survey. Since respondents have two weeks to answer the survey, the total field period is four weeks, so that responses during the last two weeks of a field period of one survey overlap with responses in the first two weeks of the subsequent survey. For more information about survey waves, see <https://uasdata.usc.edu/index.php>"

Sample Size

Surveys are ongoing with approximately 7,000 people participating in each wave.

ALICE Calculations and Considerations

The ALICE Threshold status of each survey participant's household was determined using three key components: 1) household income, 2) location, and 3) household composition. Location and family composition were used to identify the appropriate Household Survival Budget (based on 2018 United For ALICE data), which was then compared to the respondent's household income to determine their ALICE Threshold status.

HOW AND WHEN INCOME DATA WAS COLLECTED

Income was collected when respondents joined the panel (updated quarterly) using the following income brackets:

- | | |
|----------------------|------------------------|
| 1) Less than \$5,000 | 9) 30,000 to 34,999 |
| 2) 5,000 to 7,499 | 10) 35,000 to 39,999 |
| 3) 7,500 to 9,999 | 11) 40,000 to 49,999 |
| 4) 10,000 to 12,499 | 12) 50,000 to 59,999 |
| 5) 12,500 to 14,999 | 13) 60,000 to 74,999 |
| 6) 15,000 to 19,999 | 14) 75,000 to 99,999 |
| 7) 20,000 to 24,999 | 15) 100,000 to 149,999 |
| 8) 25,000 to 29,999 | 16) 150,000 or more |

LOCATION

Each respondent's state of residence was collected and published under the variable "STATERESIDE". Smaller geographies (like county or ZIP code) were either not collected or not published. Therefore, the state average Household Survival Budget for each household type was matched to each respondent to determine if their income was above or below the ALICE Threshold.

HOUSEHOLD COMPOSITION

Household composition (presence of household members by age) was collected and reported using the following variable:

HHMEMBERAGE_1-18 up to 18 individuals in a household by age

Race/Ethnicity

The racial/ethnic groupings included in this dataset include Hispanic, non-Hispanic, American Indian/Alaska Native, Asian, Black, Native Hawaiian/Pacific Islander, and White. Race/ethnicity data for this dataset is not used in this Report.

APPENDIX C

U.S. CENSUS BUREAU COVID-19 HOUSEHOLD PULSE SURVEY (HOUSEHOLD PULSE SURVEY)

Overview

To help understand the social and economic impacts of COVID-19 on American households in near real-time, the U.S. Census Bureau developed the Household Pulse Survey in partnership with five federal statistical partner agencies: the Bureau of Labor Statistics, the National Center for Health Statistics, the United States Department of Agriculture's Economic Research Service, the National Center for Education Statistics, and the Department of Housing and Urban Development. The survey was designed to meet the goal of accurate and timely weekly estimates.

Link for more information:

<https://www.census.gov/programs-surveys/household-pulse-survey/technical-documentation.html>

Who Conducted the Survey?

U.S. Census Bureau

Data Collection Method

The Household Pulse Survey is a 20-minute online survey. Respondents are selected from housing units in the Census Bureau's Master Address File (MAF) where at least one email address or cell phone number is known. Sampled households are sent the survey link by email and text if both are available, by email if no cellphone number is available, and by text if no email is available. Because personal visits are not possible during COVID19, follow-up is pursued with the emails and/or cell phones associated with the address until a response is received. Once a complete interview is obtained from a household, that household remains in the sample for up to two additional weekly interviewing periods.

Sample Size

N-Week 12 (July 16–July 21, 2020)= 86,792; N-Week 13 (August 19–August 31, 2020)= 109,051; N-Week 23 (January 20–February 1, 2021)= 80,567; N-Week 30 (May 12–24, 2021)= 72,897

Frequency/Timing

Phase 1 began April 23, 2020, and ended on July 21, 2020, and was collected weekly. Phase 2 began August 19, 2020, and was collected biweekly, as with all subsequent phases. Phase 3.2 is currently underway and is scheduled to continue until October 2021.

ALICE Calculations and Considerations

The ALICE Threshold status of each survey participant's household was determined using three key components: 1) household income, 2) location, and 3) household composition. Location and family composition were used to identify the appropriate Household Survival Budget (based on 2018 United For ALICE data), which was then compared to the respondent's household income to determine their ALICE Threshold status.

HOW AND WHEN INCOME DATA WAS COLLECTED

Participants answered the following question (respondents' 2019 household income before taxes was used to capture pre-COVID-19 income):

In 2019, what was your total household income before taxes?

- | | |
|------------------------|--------------------------|
| 1) Less than \$25,000 | 5) \$75,000 - \$99,999 |
| 2) \$25,000 - \$34,999 | 6) \$100,000 - \$149,999 |
| 3) \$35,000 - \$49,999 | 7) \$150,000 - \$199,999 |
| 4) \$50,000 - \$74,999 | 8) \$200,000 and above |

LOCATION

Each respondent's state of residence was collected and published under the variable "EST_ST". Metropolitan Statistical Area was also collected but was not a reliable variable for calculating ALICE Threshold status, as data was missing for non-metropolitan areas. Smaller geographies (like county or ZIP code) were either not collected or not published. Thus, the state average Household Survival Budget for each household type was matched to each respondent to determine if their income was above or below the ALICE Threshold.

HOUSEHOLD COMPOSITION

Each panelist's household composition (presence of household members by age) was collected in the surveys and reported using the following two variables:

Total number of people under 18-years-old in household (THHLD_NUMKID)

Recode for the number of Adults in the household (THHLD_NUMADLT)

Respondents were assigned Household Survival Budgets based on their responses. The specific ages of children were not reported; therefore, all children were assigned the budget costs for a school-age child. Adults were assigned adult costs as indicated by the respondent.

Race/Ethnicity

The racial/ethnic groupings included in this dataset are as follows:

Hispanic (N-Week 13 (August 19–August 31, 2020)= 10,208; N-Week 23 (January 20–February 1, 2021)= 7,943)

Non-Hispanic (N-Week 13 (August 19–August 31, 2020)= 98,843; N-Week 23 (January 20–February 1, 2021)= 72,624)

Asian, Alone (N-Week 13 (August 19–August 31, 2020)= 5,722; N-Week 23 (January 20–February 1, 2021)= 3,968)

Black, Alone (N-Week 13 (August 19–August 31, 2020)= 9,366; N-Week 23 (January 20–February 1, 2021)= 6,153)

White, Alone (N-Week 13 (August 19–August 31, 2020)= 88,545; N-Week 23 (January 20–February 1, 2021)= 66,522)

Any other race alone, or race in combination (N-Week 13 (August 19–August 31, 2020)= 5,418; N-Week 23 (January 20–February 1, 2021)= 3,924)

APPENDIX D

UNITED FOR ALICE COVID-19 IMPACT SURVEYS (UNITED FOR ALICE SURVEYS)

Overview

From September 2020 to June 2021, over 45,000 people responded to state surveys in Arkansas, Florida, Indiana, Maryland, New York, and Tennessee, and regional surveys in Franklin County, Ohio (Columbus), Roanoke Valley, Virginia, Shenandoah Valley, Virginia, and the Greater Fredericksburg Region, Virginia, about how their households have been impacted by the COVID-19 pandemic since March 1, 2020. The surveys were conducted by United Ways and local collaborators in partnership with United For ALICE. These surveys relied on convenience sampling and are not a representative sample of the national population. However, the respondents match national demographics in terms of race/ethnicity, age, and urban/rural location. With this caveat, the combined results of these surveys provide important insights into the issues ALICE households faced during the pandemic.

For more information: contact Info@UnitedForALICE.org

Who Conducted the Survey?

United For ALICE, in partnership with state and local United Ways

Data Collection Method

Online surveys

Frequency/Timing

Surveys were conducted between September 2020 and June 2021

Sample Size

N = 45,057

ALICE Calculations and Considerations

The ALICE Threshold status of each participant's household was determined using three key components: 1) household income, 2) location, and 3) household composition. Location and family composition were used to identify the appropriate Household Survival Budget (based on 2018 United For ALICE data), which was then compared to the respondent's household income to determine their ALICE Threshold status.

HOW AND WHEN INCOME DATA WAS COLLECTED

Participants answered the following question (2019 or 2020 was used as the reference year, depending on when the survey was in the field):

What was your household income last year before taxes?

- | | |
|-------------------------|---------------------------|
| 1) Less than \$25,000 | 5) \$75,000 to \$99,999 |
| 2) \$25,000 to \$34,999 | 6) \$100,000 to \$149,999 |
| 3) \$35,000 to \$49,999 | 7) \$150,000 or more |
| 4) \$50,000 to \$74,999 | |

LOCATION

Respondents were asked to provide their zip code and county of residence. The county-level Household Survival Budget for each household type was matched to each respondent to determine if their income was above or below the ALICE Threshold.

HOUSEHOLD COMPOSITION

Each respondent's household composition (presence of household members by age) was collected using the following question:

How many children, adults, and seniors are in your household – including yourself?

Adults (18 to 64 years old)

Seniors (65 years or older)

Children (0 to 5 years old)

Children (6 to 17 years old)

Race/Ethnicity

The racial/ethnic groupings included in this dataset are as follows:

American Indian or Alaska Native, Native Hawaiian or Pacific Islander, alone or in combination with other races; non-Hispanic (N= 576)

Asian, alone (N= 536)

Black or African American, alone (N= 6,073)

Spanish, Hispanic, or Latinx, alone or in combination (N= 5,022)

White, alone (N= 30,216)

Primary issue:

Affordable childcare is a struggle for most working families in the United States. Subsidized childcare provides financial support for some low-income parents so they can work or enroll in training and obtain a higher-paying occupation. However, in many instances, the federal eligibility limits hit before families can independently pay for the full cost of childcare without sacrificing other basic household expenses. To help parents receiving subsidized childcare advance in their careers, changes to policy and funding can address affordability of childcare and eliminate the benefits cliff to support economic mobility.

Key findings:

Based on case study analysis in Florida, the authors describe childcare affordability challenges. The current federal eligibility limit is not consistent with the amount of earnings needed for families to absorb the full cost of childcare without forgoing other basic household expenses. Cost of living and wage variation means that affordability challenges differ across communities. Extending subsidy eligibility to a measure of economic self-sufficiency that is based on the minimum household budget needed to cover expenses independently would address the affordability challenges. Gradually increasing parental contributions to the cost of childcare in alignment with increased earnings can eliminate the benefits cliff. There is an associated cost to government to implement these changes, which could be offset by a longer-term return on investment in the form of reduced public benefits and increased tax contributions by working families.

Takeaways for practice:

Understanding the potential gaps between the established eligibility limit for subsidized childcare and minimum household budget needed to afford childcare independently without sacrificing other basic household expenses can inform community, state, and federal funding and policy considerations. More flexible federal regulations could enable states to extend eligibility in areas with higher living costs to better support childcare affordability and pathways to economic self-sufficiency. States can develop strategies for mitigating the benefits cliff by creating an off-ramp that features a graduated phaseout of subsidy when families can afford childcare costs independently. Federal, state, and community resources can potentially be allocated to bridge the existing funding gaps.

The Federal Reserve Bank of Atlanta's Community & Economic Development (CED) Discussion Paper Series addresses emerging and critical issues in community development. Our goal is to provide information on topics that will be useful to the many actors involved in community development—governments, nonprofits, financial institutions, and beneficiaries. Restructuring the Eligibility Policies of the Child Care and Development Fund to Address Benefit Cliffs and Affordability: Florida as a Case Study

Abstract:

This paper explores how the current eligibility policies of the federal Child Care and Development Fund (CCDF) create benefits cliffs that act as barriers to economic self-sufficiency. By examining Florida data and policies, the authors demonstrate how the program's existing co-payment schedule affects the same hypothetical family living in two contrasting Florida counties: one with state median living costs and one with high living costs. The authors find that the CCDF income eligibility exit threshold is too low, particularly in high-cost counties. That occurs because the exit threshold is based on the state median income, as opposed to more local measures that better approximate and reflect local cost of living. The authors propose and calculate the additional family and government costs of two alternative CCDF phase-out designs, which would remove the CCDF benefits cliffs. Both proposed alternatives feature smooth phase-out schedules that align the subsidies with the local cost of childcare, thereby reducing barriers to economic mobility unintentionally created by government policies.

JEL classification: I38, J08, J13, J24

Key words: childcare, benefits cliffs, human capital, skills, provision and effects of welfare programs, effective marginal tax rates

Affordable high-quality childcare is a struggle for most parents in the United States. We estimate that only 44 percent of U.S. families with children under the age of 13 can afford the full price of childcare without having to sacrifice other basic needs such as housing, food, health care, and transportation.¹ Although the U.S. government has many programs intended to support working families with young children, design and funding constraints can significantly limit their reach and effectiveness. In this paper, we focus on the largest childcare subsidy program in the United States: the Child Care and Development Fund, or CCDF (Office of Child Care, 2019). CCDF, also known as the Child Care and Development Block Grant, is administered by the Office of Child Care at the U.S. Department of Health and Human Services (HHS) and provides block grants to states, which are used to subsidize the childcare expenses of eligible working families with children under age 13 so they can work or attend a job training or educational program. We focus on two design features of the current CCDF design, which we argue can reduce the incentives for seeking greater income, decreasing economic mobility.

The first design feature is the lack of a smooth co-payment schedule toward the exit eligibility threshold. For families that are currently receiving a CCDF voucher, eligibility is defined by states and ends once their income passes a certain threshold—usually 85 percent of state median income (SMI), the highest allowable threshold per federal regulations. For families close to this threshold, a modest wage increase can push earnings above it, with the value of the lost subsidy often being greater than the increase in earnings. This is known as a benefits cliff. The size of the benefits cliff depends on the value of the subsidy near the income eligibility threshold. States ultimately determine how the value of the subsidy phases out as income increases. CCDF requires a family co-pay contribution toward the cost of childcare, and states establish the subsidy value and the family co-payment schedule. Thus, while CCDF is a federal program, states have some ability to mitigate the cliff effect. Many states' co-payment schedules, however, do not feature a smooth subsidy phase-out schedule all the way to the exit eligibility threshold, and thus it creates a large benefits cliff. This is the case in Florida.

The second design feature is the level of the exit eligibility threshold. Arguably, a benefits cliff may not present an insurmountable barrier if it is phased out at a level commensurate with the amount needed to pay all expenses (including childcare). However, we find that across all of Florida, only 3 percent of the population live in counties where a family with two adults and two young children can afford the full cost of childcare at the CCDF eligibility threshold without forgoing other basic needs. Furthermore, these cliffs are

¹ We find this number by applying the University of Washington Self-Sufficiency Standard to the 2018 American Community Survey (ACS). We aggregate the Self-Sufficiency Standard data to metro and nonmetro geographic level and merge to all households in the ACS by state, metro/nonmetro, number of adults, and number of kids. We then compare the income level of the household to the Self-Sufficiency Standard to determine what share of households with children under 13 can afford the full set of basic expenses approximated by the standard.

exacerbated in high-cost areas. For a family composed of two adults and two young children, the size of the cliff at the eligibility threshold can be as high as \$16,000. The average estimated disparity between the 85 percent SMI eligibility threshold and the amount of additional income needed to afford all expenses is \$11,000 across all counties in Florida for such families.

In this paper, we examine the design of CCDF as currently established in Florida. According to the U.S. Health and Human Services Department, two key objectives of the CCDF co-payment schedule are: 1) subsidy rates that reflect families' abilities to pay regardless of the number of children in care or the price charged by the provider; and 2) to minimize the benefits cliff effect by establishing a gradual subsidy phaseout schedule (National Center on Subsidy Innovation and Accountability, 2018). Our analysis demonstrates the challenges of meeting these objectives within the current design of the program. Specifically, we demonstrate how geographic variation in childcare costs can create different-sized cliffs and how CCDF families living in counties with high overall living costs face disproportionately large barriers to economic mobility relative to lower-cost counties.

This paper proceeds as follows. Section I provides background on the consequences of unaffordable childcare as well as an overview of the CCDF program and its limitations. Section II examines how the existing CCDF phaseout schedule differentially affects families in different areas of Florida by presenting two contrasting counties: one with median living costs and one with high living costs. Two proposed alternative structures of the CCDF subsidy are presented in Section III. The first alternative keeps the co-pay schedule as it is and expands the eligibility thresholds to the point at which families can afford unsubsidized childcare without having to forgo other basic needs.² The second alternative is an entirely different co-pay schedule, which increases gradually with income and phases out at the point when a family is able to afford childcare without sacrificing other basic needs. In Section IV, we examine the implications of both alternative structures on the costs to individual families as well as to the government and discuss the trade-offs associated with each alternative. Section V provides concluding context and considerations.

² To estimate childcare costs, we use data from the University of Washington's Self-Sufficiency Standard. The standard's measure of childcare costs assumes market rate costs (at the 75th percentile). Costs vary by age of child and county of residency.

Section I: Background

Childcare affordability

To better understand financial constraints for families with young children, we begin by estimating the share of the population in the United States that could potentially afford a basic set of expenses. We use the University of Washington’s Self-Sufficiency Standard (“the standard”) to determine what constitutes a basic set of expenses and to determine the amount of those expenses in every county in the United States.³ We then use county-level data from the 2018 American Community Survey (ACS) and compare total reported income from all sources (including reported receipt of government assistance) to a basic set of expenses provided by the standard for all families in the ACS. We estimate that only 44 percent of U.S. families with children under 13 years old could potentially afford the full price of center-based childcare without having to sacrifice their budget for other basic needs such as housing, food, health care, and transportation.⁴ Indeed, childcare makes up a significant share of a typical family’s budget. Among all families in the ACS that potentially need childcare, the median estimated share of a self-sufficiency budget allocated toward childcare is 17 percent. For comparison, the median estimated share of the budget spent on housing—often the largest basic expense—is 19 percent.⁵ For families that do not have the income necessary to meet a self-sufficiency budget, the relative expense of childcare is much higher. Alternatively, these families would have to switch to a different (possibly lower quality) form of childcare.

Negative social and economic consequences of unaffordable childcare

A lack of access to quality, affordable childcare can negatively affect economic growth by limiting the labor force participation of parents and challenging career advancement opportunities (Danziger et al., 2014). Challenges with childcare affordability can ultimately force parents who want to work to stay home with their children, work fewer hours, or turn

³ The up-to-date University of Washington Self-Sufficiency Standard is available only for 28 states. For the remaining states, we use data from the Cost-of-Living Database (Ilin and Terry, 2021), which closely matches the standard’s methodology.

⁴ We assume that the family potentially needs childcare if both parents are working and the family has at least one child under the age of 13.

⁵ Calculations are based on the 2019 American Community Survey and the University of Washington Self-Sufficiency Standard. Housing includes HUD’s measure of fair market rent and utilities for the area. The Department of Health and Human Services considers childcare affordable if no more than 7 percent of a family’s budget is allocated toward it (Child Care and Development Fund [CCDF] Program, 2016). Note, this figure does not depend on the level of income of the family, which we argue in this analysis is an important consideration.

down higher-paying jobs in order to remain eligible for childcare assistance from the government.⁶ If parents avoid taking higher-paying jobs in order to keep government assistance, this can result in a net loss to the taxpayers in the long run, in the form of hundreds of thousands of foregone employment taxes and greater government assistance payments (Altig, et al., 2020, revised 2021). According to analysis by the Council of Economic Advisers, as of 2016 there were 3.8 million nondisabled, working-age parents with children under age 6 outside the labor force, and another 6.6 million such parents with children under age 13 working part-time (Council of Economic Advisers, 2019). Therefore, making childcare more affordable could help up to 10.4 million parents choose to enter the labor force or increase their work hours. That would reflect a 6.5 percent increase in the 2016 U.S. labor force.⁷

For many parents who decide to have children and stay in the labor market, the inability to afford quality childcare can have negative effects on children's development. Families may need to reduce their living standard to afford childcare and continue to work or avoid taking a higher-paying job so they do not lose government assistance. If they must sacrifice adequate housing and health care, this can adversely affect parents as well as children and lead to financial and psychological stress. For example, Dahl and Lochner (2012) find a positive effect of family's income on child development. They estimate that a \$1,000 increase in annual income raises combined math and reading scores of children by 6 percent of a standard deviation of a normalized mean score. Duncan, Morris, and Rodrigues (2011) find similar results. Their estimates show that a \$1,000 increase in annual income increases young children's achievement by 5 to 6 percent of a standard deviation.

Alternatively, parents might choose lower-quality childcare that is more affordable. However, quality childcare matters for the healthy development of children at early ages. Neuroscientists and developmental psychologists have established that the first five years of a child's life are critical for the development of language and cognition as well as executive functioning skills. For example, Gialamas et al. (2014) found that low-quality childcare can adversely affect children's task attentiveness and emotional regulation. A study of early childcare conducted by the National Institute of Child Health and Human Development (NICHD) found that higher-quality childcare is associated with positive outcomes such as better mother-child relationship, fewer reports of problem behaviors, higher cognitive performance, and higher language skills (NICHD, 2005). The NICHD study measured quality childcare in many ways, including adult-to-child ratios, group sizes, training of staff, and day-to-day interactions and activities between children and staff.

⁶ Morrissey (2017) provides a detailed review of the literature on the relationship between childcare and parents' labor market behavior.

⁷ As of December 2016, the U.S. labor force was approximately 159 million people (FRED, accessed February 18, 2021).

Thus, it is not surprising that investments in early childhood development are known to have positive returns on investments. For example, Grunewald and Rolnick (2003) estimated the real internal rate of return (a useful metric for comparing public with private investment) of a 1960s Perry School program, which provided two-and-one-half-hour classroom sessions for three- to four-year-old children and an hour-and-a-half home visits on weekday afternoons, to be 16 percent. These benefits were realized in the form of fewer crimes and class disruptions, decrease in welfare payments, and higher earnings for program participants (Grunewald and Rolnick, 2003). In particular, investment in early childhood development has been found by many to yield much higher returns compared to interventions implemented later (Cunha and Heckman, 2007; Heckman, 2006; and Konstantopoulos, 2011).

Government childcare assistance through the CCDF

Federal and state governments directly subsidize the cost of childcare for low-income working parents through the Child Care and Development Fund. The current program design, however, has features that arguably limit its effectiveness. We refer to “effectiveness” as the extent to which an activity achieves its intended objectives, independent of costs (Salamon, 2002). In this analysis, we specifically focus on the co-payment schedule of CCDF. Other design features of CCDF not included in this analysis are: 1) definitions of countable income and 2) the block grant nature of the program. We choose to focus on the co-payment schedule because this element of the program design has the potential to affect the economic mobility of program participants. As mentioned in the introduction, two key objectives of the CCDF co-payment schedule that we focus on are: 1) that subsidy rates reflect families’ ability to pay and 2) to minimize the benefits cliff effect (National Center on Subsidy Innovation and Accountability, 2018).

The Child Care and Development Fund, also known as the Child Care and Development Block Grant, is administered by the Office of Child Care at the U.S. Department of Health and Human Services (HHS). It provides block grants to states, which are used to subsidize the childcare expenses of eligible working families with children under age 13 so they can work or attend a job training or educational program. In addition to providing funding for childcare services, funds are also used to improve the overall quality and supply of childcare for families in general. In 2018, CCDF served 1.3 million children and 813,200 families. In the state of Florida, these numbers are 99,100 and 70,500, respectively (Office of Child Care, 2019). The program is administered by states, territories, and tribes with funding and support from the HHS Administration for Children and Families’ Office of Child Care.

Not all eligible families receive subsidies because of limited CCDF funds. Fewer than one in six qualified households receive childcare support (Chien, 2015). Among those families that obtain CCDF vouchers, the program’s effectiveness is limited by eligibility thresholds and

phaseout schedules, which do not always allow for a smooth financial transition from the program. As a block grant, the program allows states certain discretion over CCDF rules. This includes the authority to establish initial income eligibility thresholds, continuous income eligibility thresholds, and co-pay schedules, provided they are within certain parameters. CCDF has two income eligibility thresholds: initial eligibility (at entry) and exit eligibility (at redetermination). Federal regulations require that states keep the income eligibility threshold at or below 85 percent of the state median income (SMI) for a family of a given size for either threshold.⁸ States can choose to set a different threshold for initial eligibility and exit eligibility, or they can choose the same threshold for both. A state that chooses to set the initial eligibility threshold below the exit eligibility threshold must provide a graduated phaseout co-pay schedule between the two thresholds. For states that have a phaseout co-pay schedule, most states implement one of the following three types of phaseout co-pay schedules: 1) co-pay as a share of income, where the share of income increases as income increases; 2) co-pay as a share of expense, where the share of expense increases with increases in income; and 3) fixed co-pay levels for different income brackets, with co-pay levels being higher for upper-income brackets. In Florida—which is the focus of the paper—the CCDF program design features two separate eligibility thresholds. The initial enrollment (“entry”) threshold is 150 percent of the federal poverty level (FPL) and the exit eligibility threshold is 85 percent of the SMI. Florida’s co-payment schedule design is the third type described above: fixed co-pays for different income brackets.

Commonly, the co-pay schedule for CCDF is not established with a smooth transition toward the eligibility threshold. Instead, co-pays tend to remain relatively low and then escalate considerably at 85 percent of SMI when families must absorb the full cost of childcare. This design keeps family contributions low when earnings are lower, but families can still experience significant financial hardship at the upper eligibility limit. If ineligibility for a continued subsidy is a result of a modest income increase, the result can be a loss to net family resources, also known as a benefits cliff. The gradual phaseout of subsidies is an attempt to meet the dual objectives of CCDF—to minimize the benefits cliff while keeping payments affordable. However, this design results instead in the cliff being pushed to a higher income level. If the income level at which CCDF is lost is insufficient for a family to afford the full cost of childcare, families that experience a benefits cliff may have to make financial sacrifices to basic household expenses to absorb childcare spending fully and continue to work. In some cases, this financial dilemma may result in some families “parking” their income below the

⁸ Chien, Minton, and Giannarelli (2017) simulate the effect of a 200 percent federal poverty level eligibility threshold and estimate increases in mother’s employment and the number of children aged birth to three who receive subsidies.

eligibility threshold to keep their childcare subsidy.⁹ Given the high cost of childcare and challenges to pay for it independently, instead of helping low-income working families on a path to self-sufficiency, CCDF subsidies can effectively trap them below the 85 percent SMI threshold.

An example from Florida

In Florida, the CCDF structure is as follows. Florida has a fixed co-pay level for each of 17 different income brackets, and the co-pay levels gradually increase with higher-income brackets. The highest-income bracket ends at 85 percent of SMI. The resulting value of the CCDF subsidy is obtained by subtracting private market costs from the amount of the co-pay. The total amount of the co-pay additionally depends on the number of children under 13 a family has and whether the child(ren) need full-time or part-time care. To demonstrate how CCDF subsidies help families of different income levels, Figure 1 shows the value of the CCDF subsidy for a hypothetical two-parent household with two children living in Palm Beach County, Florida. We chose to analyze the case of two adults and two children because it is the most common family type among families with children in the United States.¹⁰ The ages two and three are chosen because the costs are a middle ground between more expensive infant care and less expensive after-school care for older children.

⁹ Romich (2006) studied 60 households over three years in the New Hope Ethnographic Study and found no instances of individuals turning down raises or promotions to avoid benefits losses. However, Roll and East (2014) surveyed 332 families utilizing the CCDF program in four Colorado counties and found that 33 percent of survey respondents have turned down a raise, not taken a new job, not worked additional hours, not gotten married, or not turned in their redetermination paper in order to keep their childcare subsidies. For a review of the literature that studies the effects of public assistance programs on labor supply, see Moffit (2002).

¹⁰ Among families with children, the most common family type is two adults and two children (25 percent). The second most common family type is two adults and one child (20 percent). The third most common type is two adults and three children (12 percent). See Appendix A for further details.

Figure 1: CCDF Subsidy by Employment Income

Note: Assumes family of two adults and two children, aged two and three living in Palm Beach County, Florida.

Source: Policy Rules Database (Ilin and Terry, 2021)

As Figure 1 shows, the value of CCDF declines as wages increase because the co-pay increases with higher levels of income. This hypothetical family loses childcare assistance completely when their income exceeds \$59,580, the eligibility threshold (85 percent of 2019 SMI) for a family of four in Florida in 2020.¹¹ The estimated value of the voucher starts at nearly \$20,000 and declines to \$13,360 right before the income eligibility threshold is reached. Thus, if the family’s income were \$59,000 and they received a \$1,000 wage increase, the family would experience a net financial loss of \$13,630, corresponding to a 19 percent decline in their total financial resources including income and CCDF.¹² The loss of the CCDF subsidy is the largest financial loss associated with reaching eligibility limits for any government assistance program (see Appendix B).

¹¹ The 2020 CCDF program rules in Florida used SMI from 2019 to determine income eligibility.

¹² See Appendix B for a chart that includes other government assistance programs, such as SNAP. The value of the CCDF program is approximated by the 75th percentile of a state-wide market rate survey of childcare providers in the county minus the co-pay for that income level.

A look at the CCDF income eligibility threshold

According to the final rule of CCDF, if states choose to set their continuous income eligibility limits below 85 percent of SMI, they should choose a “level sufficient for the family to reasonably afford quality childcare without assistance, based on the typical household budget of a low-income family. This approach promotes continuity of care for children while allowing for wage growth for families to move on a path toward economic stability” (CCDF Final Rule, 2016). Although this directive is specifically about states that do not set continuous income eligibility at 85 percent SMI, this statement implies that 85 percent of SMI adequately captures families’ ability to pay the full cost of childcare in the United States without any assistance and without forgoing other basic needs. A key question for this analysis is whether 85 percent of SMI is a realistic threshold.

One way to evaluate this question is to compare 85 percent of SMI to the cost of living in each state. In this paper, we use the University of Washington Self-Sufficiency Standard (the “standard”) as a proxy for the cost of living in an area. The standard is a budget-based measure of the real cost of living and an alternative to the official poverty measure. It determines the amount of income required for working families to meet basic needs at a minimally adequate level, taking into account family composition, ages of children, and geographic differences in costs. The standard defines the amount of income necessary to meet basic needs (including taxes) without public assistance, nonprofit or informal assistance (such as free babysitting by a relative or friend, or food provided by churches or local food banks). The standard includes the costs of childcare, food, housing, health insurance, other expenses such as clothing, taxes (net of tax credits), and employment-related transportation.

Figure 2 shows the CCDF income eligibility threshold (85 percent of SMI) compared to the average standard for a family of four in each state of the United States and the District of Columbia as well as a 45-degree line.¹³ Points on the chart that are below the 45-degree line represent states where the standard is higher than 85 percent of SMI. In areas where the standard is higher than the 85 percent of SMI, the CCDF threshold is not a good proxy for the ability of families to pay for childcare without government assistance, as in Florida (the orange dot). In total, in about half of states (25 out of 50 states and the District of Columbia) there is a shortfall between the CCDF threshold and the standard. If families are living below the standard and do not qualify for CCDF, they would have to rely on other means of support, reduce expenses as noted above, or face a trade-off between labor market participation and quality childcare.

¹³ The standard is available at the county level; population weights are used to obtain the state average.

Figure 2: Relationship between Exit Eligibility Threshold and the Standard

Note: The orange dot is Florida. A map of this data is shown in Appendix C.
 Sources: University of Washington, U.S. Census Bureau, and authors' calculations

Even within a state, there can be a significant variation in income and living costs that inhibit the ability of CCDF to meet the needs of low-income working families. For example, there is significant variation in the standard across counties in Florida. The standard for the most expensive county—Monroe—is \$87,743. In contrast, in the least expensive county—Suwanee—the standard is \$55,371.

Figure 3 shows a horizontal line indicating the CCDF cutoff for a family with two adults and two young children in Florida (\$59,580) compared to the standard for each county. As the chart shows, in most counties the CCDF threshold is too low, according to this measure. The average two-adult and two-young-children family faces an annual financing gap of nearly \$11,000, and there is significant heterogeneity in cost of living across the state. Only 11 counties have a standard below the CCDF threshold. The county with the largest gap between the CCDF threshold and the standard is Monroe (\$28,000). Further, the state's population is

concentrated in the counties where the standard is above the threshold. Ninety-seven percent of the state’s population live in counties where the amount of income needed for self-sufficiency is above the eligibility threshold for this family type. Fifty-seven percent of the population live in counties where the standard for this family type is at least \$10,000 higher than the CCDF threshold (as indicated by the red bars), and 40 percent of the population live in counties where the standard is less than \$10,000 higher than the CCDF threshold (indicated by the orange bars).

Figure 3: CCDF Threshold and the Standard by Florida Counties

Note: Assumes family of two adults and two children, aged two and three. The width of the bar represents the population size of the county, where larger width bars correspond to relatively higher county populations. Counties marked in red have a standard that is at least \$10,000 higher than 85 percent SMI, counties in orange have a standard that is less than \$10,000 higher than the standard, and counties in gray have a standard that is less than 85 percent of SMI.

Sources: University of Washington, U.S. Census Bureau, and authors’ calculations

The inadequacy of using SMI as a proxy for the affordability of childcare across and within states is the focus of Section III of this paper where we discuss alternatives to the existing eligibility threshold for CCDF. These alternatives factor in local costs of living as opposed to using the statewide income threshold alone.

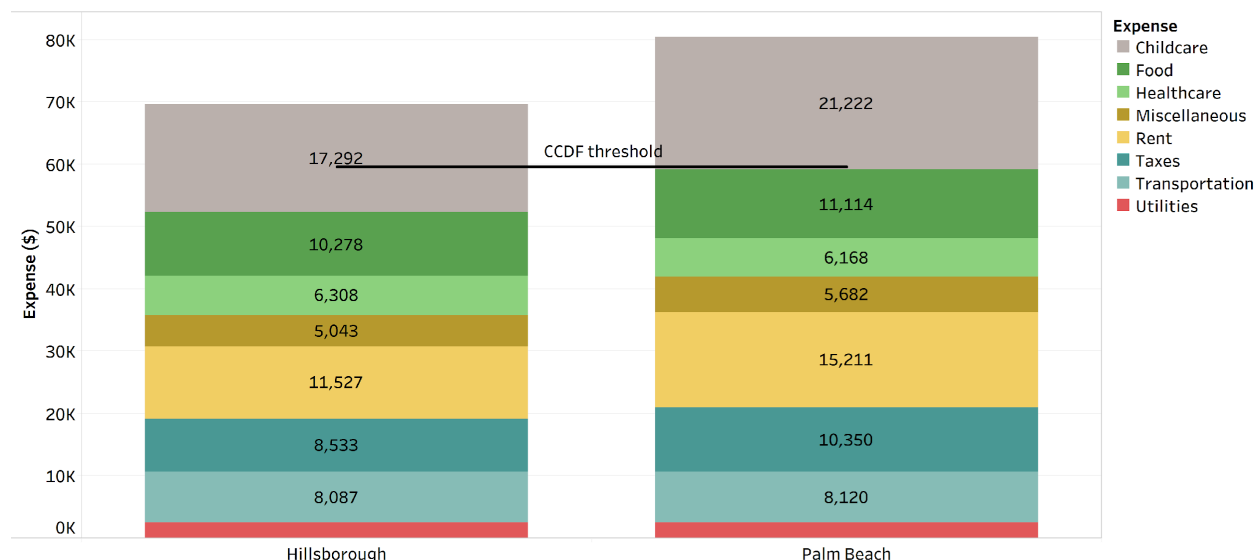

Section II: CCDF in Florida

Case study of two Florida counties

Two counties in the state of Florida were selected to illustrate the limitations of CCDF eligibility thresholds and test the alternatives for a family of two adults and two children. We compare Hillsborough County, which includes all of Tampa city limits and the surrounding area, and Palm Beach County, which includes multiple cities north of Fort Lauderdale and south of Jacksonville. We chose Hillsborough County because the median wage and cost of living are similar to the statewide median and we choose Palm Beach County because it has the second highest living costs in the state, which allow us to demonstrate the extent to which the variation in cost of living across the state can create difficulties for CCDF participants. Palm Beach was chosen over Monroe (the most expensive county) due to the latter's low population, which creates greater potential for measurement error in expense and income data.

Figure 4 shows the expenses that comprise the standard for a family of four in these two counties. In Hillsborough County, the standard is \$69,600, which is similar to the population weighted average of the state, \$70,400. This amount is \$10,000 above the 85 percent SMI exit threshold for CCDF. This implies that, for the average cost of living county in the state of Florida, the current CCDF exit threshold does not permit a smooth transition to self-sufficiency. Families that lose CCDF in Hillsborough County may not be able to afford quality childcare without making cuts elsewhere in the budget. This issue is even more pronounced in high-cost counties. For example, Palm Beach County has one of the highest costs of living in the state and therefore one of the largest gaps between the CCDF income eligibility threshold and the standard for a family of four. The same family living in Palm Beach would need to make \$80,400 to achieve the standard. It would be difficult for the family to pay childcare costs for two young children without major sacrifices to other necessities or a large amount of other government support (on the order of \$21,000 per year). However, if the family were earning income at or above the CCDF threshold of \$59,580, they would not qualify for most of the public assistance programs such as Supplemental Nutrition Assistance Program (SNAP), Earned Income Tax Credit (EITC), and Medicaid (see Appendix B for details).

Figure 4: The Standard and Its Composition in Hillsborough and Palm Beach Counties

Note: Assumes family of two adults and two children, aged two and three. The cost of living in Hillsborough County is similar to the average cost of living across the entire state of Florida.

Sources: University of Washington, U.S. Census Bureau, and authors' calculations

Thus, setting CCDF income eligibility limit at the 85 percent of SMI imposes significant financial constraint on many families, particularly those in high-cost counties.

Co-pay structure

As shown in Figure 4, total childcare costs for two children aged two and three is roughly \$17,300 in Hillsborough County and \$21,200 in Palm Beach County. Families receiving CCDF assistance pay only a portion of this cost, as determined by the co-pay schedule.

Figure 5 illustrates the existing co-pay structure in both counties. It shows how annual out-of-pocket childcare costs increase gradually with income up to the point where the CCDF subsidy is lost entirely.¹⁴ At 85 percent of SMI, a family is no longer eligible for CCDF and must pay the full cost of childcare. Due to the large difference between the size of the final co-pay and the full cost of childcare, the financial loss to the family whose income crosses the eligibility threshold is substantial. Families whose income exceeds 85 percent SMI by \$1 face a benefits cliff amounting to \$13,000 in Hillsborough and \$16,000 in Palm Beach. Therefore, the family might choose not to advance in their career to keep their income deliberately below

¹⁴ To calculate the annual out-of-pocket childcare costs when receiving CCDF subsidies, we make assumptions about the number of days the child needs full-time and part-time care over the course of the year. We assume that both children need full-time care for 260 workdays per year (365 days minus weekends and holidays).

the threshold to avoid this large financial loss. This creates a dilemma for working parents who must choose between long-term career and financial success and the immediate needs and best interests of their children.

Figure 5: Existing CCDF Co-Pay Schedule in Hillsborough and Palm Beach Counties

Note: Assumes family of two adults and two children, aged two and three.
 Sources: University of Washington, Policy Rules Database, and authors' calculations

Section III: Alternative Co-Pay Schedules

As we discussed previously, two problems with the existing CCDF design are: 1) families' inability to afford unsubsidized childcare without the need to forgo other basic needs, especially in high-cost areas (affordability problem); and 2) the abrupt loss of subsidy at the eligibility threshold that results in a significant loss of household's financial resources (benefits cliff). In this section, we demonstrate two alternatives to the existing CCDF co-pay schedule and exit eligibility threshold that address these problems. The first alternative addresses the affordability issue. The second alternative addresses both the affordability and the benefits cliff issues. We intentionally do not demonstrate a solution, addressing only the benefits cliff problem because such a solution implies using the current exit eligibility threshold, and thus would create a sharp increase in co-pays for households currently near the exit eligibility threshold relative to the current co-pay schedule.

Option 1: Addressing Affordability: The Extended Co-Pay Schedule

The first option extends the eligibility for the CCDF subsidy above 85 percent of SMI and allows families to continue receiving the subsidy as long as their income is below the standard for their family size. The co-pay schedule for families whose eligibility is extended is determined by linearly extrapolating the current co-pay schedule to the new standard-based eligibility threshold. The current co-pay schedule is determined separately by each county in Florida, but all have the following structure. As income increases, a family's co-pay also increases. All counties have 17 income brackets (with the same range of income across all counties) for determining the co-pay. However, the co-pay level for each income bracket varies by county. For example, the highest full-time co-pay for daily care is \$10.20 in Hillsborough and \$14.60 in Palm Beach. To extend the current structure of 17 income brackets to the new eligibility limit would require adding a different number of additional income brackets depending on the county. In Palm Beach County, this would effectively add nine additional co-pay levels. In Hillsborough County, where the standard is closer to the current threshold of 85 percent of SMI, only four additional co-pay levels would be needed.

Figure 6 illustrates how this option works if implemented in Palm Beach and Hillsborough counties. In both counties, the new eligibility threshold is higher than 85 percent of SMI. The threshold is higher in Palm Beach County, which has a relatively higher cost of living. Setting adjusted CCDF eligibility thresholds at the standard implies that families' income at the threshold allows them to afford the full price of childcare without needing to sacrifice other basic needs. It addresses the first problem with the existing CCDF co-pay schedule.

Figure 6: Illustrating Option 1, Extended Current Co-Pay

Note: Assumes family of two adults and two children, aged two and three.
 Sources: University of Washington, Policy Rules Database, and authors' calculations

However, this extended co-pay schedule still results in a benefits cliff at the threshold because there is not a smooth transition between the co-pay and the full amount of childcare at the adjusted CCDF threshold. Even at the standard, the family faces a benefits cliff. The size of the cliff in Hillsborough County at the revised eligibility threshold is \$12,651 compared to \$13,314 with the current co-pay schedule. In Palm Beach County, the size of the cliff would change to \$12,330 compared to \$15,840. Thus, with this design, families still face an incentive to keep their income below the exit income eligibility threshold.

Option 2: Addressing Affordability and the Benefits Cliff: The Alternative Co-Pay Schedule

A second option is to eliminate the benefits cliff by changing the co-payment so it's an increasing fraction of the full unsubsidized childcare costs, in addition to extending benefits to families with income below the standard. In this model, the higher the family income, the higher the share of childcare costs they would pay. Families would assume the full costs of childcare once they reach the standard eligibility threshold. This is done by making the share of the full childcare cost paid by the family to be a continuous function of income that is equal to one at the threshold. Like option 1, the eligibility threshold is set at the value of the standard to provide greater assurances that the family can afford to pay the full cost of childcare without sacrificing other basic needs. In combination, these changes would allow for a smooth

transition toward paying the full cost of childcare.¹⁵ Mathematically, the structure of the alternative co-pay takes the following form:

$$\text{copay}_{fc} = \left(\frac{\text{Income}}{\text{The standard}_{fc}} \right)^k \times \text{Total Childcare Costs}_{fc} \quad (1)$$

where *Income* is the total countable family’s income, *The standard_{fc}* is the value of the standard, and *Total Childcare Costs_{fc}* are the total unsubsidized costs of childcare that a family would have to pay.¹⁶ Both the value of the standard and the total unsubsidized costs of childcare vary by family type *f* (age and number of children) and by county of residence *c*. By design, when a family's income reaches the income eligibility threshold (at the standard), the family’s co-pay is equal to the total childcare costs. The adjustable parameter *k*—discussed in the next section—will determine the shape of the co-pay schedule. A higher value of *k* will coincide with a lower co-pay schedule for all families. However, the higher the *k*-value, the more quickly the co-pay increases as income approaches the eligibility threshold.

Figure 7 demonstrates the alternative co-pay if implemented in Palm Beach and Hillsborough counties. As in Figure 6, in both counties, the new eligibility threshold is higher than 85 percent of SMI and the threshold is higher in Palm Beach County, which has a

¹⁵ Some states have a similar co-pay strategy. For example, in Idaho, co-payments are based on the price of care, with families in different income ranges paying different percentages of the price. Although the Idaho co-pay schedule eliminates the CCDF benefits cliff, it does not address the problem of affordability of childcare for families at the threshold and higher (Minton and Durham, 2013).

¹⁶ According to Florida’s Child Care and Development Fund Plan for FFY 2019–21, the definition of countable income for determining eligibility in Florida is “combined gross income, whether earned or unearned, that is derived from any source by all family or household members who are 18 years of age or older who are currently residing together in the same dwelling unit. The term does not include income earned by a currently enrolled high school student who, since attaining the age of 18 years, or a student with a disability who, since attaining the age of 22 years, has not terminated school enrollment or received a high school diploma, high school equivalency diploma, special diploma or certificate of high school completion. Income does not include income earned by a teen parent residing in the same residence as a separate family, nor does income include food stamps, adoption subsidies, foster care payments, documented child support and alimony payments paid out of the home, federal nutrition programs, federal tax credits, state/territory tax credits, housing allotments, LIHEAP or energy assistance, military housing or other allotment/bonuses, federal housing assistance payments issued directly to a landlord or the associated utilities expense, scholarships, education loans, grants, income from work study, disaster relief or other forms of temporary assistance of families in a natural disaster areas, income of foster parents and court ordered relative and non-relative caregivers, independent living grant, lump sum settlement, money borrowed with an established repayment plan, one time only gifts, sale of personal assets, VISTA payments, Supplemental Security Income (excluded for children only)” (Office of Early Learning, 2019).

relatively higher cost of living. Additionally, a smooth co-pay schedule ensures that there are no benefits cliff at the eligibility threshold.

Figure 7: Illustrating Option 2, Extended Alternative Co-Pay

Note: Family of two adults and two children, aged two and three. The *k*-parameter is set to 3.
Sources: University of Washington, Policy Rules Database, and authors’ calculations

We make a couple of additional observations. Computing this eligibility threshold by family type and county will require some different steps from the previously discussed method. This new eligibility threshold and corresponding total co-pay will vary by county since the costs of living (and the standard) vary within a state. Second, the new eligibility threshold will vary depending on the family composition: number of adults, number of children, and ages of children, because these characteristics of the family affect the total living costs and total childcare costs. The current eligibility threshold only varies by SMI and family size. These costs could be approximated using the same source we used, the standard. Alternatively, sources such as the United Way’s ALICE threshold, the Atlanta Fed’s Cost-of-Living Database, or other cost of living measures that consider detailed basic expenses at fine geographic levels such as county or metropolitan area can be used.¹⁷

Further, in some cases, the resulting alternative eligibility threshold will be below that of the existing 85 percent of SMI eligibility threshold. Families that live in areas with lower living costs may have a lower standard. Given that the standard reflects the minimum income

¹⁷ The United Way’s ALICE data is available at <https://www.unitedforalice.org/> and the Atlanta Fed’s Cost of Living Database is available at <https://www.atlantafed.org/economic-mobility-and-resilience/advancing-careers-for-low-income-families/policy-rules-database.aspx>.

needed to cover basic household expenses and support economic self-sufficiency, we suggest that the alternate eligibility threshold be either the standard or 85 percent of SMI, whichever is greater. This ensures that in the short term, no family that is already on the program would be forced out of it.

The choice of the *k*-parameter

In equation 1, parameter *k* determines how gradually co-pay changes with increase in income. To illustrate how different *k*-parameters affect families' out-of-pocket expenses relative to the original co-pay schedule, let's consider the family of four living in Palm Beach County. Figure 8 plots the original co-pay and alternative co-pay schedules for three different values of *k*-parameter (*k*=2,3,4). For *k*=4, in comparison to the extended co-pay, the alternative co-pay makes almost all families better off. The out-of-pocket expenses for families with income below 85 percent of SMI is less than their current out-of-pocket expenses. For *k*=3, families with income below \$40,000 are better off while families with income above \$40,000 would pay higher co-pays. Finally, when *k*=2, almost all families except very low income below \$15,000 face higher out-of-pocket expenses.

Figure 8: Alternating *K*-Parameter—Costs to Families at Different Income Levels in Palm Beach County

Note: Family of two adults and two children aged two and three.

Sources: University of Washington, Policy Rules Database, and authors' calculations

The choice of k-parameter additionally affects the total government spending on subsidies to participating families. Families that start paying higher co-pays relative to the current co-pay schedule reduce government costs while families that start paying lower co-pays increase government costs. The sum of the differences in co-pays across all families ultimately determines the change in government spending for this program. Next, we discuss the implications of the choice of the k-parameter to the total government spending.

Section IV: Alternative Co-Pay Schedules and Costs Implications

CCDF is jointly financed by federal and state governments and consists of three funding streams: mandatory, matching, and discretionary funds. In FY 2018, the total CCDF allocation across all U.S. states was \$10.2 billion (Office of Child Care, 2018).¹⁸ Of this, \$6.9 billion was directly spent on subsidies. In Florida, direct spending was \$422 million in FY 2018 (Office of Child Care, 2020). The block-grant nature of the CCDF subsidy and the current level of funding is insufficient to pay for all who are eligible. Thus, this funding design significantly limits participation among the eligible population. In 2012, only an estimated 15 percent of the estimated 14.2 million children who were eligible for CCDF received subsidies (Chien, 2015). Given that CCDF funds are limited by the amount of the block grant, it is important to provide estimates of how each of the proposed alternatives will affect public spending and the number of families served by the subsidy. Implicitly, the additional cost imposed by our proposed changes to the CCDF program would need to be financed somehow, such as by federal, state, or community funding, or by philanthropic dollars. If the amount of spending on the program does not increase to pay for the proposed changes, these changes would reprioritize funding for those currently enrolled in the CCDF program. Funding would be reprioritized because these proposed changes permit families to stay on CCDF at higher incomes. Thus, the changes would reduce the availability for those coming into the program at lower-income levels compared to the current design.

In the next section, we evaluate the effect of each of the proposed CCDF co-pay structures on the costs to the government as well as to the individual families. This allows us to discuss how alternative CCDF co-pay schedules will have differential effects on families at different parts of the income distribution.

¹⁸ The total spending is the sum of federal and state spending (state mandatory allocation, state share matching funds, and federal-only funds).

Comparing original, extended, and alternative co-pays

Methodology

We estimate government spending and average costs to participating Florida families for each income bracket in the following steps. First, we calculate unsubsidized childcare costs for all Florida households in the 2018 American Community Survey (ACS) using the standard. The total cost of childcare for each family is determined by taking the number of children in the family and multiplying by the age-specific cost of childcare provided in the standard.¹⁹ Second, for each Florida family in the ACS we calculate the total family co-pay under CCDF rules. Third, we compute the average childcare costs and average co-pay per family in each income bracket. Fourth, we multiply the average childcare costs for families in each of 17 existing income brackets and a proposed new one by the number of families served, using administrative data provided by the Florida Department of Education Office of Early Learning. This gives us the total unsubsidized childcare costs by income bracket.

To understand potentially how many participating families would be affected by extending the income eligibility limits (and thus, what the costs to the government would be), we need to know how many newly eligible families with income between 85 percent of SMI and the new income threshold would likely take up CCDF. To calculate this number, we extrapolate the CCDF take-up rate to the additional 18th income bracket (between 85 percent of SMI and the standard) by using the same take-up rate as the 17th income bracket, or 6 percent.

It is important to note that the proposed alternative affects only the exit eligibility threshold for CCDF. As we noted previously, there are two eligibility thresholds in Florida: initial eligibility and exit eligibility. The initial enrollment (“entry”) threshold remains at 150 percent of FPL, which is below the exit threshold of 85 percent of SMI. Thus, to obtain an estimate for how many families would potentially fall into the 18th income group we cannot rely on population estimates—families must advance to the next income group from a lower-income group. Therefore, we make an assumption for how many families move to income bracket 18 from lower-income brackets. Because we do not know how many families currently on CCDF would potentially increase their income to be within income bracket 18, we provide a range of cost estimates to the government based on different assumptions of how many families would move to income bracket 18. The lower bound of the range assumes that all 1,544 families from income bracket 17 (with income between 230 percent of FPL and 85

¹⁹ We assume that families do not need the center-based summer care for their children and rely on alternate sources for childcare.

percent of SMI) advance to the next income bracket. The upper bound of the range assumes that all families from income brackets 15 to 17 (3,798 families) progress to income bracket 18. These estimates can be interpreted as an upward bound that, if accurate, would take time to realize.²⁰

Results

Table 1 shows the results of the extrapolation exercise and the costs implications for three different co-pay schedules: the current co-pay schedule, the extended co-pay schedule, and the alternative co-pay schedule where the k-parameter in equation 1 is set to 3. We choose to show the k=3 scenario, because as will be discussed later, of the three k-parameters considered, this parameter choice minimizes costs to the government without significantly affecting families' budgets. The table features 18 total income groups: the first 17 groups have income below the current exit eligibility threshold and the 18th income group includes the hypothetical newly eligible families whose income increases from below 85 percent SMI to between 85 percent of SMI and the standard. For each income bracket, the table shows the estimated number of families receiving a CCDF subsidy, the average annual co-pays for three different co-pay alternatives, and the direct costs of the subsidy to the government.²¹

By design, the extended co-pay model does not change the family's portion of childcare costs except for those in income bracket 18. In contrast, the alternative co-pay (k=3) changes the co-pay schedule for all income groups. Families in income brackets 1 to 14 pay less, while families in income brackets 15 to 17 pay more compared to the original co-pay schedule. Families in income bracket 18 are now covered by the subsidy and thus will pay less.

Under both the extended co-pay schedule and the alternative co-pay (k=3) the costs to the government are estimated to increase. With the extended co-pay, depending on the assumption of the new number of families served, costs are estimated to increase between \$4.4 million to \$10.6 million (1.0 percent to 2.1 percent) due to an increase in the number of eligible families. For the alternative co-pay schedule with k=3, the program costs would increase by \$37.0 million to \$40.4 million (7.2 percent to -7.8 percent). This reflects a

²⁰ Families that move from income bracket 17 to 18 would experience an average income increase of 6 percent. Families that move from income bracket 15 to 18 would experience an average income increase of 18 percent. In calculating the additional costs imposed, we assume that all those who moved to income bracket 18 from these lower brackets are replaced by families on wait lists and that CCDF participants move to higher-income thresholds such that the initial distribution of CCDF participants for all income groups below income bracket 18 is retained.

²¹ To determine the income group specific co-pay amount we use the average co-pay amount for the income group across all counties in the state (recall that each county has their own unique co-pay amounts but the same income categories).

combination of a decrease in program costs on families that face higher co-pays and an increase in program costs on those families that face lower co-pays relative to the original co-pay schedule.

*The number of families receiving CCDF in income group 18 is 0 for the current co-pay schedule. Under the extended and alternative co-pay schedules, this would increase to a range of 1,544 to 3,798.

Calibrating the alternative co-pay schedule

As discussed in Section III, the k-parameter of the alternative extended co-pay schedule in equation 1 can be adjusted to alter effects on the total government spending and costs to individual families.

Table 2 shows the average costs to the family at each income level and the total government spending under each alternative: the current co-pay and three alternative co-pays (k=2, k=3, and k=4). As the table demonstrates, k=2 results in savings to the government. The estimated total cost of the program relative to the current co-pay schedule is estimated to decline by a range of \$3.2 million to \$5.6 million. It comes at a trade-off. With k=2, all eligible families that fall into income brackets four or higher (corresponding to income above 100 percent of FPL and below 85 percent of SMI) would pay higher co-pays. In contrast, if k=4, then families at almost all income levels pay lower out-of-pocket expenses compared to the current co-pay schedule. For example, a family in the 150 percent to 155.83 percent of FPL (income bracket 7) currently pays, on average, \$1,509 per year in co-pays. If it were k=2 instead, their average annual co-pay would increase to \$2,063, but with k=4 the average co-pay would decrease to \$688 per year. However, k=4 is the most expensive alternative; the total government costs are estimated to be \$56.8 million to \$61.2 million larger than the current co-pay, which equates to 11.0 percent and 11.9 percent increase in spending, respectively.

Table 2: Adjusting K-Parameter—Average Costs to Individual Families and Total Costs to the Government: Simulated FY 2020

Section V: Discussion and Conclusion

High-quality childcare is unaffordable for more than half of parents in the United States. Government subsidizes the cost of childcare for working parents directly through the Child Care and Development Fund. However, the continuing eligibility requirements of the CCDF subsidy program pose challenges to economic self-sufficiency. The termination of a subsidy often occurs before families can afford the full cost of childcare, placing families in precarious financial situations. This can become a disincentive for career advancement, which runs contrary to the purpose of the program. This disincentive can result in families having to choose between high-quality childcare and employment. In response, a working adult may opt out of the labor force, choose not to advance credentials that would lead to higher-wage positions, or turn down promotions because it is not in their family's financial or practical best interest to do so. The problem of finding affordable childcare has only been exacerbated by the recent COVID-19 pandemic. Government-mandated business shutdowns and social distancing measures led to a huge negative supply shock of childcare providers in the country, and the loss of revenues will likely result in many childcare facilities closing their doors permanently.

In this paper, we illustrate two problems with the CCDF program using the case study of Florida—affordability and the benefits cliff. The CCDF program rules allow the exit income threshold to be set at no higher than 85 percent of SMI. In this analysis, we argue that this threshold is too low for most families and that it should instead be set according to families' ability to afford a set of basic expenses. We find that only 3 percent of Florida's population live in counties where a family with two adults and two young children can afford the full cost of childcare at 85 percent of SMI without sacrificing other basic needs. Furthermore, the distance between the current eligibility threshold and the amount needed to afford a basic set of expenses varies extensively by county. The average estimated disparity between the 85 percent SMI eligibility threshold and the amount of additional income needed to afford all expenses is \$11,000 across all counties for such families; the maximum difference for an individual county is \$28,000. These numbers reinforce the need for states to be able to adjust eligibility thresholds according to the cost of living in different areas.

The second problem we address is the benefits cliff. The CCDF program in Florida lacks a smooth phaseout schedule, which creates benefits cliffs for some families. For example, a family of four with two young children that crosses the income eligibility threshold stands to lose \$16,000 in Palm Beach County, one of the most expensive counties in Florida, due to an abrupt loss of the subsidy.

To address these issues, we propose two alternatives co-pay schedules for the CCDF program in Florida. Our first proposed alternative addresses the affordability issue by extending the eligibility threshold to the level of income at which a family can afford paying for childcare without decreasing the basic standard of living. The costs for a basic standard of living vary at the county level. In the rare case that the alternative threshold is below the current threshold, we suggest maintaining the current threshold so that no families are made worse off. The first proposed alternative extrapolates the current co-pay schedule of the CCDF program in Florida to this new eligibility threshold. This extends eligibility to those near the current income limit without affecting any other families in the program. We estimate that between 1,544 and 3,798 additional families could be helped under this alternative. The upward bound on the estimated annual additional cost of this change is between \$4.4 million to \$10.6 million (1.0 percent to 2.1 percent).

The second proposed alternative addresses both the affordability problem and the cliffs effect problem. It features a co-pay schedule that is different from the current co-pay schedule across the entire income distribution and features a smooth subsidy phaseout schedule. This eliminates the CCDF benefits cliff entirely. In our model, parameter k controls the degree with which co-pay increases with income. We show how parameter k can be calibrated to minimize direct costs to the government. Although costs to the government can be decreased by setting parameter k to 2, we suggest setting the phaseout k -parameter to 3. This parameter choice would leave almost all families better off at relatively low additional costs to the government.

The additional costs incurred by either alternative are not without significant potential reward. Studies have found that investments in childhood development significantly increase cognitive development and earnings potential as adults. Thus, such investments will likely result in better long-term outcomes for these children. Moreover, smoothing the CCDF benefits cliff can potentially increase the economic mobility of low- or moderate-income families for whom childcare is unaffordable. Increased income among parents and increasing income among low-income children as adults would create long-run returns to the government in the form of reduced government assistance, higher income tax, and higher sales taxes.

Appendix B: Eligibility for Major Public Assistance Programs and Tax Credits

In this appendix we first discuss all public assistance programs for which the hypothetical family with two adults and two children would be eligible in Palm Beach County, Florida, at different income levels. We then isolate childcare-related programs and discuss how they can come together to help families afford quality childcare. The graphs here do not include living costs, however. Despite the assistance from the government, families can still face financial hardship depending on their overall expenses.

All major public assistance programs and tax credits

Appendix Figure 1 shows what public assistance programs and tax credits a family with two adults and two children can receive at different income levels and how the value of assistance changes with income. At a very low-income level, a family is eligible for the subsidized health insurance through Medicaid, housing assistance through the Housing Choice Voucher (Section 8), food assistance through SNAP, energy assistance through the Low-Income Energy Assistance Program (LIHEAP), and childcare assistance through the CCDF subsidy.

All public assistance programs phase out when income increases. Florida is a state that did not expand Medicaid eligibility under the 2014 Affordable Care Act. Therefore, parents lose access to Medicaid once their income reaches \$8,032 (32 percent of the federal poverty level for the family of four) and they fall in the so-called Medicaid coverage gap. Parents gain subsidized health insurance through the Marketplace (ACA subsidies) once their income reaches \$26,200 (100 percent of the federal poverty level for the family of four).

A number of federal tax credits are available for the family. The Earned Income Tax Credit is refundable, meaning that families can claim it even if they do not pay federal income tax. A small portion of the Child Tax Credit is refundable and therefore available for low-income families. However, in order to claim full credit, families must have a federal tax liability that exceeds the size of the credit. Child and Dependent Care Tax Credit (CDCTC) allows families to deduct certain childcare-related expenses while calculating their tax liabilities. However, federal CDCTC is nonrefundable credit and therefore not available for low-income families that do not have federal tax liabilities.

Appendix Figure 1: Public Assistance Programs and Tax Credits by Employment Income

Note: Family of four in Palm Beach County, Florida, with children aged two and three.
 Source: Policy Rules Database (Ilin and Terry, 2021)

At the eligibility threshold for CCDF (85 percent of SMI), families are ineligible for most major public assistance programs (Housing Voucher, SNAP, Medicaid for adults and children) and for EITC. Families are still eligible for the ACA subsidy and can claim the Child Tax Credit and Child and Dependent Care Tax Credit.

Childcare-related public assistance programs and tax credits

Appendix Figure 2 isolates public assistance programs and tax credits that are targeted specifically for working families that need childcare for their children.

Tax Credits

The two federal tax credits aimed specifically at families with children are the Child Tax Credit (CTC) and Child and Dependent Care Tax Credit (CDCTC). Prior to the recently passed American Rescue Plan Act of 2021 (APRA), the federal CTC eligibility rules were the following. Up to \$2,000 per child under age 17 can be claimed for up to two children; if the credit

exceeded taxes owed, families still may receive up to \$1,400 per child as a refund. Income had to be above \$25,000 and below \$280,000 for single parents and \$480,000 for married couples, after which the tax credit began to phase out by 5 percent. These 2020 rules are depicted in the graph below. Families with working adults may be able to get back some of the money they spent on childcare expenses by claiming CDCTC. The credit is 20–35 percent of qualified expenses, and the exact percentage depends on the adjusted gross income. The maximum amount of qualified expenses a family can claim is \$3,000 for one qualifying child and \$6,000 for two or more.

A limitation of the CDCTC is that it is nonrefundable. Thus, it is only available to families who owe taxes. Therefore, while the CDCTC provides a higher tax credit to lower-income taxpayers, many low-income taxpayers do not have tax liabilities and therefore receive little or none of the tax credit. Both tax credits also exist in slightly different forms in many states that have state income tax. A strength of the CDCTC is that, unlike CCDF subsidies, tax credits are part of the tax code and thus are available to all who qualify.

Appendix Figure 2: Head Start, CCDF Subsidy, and Tax Credits by Employment Income

Note: Family of four in Palm Beach County, Florida, with children aged two and three. Rules are as of 2020.

Source: Policy Rules Database (Ilin & Terry, 2021)

Appendix Figure 2 also shows how the value of tax credits changes as income increases. First, families with income below \$2,500 are ineligible for CTC. Second, because

only \$1,400 out of the \$2,000 maximum per child is refundable, the value of the CTC gets larger as income increases up until it reaches \$2,000 per child (\$4,000 in total for the hypothetical family shown). The CDCTC is not refundable at all. Therefore, the gray area on Appendix Figure 2 appears at the point when the family begins to pay federal income tax, at approximately \$30,000. The share of qualifying care expenses for the CDCTC declines with income gains, which results in a small change in the value of CDCTC with income gains for this family.

Head Start

In addition to the CCDF subsidies, Head Start is another federal program that helps working parents who need childcare. Head Start is a program administered by the U.S. Department of Health and Human Services and provides free early childhood education to low-income children and families. Families must have income below 100 percent of the federal poverty level in order to qualify for the program. Head Start (and Early Head Start) are available for children under the age of five. Appendix Figure 2 shows the value of Head Start for our hypothetical family with two children aged two and three if their income is below the eligibility threshold. If the family is above the threshold for Head Start, the chart shows the value of the CCDF subsidies. Compared to Head Start, which is a free program, parents must pay a co-pay if they participate in the CCDF subsidy. Therefore, the total value of a subsidy declines when the family switches from the Head Start to CCDF program.

Appendix C: SMI Versus the Standard across the United States

Appendix Figure 3 shows the average standard minus the exit eligibility threshold of 85 percent SMI for a family of two adults and two children aged two and three across the United States. In North Dakota, the standard is \$11,382 lower on average than 85 percent of SMI whereas in California, the average standard is \$25,673 higher than 85 percent of SMI.

Appendix Figure 3: The Standard Minus 85 Percent SMI

<u>Executive Summary</u>	3
<u>Leap Fund Calculator Pilot</u>	8
<u>Coaching during the time of COVID</u>	27
<u>The Updated Leap Fund Program</u>	51

Executive Summary

What a benefits cliff is

People face a benefits cliff when they receive public benefits from the government, earn a raise, and then discover that they make too much money to receive the benefits. But they are not making enough money to sustain themselves and their household.

Leap Fund exists to find, bridge, and eliminate benefits cliffs, and create a path towards self-sufficiency and financial independence.

Learnings from Leap Fund's pilot

Leap Fund's calculator, designed with clients and coaches, reflects how changes in income, hours, or household size may impact benefits eligibility. We recruited 10 coaching organizations, including financial, employment, workforce development training coaches; social workers, and case managers to participate in Leap Fund's Benefits Cliff Calculator Pilot.

Leap Fund's key learnings included:

- Close to 50% of clients were aware of benefits cliffs, and 1 out of 4 clients made decisions out of fear of hitting them
- Leap Fund's Calculator program adds minimal time to coaching sessions, with some unanticipated additional use cases
- Overall, the pilot was well-received, with multiple impacts on client decision making

Insights on how coaching has changed during COVID-19

During the pilot, we realized that we were witnessing a change rippling across coaching organizations, and that we had a front row seat to it all. Here are the key insights we found, about the ways that coaching has changed during COVID-19.

New fears for clients

- reactive triage sessions, not long term planning
- unemployment a top concern

Time spent differently

- time is now spent on different tasks
- conversations are shorter, tech takes longer
- people are lonely and scared

The new tech world

- orgs needed to implement new digital tools quickly
- building trust virtually is hard, but possible
- privacy is a struggle
- technology is a challenge on multiple fronts

The future of coaching

- working remotely has positives
- new clients are emerging
- new ways of working are being testing right now

Leap Fund's new Calculator Program

Leap Fund's Calculator Program enables coaches to meet the moment with clients:

01	Nationwide reach	<ul style="list-style-type: none">• Predict benefits cliffs
02	Up-to-date information	<ul style="list-style-type: none">• Surface benefits eligibility
03	Improve conversation quality	<ul style="list-style-type: none">• Remove stigma and anxiety
04	Deeper impact	<ul style="list-style-type: none">• Plan for changes before they happen

Learn more about how you can incorporate Leap Fund into your existing coaching services, to help your coaches create meaningful touchpoints, and deeper impact, with clients. Find us at myleapfund.com or email us directly info@myleapfund.com

Learnings

Leap Fund Calculator Pilot

Who we are

People face a benefits cliff when they receive public benefits from the government, earn a raise, and then discover that they make too much money to receive the benefits. But they are not making enough money to sustain themselves and their household. Leap Fund exists to find, bridge, and eliminate benefits cliffs, and create a path towards self-sufficiency and financial independence.

Leap Fund's calculator, designed with clients and coaches, reflects how changes in income, hours, or household size may impact benefits eligibility.

Leap Fund's calculator pilot program included onboarding, resources, guides, and scripts. Our goal was to collect data and feedback on benefits, benefits cliffs, and client impact. Leap Fund collected feedback via surveys, 1:1 interviews, feedback forms, and email. The pilot program took place over 4 week sprints between March - August 2020, with the option to renew after each sprint ended. During the pilot, coaches used the calculator with clients that were benefits recipients, or potentially eligible for benefits.

Who participated

Nationwide

Cara, Chicago

Catalyst Miami

Circles: Davis County, Green Bay

**Episcopal Community Services,
Philadelphia**

**The Directors Council: Evelyn K. Davis
Center for Working Families, Financial
Empowerment Center @ EKD, Oakridge
Neighborhood Services, Des Moines**

NYC-specific

CUNY Hollis Gardens

**Neighborhood Trust
Financial Partners**

**New York Legal
Assistance Group**

Per Scholas

The HOPE Program

Who participated by role

Onboarding experience

Our 2-½ hour onboarding process, spread across 4-10 days (based on partner needs), included a live webinar, a guidebook, coach testing period, and a pre-client Q&A session.

70%

reported the onboarding being really helpful

74%

reported it was important to have a testing period with the calculator

61%

reported the guidebook being really helpful

“I thought onboarding was really thorough, and that we really got the tool by the end of the experience. My team members were really prepared to use the tool.”

Calculator use across the cohort

We trained **77 coaches and supervisors** to use the calculator.

Coaches had 3,682 client sessions, and spoke about benefits, benefits cliffs or used calculator with 156 of them (4.2%). Coaches used the calculator with 90 clients (2.4%).

Cohort client trends with calculator use:

- 46% of clients had children in their household, 75% of which were single parents
- 82% of clients already received benefits
- 46% were not employed, but only 13% were receiving unemployment
- 64% of clients were female
- Less than 6% had healthcare subsidized by employer

Benefits cliff understanding

Coaches asked clients about their understanding of the concept of benefits cliffs, and whether they had made decisions based on the fear of hitting a benefits cliff.

Close to 50% of clients were aware of benefits cliffs, and 1 out of 4 clients made decisions out of fear of hitting them.

Calculator time in sessions

One of the concerns we heard partners express at the outset was that the calculator would add too much time to sessions. What we learned is that **Leap Fund only adds between 10-15 minutes to sessions for 80% of coaches.**

Coaches have reported spending hours searching for benefits regulations and running their own calculations. Overall, Leap Fund saves time in sessions.

“I view myself as tech savvy, and would look on Google to find benefits regulations, but would end up doing the math myself. I haven't seen any cliff calculator like this.”

Calculator use impacted client decision-making

Most commonly coaches reported using the calculator in the following situations, with outcomes that included:

- **Illuminating benefits cliffs** for a variety of scenarios
- Showing **eligibility for public benefits** like SNAP
- **Removing anxiety and stigma** with data driven output page
- Surfacing **benefits impact of earning more** income
- **Informing job search** parameters
- **Preparing salary negotiation** for raise

“Some people don't want the stigma of being on benefits. But when they see the numbers put in a budget, that's where reality sets in for them and it's a powerful visual.”

Feedback

What partners said

“The Leap Fund Calculator created space for new conversations and insights that can be actionable for my clients.”

“This has been a good tool for ‘what ifs’. Most of the feedback has been around adjusting certain types of income. Like, ‘what if I gain custody of my son?’ With the calculator I can predict and [adjust for that].”

“We felt really alone dealing with these cliffs, and wondered if anyone else knows about this stuff. You’re the first group we’ve worked with that’s acknowledging this and understands it.”

Feedback

**A pandemic is a
difficult time to pilot**

“COVID-19 significantly impacted client finances in loss of wage income, increase in expenses, and benefits they receive. It changed the types of financial counseling services they are seeking.”

“During COVID-19, uncertainty became the focus of sessions. During normal times it would be easier to incorporate the calculator, but now, it’s not as easy to do.”

Key Insights

Coaching during the time of COVID

Insights on how coaching has changed during COVID-19

During the pilot, we realized that we were witnessing major changes rippling across coaching organizations, and that we had a front row seat to it all. Here are the key insights we found, about the ways that coaching has changed during COVID-19.

New fears for clients

- reactive triage sessions, not long term planning
- unemployment a top concern

Time spent differently

- time is now spent on different tasks
- conversations are shorter, tech takes longer
- people are lonely and scared

The new tech world

- orgs needed to implement new digital tools quickly
- building trust virtually is hard, but possible
- privacy is a struggle
- technology is a challenge on multiple fronts

The future of coaching

- working remotely has positives
- new clients are emerging
- new ways of working are being testing right now

**COVID-19 brought new fears
to the forefront for clients**

Insight 1

Clients focused on reactive triage sessions, not long term planning

Top client concerns amidst COVID-19 include:

- **Emergency & direct support, connecting clients to resources:** food, rent, accessing emergency funds, and government benefits like PUA, EBT, stimulus checks, and CARES act.
- **Unemployment:** finding work, filing unemployment claims, and adjusting to reduced work.
- **Children:** navigating remote school with work, supporting children with school, device sharing with children, and hard parenting decisions around childcare and work.

“One of my clients is a mom of three and her childcare shutdown for a while -- does she go to work and bring her child to someone else?

Clients are making these hard parenting decisions, weighing work, childcare, and making the best decision for their family to keep them safe. ”

Insight 2

Unemployment was top concern during COVID-19

Changing circumstances during COVID-19 meant that some clients had lost everything, and were unconcerned about cliffs in the immediate

- Many clients were unemployed, and were therefore not anticipating an increase in income
- Less clients were job searching because they felt safer receiving unemployment benefits, than the risk of what might happen in a new job
- Those who were employed were less likely to be offered a raise

Time spent differently

Insight 3

Time is spent differently now, between coach and client

More work is being done outside sessions for both the client and coach, and there's a lot more back and forth in-between sessions via text and email.

“Instead of one-hour straight, sessions have become ongoing conversations that happen over days.”

Insight 4

Conversations are shorter, but tech eats up session time

Transferring or accessing documents virtually can be time-consuming, and according to some organizations, triple the length of a session.

“Something that would have taken 20 minutes in-person can be an hour and half, because we have to switch to digital files, and train the client to encrypt and send their documents”

“Doing something dynamic and engaging in Zoom can be exhausting, and people check out quickly. Zoom fatigue is real. People are making choices, either spreading things out, or shortening their sessions.”

Insight 5

People are lonely and scared

Especially in the beginning of pandemic, people just needed someone to talk to.

“I can always tell who lives with a lot of people and who doesn’t, because people who are living alone are desperate for small talk. Especially clients who are unemployed, I have biweekly sessions where we can talk about nothing, but it’s a constant for them.”

It's a brave new tech world

Insight 6

Pressure mounted to find and implement digital replacements quickly

Coaching organizations scrambled to adjust to remote environment, and to secure digital replacements for in-person processes.

- Tech limitations and privacy & safety concerns hindered ability to share documents. Most orgs upgraded to e-signature tools to collect consent forms and waivers
- When documents weren't easily shared, coaches struggled to interpret what they couldn't see
- No walk-ins forced some orgs to get creative with publicizing availability and scheduling appointments

“When people get to experience full in-person coaching, it’s almost like going to a spa, it was so intensely powerful, like rocket fuel. Everyone’s being creative and resourceful, but the deep heartfelt bond that can happen is missing.”

Insight 7

Building trust virtually is hard, but achievable

Organizations struggled with the “delicate dance of building rapport.”

- Before COVID-19, in-person ‘water cooler’ moments helped build relationships and trust
- Over the phone, clients may feel less comfortable sharing financial information (esp their 1st time)
- Now, organizations are rethinking touchpoints for clients, like including multi-step communications before the first session, to build trust virtually

“I didn't think we could build community in a digital space, but we found that we have been able to build community online. We were **underestimating ourselves and students ability to adapt.”**

Insight 8

Coaching is now taking place in your home – it's awkward for everyone

Remote sessions opened new privacy concerns as coaches and clients had to share documents and themselves in new ways.

- Clients and coaches struggled with how to safely review and exchange documents
- Many clients struggled to find privacy in their own home to talk to coaches
- For some, Zoom felt like an invasive window into their home, and not all coaches wanted to be sharing their home with clients

Insight 9

Technology is still a challenge on multiple fronts

Technological access and proficiency defined the experience for coaches and clients in a variety of ways.

- **Clients lack access to technology**, especially computers and internet
- **Many clients have access, but in a limited capacity**, for example, sharing devices with other family members and lacking consistent access to high quality broadband
- **There is a learning curve for some clients on how to use the available technology**, and coaches have to dedicate time to teaching digital literacy
- **Most clients are communicating with coaches via their mobiles**, which limits what a coach can accomplish in a session, especially as it restricts a coaches ability to screen share.

“Our organization started with tech recycling, and redistributing computers to low income communities. Seeing that tech is more accessible than ever, we thought that gap had gone away, but in fact, it’s still very prevalent. Our expectation of what people can do virtually is based on our own privilege.”

A new future for coaching

Insight 10

Working remotely has changed how coaching works

Organizations have found many positives to remote coaching, that they hope to incorporate going forward.

- **Coaches' lives are more efficient**, with less travel time and less busy work
- **Clients are learning digital literacy**, an area of increasing importance
- **Organizations are redefining success metrics**, and are finding new ways to monitor progress when they can't rely on "seeing" it happen.
- **Organizations have increased access to policy makers**, who are more willing to engage and work with them and their clients virtually

Insight 11

Virtual coaching opens doors for new types of clients

Remote coaching has opened the doors for a new demographic of people to access services, including:

- **Working folks**, who no longer need to take off work hours to meet in person with coaches
- **Parents, specifically mothers**, who no longer need to rely on childcare to meet with coaches
- Those who **live far away** from the organizations
- **Justice involved population**, who were harder to serve with an in-person model

“We’re taking a big look at what practices we’d like to go back to in-person because there’s a real sense of loss, and what things we’re going to keep remote because efficiencies are so great and delivery is just as good.”

Insight 12

COVID-19 has provided a fertile testing ground for new ways of working

Most organizations expressed using a hybrid remote / in-person model going forward.

Organizations expressed creativity and excitement around the ways to rethink and restructure classes, coaching sessions, recruiting and onboarding, and are in fact testing out these hybrid models on the ground now (it's not just theory!).

“I'm convinced remote service is here to stay.”

The Updated Leap Fund Program

The Calculator Beta Program

Leap Fund's Calculator Program enables coaches to meet the moment with clients:

01	Nationwide reach	<ul style="list-style-type: none">• Predict benefits cliffs
02	Up-to-date information	<ul style="list-style-type: none">• Surface benefits eligibility
03	Improve conversation quality	<ul style="list-style-type: none">• Remove stigma and anxiety
04	Deeper impact	<ul style="list-style-type: none">• Plan for changes before they happen

The Calculator Beta Program

Our calculator works **nationwide**, and is ideal for organizations with **existing coaching programs**.

We partner with:

- **Financial** coaching
- **Employment** coaching
- **Housing** coaching
- **Workforce Development** coaching
- Social Workers
- Case Managers

The Calculator Beta Program

Join our waiting list!

We're currently running the Calculator Program in a closed Beta with ~40 partners. We'll be aiming to invite new partners to the program in late-2021 / early-2022. If you're a coaching organization that would like to discuss joining our program, let us know, and thank you so much for your interest.

Thank You!

U.S. HOUSE OF REPRESENTATIVES
COMMITTEE ON RULES
EST. 1789 | JAMES P. McGOVERN (MA-2), CHAIRMAN

U.S. HOUSE OF REPRESENTATIVES
Committee on Rules

**ROUNDTABLE: “Ending Hunger in America: Food Insecurity
in Rural America”**

December 8, 2021

Testimony: House Rules Committee Roundtable

December 10, 2021

Melissa Sobolik, CEO, Great Plains Food Bank

Thank you Mr. Chairman, Ranking Member Cole, members of the committee and fellow panelists. It is an absolute privilege to be with you today to shed some light on the often hidden issue of rural hunger.

I grew up on a farm outside of the small town, Courtenay, ND. My parents farmed small grains with my uncle and grandpa. I grew up PROUD of my rural, farming background; my family was growing food to feed the world. How could you not be proud of that? Sure, there were hard times...but I never went hungry. Only much later in my life did I find out I received reduced price school lunches.

After graduating, in my small class of 8, I attended Concordia College in Moorhead, MN. Through all 4 years, I worked 1 to 2 jobs. I thought that was normal and that I was a typical, struggling college student.

The first job I sought out was with the college catering department...honestly, because I knew I would get a leftover meal at the end of my shift.

I also had an off campus job and remember how excited I would get when coworkers would bring in baked goods to share, often sticking extras into my bag. In that moment, I never thought of myself as food insecure or hungry – this was just my reality.

Looking back, I see I was really good at hiding it. I never threw away an empty cereal or mac and cheese box. When they were empty, I'd close the boxes back up and put them in my cupboard; so that when family or friends came over and they'd look in my kitchen they wouldn't know that anything was wrong. And I never thought anything was wrong. Eventually at the recommendation of a family member, I applied for and received SNAP benefits.

I haven't shared these personal stories before – they were a moment in my life where I did what I had to do. It was survival, not intentional. It was a temporary situation, not my identity. To this day, call it prairie pride or something else, I never considered myself a food insecure person, even though by definition I was.

And I think that's one of the reasons **hunger hides in plain sight in rural communities**. We are proud. We don't let it define us or beat us. **We grow food to feed the world, so how can we be hungry at the same time?** We have family and friends and neighbors who will help pick us up when we need it most.

That's what I see and hear from those that I have the honor to serve in my role as CEO of the Great Plains Food Bank.

We are the only food bank in the entire state of North Dakota and Clay County, Minnesota. In our 38 years, we have recovered surplus that would otherwise go to waste and got it into the hands of those who need it through a network of charitable feeding programs and direct service programs.

Pre COVID, we served 102,000 people with 12.7 million meals. In 2020, we served 50% more people, a record of 153,495 individuals, that's 1 in 6 North Dakotans who needed food assistance; half of them being children and seniors.

COVID had detrimental impacts on rural economies. In many small towns, there are only a handful of businesses...so if your hours got cut or you lost your job...there simply wasn't anywhere else for you to go. Or, if one person had COVID, the entire staff was quarantined. Which may have meant that the only grocery store for 60 miles was closed. And because rural communities are so close, they go to the same school, church, post office, when COVID hit one person in the community – it affected the entire town.

We at the Great Plains Food Bank operate under the philosophy that there is “no one-size-fits-all approach” to ending hunger. What works in urban areas may not work in rural or remote areas. We had to get creative delivering services and food during COVID.

We operated drive-through, contactless, mobile food pantries, we put food pantries in clinics or schools – sometimes the only infrastructure in the communities, we are piloting mailing food boxes to homebound veterans and working with our Native Nations to get culturally appropriate foods and services to them.

We are focused not only on ending hunger today, but **ENDING HUNGER TOMORROW** by addressing root causes of hunger and **ENDING HUNGER FOR GOOD** by building a future where hunger doesn't exist.

But we can't do this work alone, it takes government, public and private entities standing beside each other and working **TOGETHER** to end hunger.

Thank you.

**Written Testimony of MDC President, John Simpkins at U.S. House Committee on Rules
“Ending Hunger in America: Food Insecurity in Rural America” Roundtable
December 8, 2021**

Chairman McGovern, Ranking Member Cole, members of the committee, and fellow roundtable participants, it is an honor to be with you today to discuss the impact of hunger in rural communities across our country.

Today, I am proud to represent my colleagues at MDC. This organization began in 1967 as part of a public-private partnership between the state of North Carolina, under Governor Terry Sanford, and the Ford Foundation. Our original purpose was two-fold:

- Integrate the North Carolina workforce
- Facilitate the transition from an agrarian to an industrial economy

Now working in 13 states across the South, MDC’s understanding of economic mobility, approach to economic development, and commitment to racial and gender equity have led us to prioritize being more directly responsive to the desires of community members to have meaningful work—in any sector—that pays a life-sustaining wage and allows them to provide for the necessities of life: food, shelter, healthcare, transportation, education, rest, and recreation. We equip Southerners of all races to live lives of meaning through work that brings dignity and engagement that finds its full expression in a strong community.

To be clear, I am not here to speak on behalf of rural communities. We have heard and will continue to hear from others on this panel who can speak with greater currency and specificity than I.

That being said, I could be considered the product of a rural community—Lexington, South Carolina. In 1990, Lexington’s population was 3,300; in 2010 it was 17,7900. And today, its population has grown to 23,200.

As a result of that rapid population growth, some would now consider Lexington a suburb of Columbia, South Carolina, instead of a rural area or small town.

Therein lies part of the problem: neither residents nor government can define rural areas with certainty.

What is Rural?

What do we mean when we talk about rural areas? There are differences between the Census Bureau and the Office of Management and Budget (OMB) designations of “rural.”

In 2010, the Census Bureau reported a rural population of roughly 60 million; the rural population by OMB's definition in that same year was 46.2 million.¹

There is also a lack of agreement even among those living in areas that might be considered rural. Some see greater prestige and economic possibility in shedding the "rural" label and seek to be defined as suburban or exurban extensions of a more familiar urban area. Others embrace the rural designation as a marker of cultural and economic distinction. Regardless of how rural areas are defined, these places nevertheless should be priority areas for federal efforts to combat hunger.

Rural Community Assets

America has deep agrarian roots that inform everything about us, from our values to our language to our food. More importantly, rural communities are essential in an increasingly urban country:

- They keep us safe -- 40% of service members and nearly 25% of veterans reside in rural communities.²
- They keep us fed -- two million farms are covering America's rural landscape, and families operate 98%.³
- They keep us clothed and supplied -- with the vast growth of e-commerce, manufacturing and fulfillment centers are increasingly locating to rural areas.
- They keep us entertained and rejuvenated -- rural areas with strong recreational industries, such as southern states with year-round golfing weather, have been growing rapidly.⁴
- They keep us warm, cool, and adequately powered -- while many rural American communities have faced economic challenges, they have also recently experienced incredible growth in wind energy, solar power, and energy efficiency. Rural areas hold 99 percent of all U.S. wind capacity -- enough to power more than 25 million homes.⁵

Beyond these vital functions, other assets in rural communities include community organizations, innovation, and stewardship.

Rural Community Challenges

To be sure, rural communities are not merely repositories of deficits, but they do have challenges, which are unique compared to urban settings.

Rural hunger is but one issue that differs from the same phenomenon in an urban context and often occurs amid agricultural abundance. Hunger is a manifestation of food insecurity, which is perhaps one of the most direct social determinants (or social drivers) of health.⁶

North Carolina's Upper Coastal Plain provides an illustrative example of food insecurity and hunger challenges. North Carolina has the tenth highest rate of food insecurity in the country, with 13.5% of households experiencing food insecurity. The Upper Coastal Plain—which includes Edgecombe, Halifax, Nash, Northampton, and Wilson counties—has 20-24% of food-insecure households. An underdeveloped local food system in the area has resulted in pervasive and persistent food insecurity slowing economic and community development while contributing to increased medical costs and growing health disparities, particularly in communities of color.⁷

The prevalence of debt in rural communities, and again particularly communities of color, only increases the likelihood of food insecurity and its follow-on effects on health and health outcomes. As a member of the *Southern Partnership to Reduce Debt*, MDC collaborates with a wide range of stakeholders to generate actionable policy solutions to address what is essentially a chronic disease within our economy.

Moreover, rural communities remain disconnected from many state and federal supports due to inadequate infrastructure. This limited connectivity is both real and virtual, evidenced by inadequate transportation and limited broadband capacity. The absence of an affordable means of accessing services essentially makes them unavailable in some areas.

Even when communities work to help themselves, there are limited local resources to address rural hunger. For example, the expenditures of SNAP (the Supplemental Nutrition Assistance Program) are 20 times those of all private sources combined.⁸ And that still is not enough to prevent hunger. The experience of the Great Plains Food Bank is indicative of the need for more significant support beyond the Herculean efforts of community members alone.

MDC's work on Food Insecurity

As a partner with the *Kate B. Reynolds Trust's Healthy Places NC* program, MDC managed a learning network of community colleges focused on addressing health and wellness in the community. Below is a snapshot of the colleges' impact on their respective communities. Edgecombe, Nash, and Rockingham community colleges specifically addressed food insecurity. MDC also authored a report detailing the project: [*The Community College as Change Agent: How Community Colleges Address Health Issues in Counties Served by the Healthy Places North Carolina Initiative.*](#)

A body of evidence has shown clear links between socioeconomic status, the practice of healthy eating, and the incidence of these chronic conditions. For low-income communities, a significant barrier to healthy foods is cost. Less-healthy, energy-dense foods come at a cheaper price tag and often last longer than perishable fresh ingredients.

Although unhealthy food is often cost-effective in the short term, the long-term financial burden of chronic conditions is far greater. However, many low-income families cannot

make the initial investment of reshaping a diet due to other immediate responsibilities and demands. Beyond cost, healthier recipes also require a time investment and can become intimidating to prepare. Considering these variables, it became clear that intervention addressing diet needed to not only be cost-effective but easily implemented into the lives of community members ²:

- **Rockingham County: Edible Greenhouse.** The lead team proposed an initiative focused on empowering local farmers, educating the larger community on advanced local food production, and setting the groundwork for a system that provided an economic reward for healthier food decisions. The foundation of this project involved the development of an edible greenhouse that utilized advancements in agricultural practices to produce fresh fruit and vegetables on the college campus.
- **Nash County: Healthy Places Healthy People Dining Room.** The dining room allowed NCC to provide a space on the campus in which one of the college's culinary chefs could interactively demonstrate and teach participants how to create healthy eating options. Phase I of the HPNC initiative at NCC increased awareness and understanding of the effects of healthy eating choices through menu recipes, preparation tips, food substitution suggestions, and tasting opportunities.
- **Edgecombe County: Community Food Gardens.** The lead team began designing two community garden projects, working with their previous developer, at W.A. Pattillo Elementary School, a Title 1 school serving predominately low-income African Americans, and Iglesias Internacional Principe De Paz, a predominately Hispanic church. Constituents of both sites were trained on the garden's upkeep and provided educational materials regarding maintenance. The gardens were intended to instill a sense of responsibility that came with the reward of fresh fruits and vegetables for community members to enjoy for both sites.

Hunger is everyone's problem. Rural hunger debilitates communities, dehumanizes individuals, and deprives the country of the full expression of the gifts of our rural neighbors. It prevents us from leading lives of meaning and dignity-- lives that are fully realized in strong, healthy communities.

***About MDC:** MDC equips Southern leaders, institutions, and communities with the necessary tools and strategies to advance equity—particularly racial and gender equity—and economic mobility. For over 50 years, institutions, communities, foundations, and others across the South have turned to MDC for deep knowledge and proven tools to design, demonstrate, and sustain what works to boost members of underinvested communities to higher rungs on the economic ladder.*

United States House Committee on Rules

“Ending Hunger in America: Food Insecurity in Rural America”

Testimony of Chris Bernard, JD
Executive Director
Hunger Free Oklahoma

December 8, 2021

Chairman McGovern, Ranking Member Cole, and distinguished members of the House Committee on Rules thank you for the opportunity to share our experiences working to end hunger in Oklahoma and rural communities. My name is Chris Bernard, and I serve as the founding Executive Director of Hunger Free Oklahoma.

Hunger Free Oklahoma’s mission is to leverage the power of collaboration to solve hunger in Oklahoma by improving systems, policies, and practices. We do not distribute food; instead, we strive to end hunger through collaboration, capacity building, technical assistance, research, and advocacy. We are also the state SNAP outreach contractor and the administrator of the nutrition incentive program, Double Up Oklahoma. We were formed 5 years ago to do exactly what our name says; make Oklahoma hunger-free. Unfortunately, Oklahoma has some of the worst food security statistics in the nation – one in seven households,¹ one in six seniors,² and one in five children are food insecure.³

We work to address hunger in both urban and rural settings. While work in one setting can inform work in the other, rural Oklahoma has its own unique challenges and opportunities. Rural Oklahoma is not a monolith. It includes historically Black towns, the Ozark plateau, ranch land, farm land, capitals of sovereign nations, and many other unique communities. It has a rich diversity of people, communities, issues, and solutions and there is no way for us to cover every aspect of such a unique community in the time we have today. Solving rural hunger requires a deeper and longer discussion that includes a wide array of stakeholders, which is why Hunger Free Oklahoma supports a White House conference on hunger. Yet today, I do hope to offer you some commonalities of our rural communities to inform your work as policy makers.

Over the past five years, we have seen unprecedented collaborative and individual efforts to address hunger in Oklahoma. The Regional Food Bank of Oklahoma and Community Food Bank of Eastern

³ Feeding America. (2019). Map the Meal Gap. Available at: <https://map.feedingamerica.org/county/2019/child/oklahoma>.

Oklahoma, the Oklahoma Department of Education, the Oklahoma Department of Human Services, the Chickasaw Nation, and many others have worked tirelessly with us and others to create lasting impact. Prior to the pandemic Oklahoma's food security was improving, but even then, less than 10% of children participating in free and reduced-price lunch accessed summer meals,⁴ tens of thousands of eligible Oklahomans didn't utilize SNAP benefits,⁵ and WIC participation was declining.⁶

The barriers we see in the communities we partner with are likely no surprise to any of you. Barriers like transportation, access to broadband and technology, stigma, and limited community resources are a few of the common hurdles which we have witnessed many times over.

We see the impact of limited transportation and program rigidity on a community when the only WIC-certified store closes and the next closest is more than 20 miles away.

We see entire counties with almost no access to fresh food because of people, dollars, and ultimately stores leaving their communities for areas with more economic opportunity.

We receive calls from thousands of Oklahomans to our SNAP enrollment assistance hotline for help enrolling in SNAP because of barriers to using the online application or reaching a physical application site.

We see summer meal sites close because not enough children can get there safely, even though the data demonstrates great need.

We also see tremendous strength in rural communities despite the many barriers. Rural communities are built upon strong social connectedness and the determined, resilient, solutions-oriented people living in them.

These strengths, when leveraged, can make a huge impact.

We see partnerships like those in Enid, Oklahoma where the local library and the food bank partnered to provide critical summer nutrition and literacy programming in high need communities, boosting access and participation for both programs.

We see communities come together to address hunger through collaborations that support local food systems, build community-wide outreach projects, and target community health. Such as in Perry Oklahoma where a group of concerned local organizations started an anti-hunger coalition and secured funding to offer nutrition incentives at their local grocery store – improving nutrition security and the local economy.

We see how changes to the federal nutrition programs made during the pandemic increased household food budgets and access to meals because they removed barriers, created flexibilities, and prioritized people. We have seen what works.

If we are really going to end hunger in Oklahoma we need the help of federal policymakers. We ask that Congress:

1. **Leverage the proven effectiveness and efficiency of SNAP and electronic benefit programs to reduce food insecurity and support local economies.** Rural SNAP participants are estimated to spend 30 percent more on food than their urban counterparts.⁷ By enhancing these programs, you are not only fighting hunger, you are also keeping local businesses open, creating jobs, and ultimately helping to hold a community together. Specific policies Congress should act upon include:
 - a. Authorize the Summer Electronic Benefits Transfer Program permanently. Past Summer Electronic Benefits Transfer Program pilots indicate that access to this benefit allows for the reduction of extremely low food security by one-third, and food insecurity by one-fifth, and improves nutrition for children.⁸ By permanently authorizing the Summer Electronic Benefits Transfer Program we can ensure that kids do not go hungry during the summer.
 - b. Ensure Supplemental Nutrition Assistance Program (SNAP) benefits reflect the costs of a healthy diet. One of the greatest challenges regarding SNAP is the benefit amount for most households is not enough to get through the entire month with enough healthy food for their family. The USDA's recent action, as directed by the 2018 Farm Bill, reviewing the adequacy and subsequently increasing the *Thrifty Food Plan* calculation is a major step in the right direction. However, this should not be a one-time action; there must be regular review and benefit adjustments.
 - c. Allow for simultaneous participation in FDIPIR and SNAP. Native Americans experience some of the highest rates of food-insecurity and diet-related chronic illnesses.⁹ FDIPIR is a commodity-based program, but, unlike other commodity-based programs such as WIC and TEFAP, simultaneous participation in SNAP is prohibited. This prohibition is inequitable and limits the potential economic impact for Native American communities.
 - d. Permanently authorize WIC program flexibilities implemented during the pandemic. Pandemic program waivers have allowed WIC to issue benefits remotely and to offer flexibilities in the WIC shopping experience, which have enabled families to use their WIC benefits more fully amidst food supply chain issues and social distancing requirements. As a result, WIC participation has increased by 2.1 percent nationally. Additionally, vouchers intended to increase WIC participants' fruit and vegetable purchasing power should remain in place or be incorporated into a comprehensive increase of the WIC benefit amount.
 - e. Provide sufficient funding structures to scale Gus Schumacher Nutrition Incentive Programs (GusNIP) and/or integrate them into EBT systems. Hunger Free Oklahoma took the Double Up Oklahoma program on two years ago and has successfully grown

⁷ USDA (2017). The Food-Spending Patterns of Households Participating in the Supplemental Nutrition Assistance Program. Available at: <https://www.ers.usda.gov/webdocs/publications/84780/eib-176.pdf>.

⁸ Food Research & Action Center (2019). The Summer Electronic Benefit Transfer Program. Available at: <https://frac.org/research/resource-library/the-summer-electronic-benefit-transfer-program-summer-ebt>.

the benefit from \$90,000 to \$2.4 million. The increased access to healthy foods through GusNIP is transforming rural towns like Okemah, Oklahoma where SNAP purchases for fruits and vegetables have increased by over 100%. Organizations and states are ready to expand the scale and impact of nutrition incentive programs across the country, but limited resources are restricting innovation and impact. Increased funding, adjustment of the federal match from a 1:1 ratio to a 3 or 4:1 ratio, and providing funding for integration of programs into the EBT systems would facilitate expansion of programs and better incentivize states to help to fund these programs.

- 2. Remove program requirements that exacerbate barriers.** Federal Child Nutrition Programs in particular include several one-size-fits-all program requirements that are not responsive to individual community needs and circumstance. Specific policies Congress should act upon include:
 - a. Remove or provide exceptions to the congregate meal requirements of summer and afterschool meals. Congregate meal requirements can be best leveraged in areas with greater population density. Children in rural Oklahoma often live many miles away from the nearest meal site making it burdensome and costly for families to access the much-needed support. The lack of demand ultimately translates to fewer meal sites due to lack of economic feasibility for program sponsors.
 - b. Expand other proven models designed for our most isolated areas including programs like the Meals to You pilot. Some rural areas may never have enough density to support even a non-congregate meal site. Families in these areas need innovative approaches to reduce childhood food insecurity when children are out of school. In 2020 the Meals to You pilot program expanded during the pandemic providing over 39 million shelf-stable meals to children in rural areas across the country.¹⁰
 - c. Authorize flexibilities that allow for additional meals for children who stay later in the evening in child care settings. Meal site sponsors are limited to serving only two meals per day, with very limited exceptions.¹¹ However, there are sponsors who have the capacity and interest in serving three meals a day but are unable to due to these restrictions. Removing this restriction will ensure more regular access to meals for children who are food insecure.
- 3. Fund cross sector community level collaborations and solutions.** Funding local-level collaboration will help communities address their needs in innovative ways which can be shared with those facing similar challenges. Specific policies Congress should act upon include:
 - a. Support public-private partnerships focused on addressing hunger and poverty in communities by fully funding section 4021 of the Agriculture Improvement Act of 2018. Rural communities know their own strengths and barriers best and often recognize that to achieve a goal it takes a community-wide effort. Congress authorized a program to support public-private partnership pilot projects to address food insecurity in the 2018 Farm Bill, but has not yet provided funding for this program.

¹¹ USDA Food and Nutrition Services. (2016). Meal Service Requirements in the Summer Meal Programs. Available at: <https://www.fns.usda.gov/cn/meal-service-requirements-summer-meal-programs-questions-and-answers-revised>.

- b. Create new funding streams that will fund community-driven solutions across issue areas to meet the whole needs of a community. Siloed funding streams that focus on one specific subject matter such as food insecurity, health, or housing while useful can also create serious barriers for small rural communities to access. Creating funding streams that allow a community to address an array of issues with the same funds will facilitate easier access for rural communities and more efficient solutions.

The recommendations set out in this testimony reflect the sentiments shared by members from both sides of the aisle and many hunger experts before me. We must empower people and communities to make their own choices and determine what solutions are best for them. We must remove red tape and invest in communities. We must incentivize rather than restrict. We must leverage the strengths of our private sector and existing systems, while ensuring equitable access. We must fund and scale what works!

In Oklahoma and in rural areas across the country working solutions are ready to be scaled, we just need the resources and flexibilities to make it happen. Hunger Free Oklahoma extends an open invitation to members of congress to come to Oklahoma to see and hear first-hand from our partners and community members about our successes, struggles, and determination to solve hunger permanently. Chairman McGovern, Ranking Member Cole, and distinguished committee members, thank you for your time and I look forward to your questions.

Thank you, Chairman McGovern, and other Rules Committee members. I feel very privileged to be here today to discuss the subject that's so near and dear to my heart. My name is RF Buche with GF Buche Company. I'm a fourth generation South Dakota grocer, and I've been in this business since I was four years old and snuck out of a snowstorm to go work with my dad, so I've been in a long time. My great grandfather, Gus Francis Buche – hence the GF Buche Company – started this company in Lake Andes in 1905. Currently, we have 20 locations in 12 different communities throughout South Dakota. All 20 communities are rural, and 19 of those 20 locations are either on or near an Indian reservation. We've been operating in Indian country for 116 years, so food within the Native American communities has been bred into me, and I'm very passionate about the customers living on and near the reservations throughout South Dakota.

I have a couple projects to tell you about that we've been doing to help fight hunger. Our first one is called Feed the Hungry; our goal is to provide food essential items for those in need in times of a gap in benefits. As you all know, when a person goes to sign up for SNAP, they don't receive those benefits immediately, so they'll go to their local food pantry to be able to get items until their SNAP benefits begin. We do a fundraising event held in each of our 20 locations between early November and Christmas when customers are feeling the most generous to help stock food pantries across the communities in South Dakota we operate in. There are no administrative costs, and one hundred percent of the money collected goes right to those in need. Additionally, I personally match up to 500 dollars for each of the 17 non-profit food pantries. We have been doing this for nearly 10 years and have raised thousands for those in need.

Another project that I'm working on is a travel trailer for essentials, food and other grocery items. Our goal is to provide healthy foods as well as essential products to areas where there is little means of transportation. GF Buche Company is working with a non-profit organization named One Spirit on the Pine Ridge Indian Reservation to secure a semi-trailer and truck with both frozen and cold storage so that we can, on a consistent basis, transport grocery items to those communities that are anywhere from 50 miles on into 10 miles away from a grocery store. We plan to go out to these districts, which are small communities on the reservation, and sit there for half-day, or one day a week, and have food available for those customers that don't have transportation. This will definitely fill a void, but it certainly doesn't leave much for variety and choices for the people.

The project I'm most excited about is food delivery to lockers, we hope to be rolling this out during the first quarter of 2022. Our goal is to provide healthy foods, as well as essential products, to areas where there is very little means of transportation. GF Buche Company received a grant to install temperature-controlled food lockers – similar to a school locker, but with frozen and cold storage as well as ambient storage – which will allow us to store anything from frozen vegetables to fresh vegetables to canned vegetables. We are putting these lockers in Marty, South Dakota, which is a town 16 miles away from the nearest grocery store. Marty is on the Yankton Sioux Reservation, and these lockers will give customers the ability to shop online with any smart device – or they can shop directly from the unit. The lockers will be put in a community center that has very flexible hours and is in a location for people to easily get to. Customers will be given a locker code when they order their groceries, and then they will be able to go in and pick up those groceries. Residents will also be able to use SNAP benefits in addition to debit and credit payments. A cold delivery truck will be used to bring these residents their groceries and deposit them into the lockers within the unit, so we are super excited to be rolling this project out because I think that this is something that could potentially work not just in small communities within the reservations, but in small town across America.

GF Buche Company is the only South Dakota independent grocery retailer that has been approved to accept SNAP benefits online. This allows SNAP participant customers the ability to order food online and have a safe, contact-free, online experience just like any other customer.

Lastly GF Buche Company will be participating in a test of online WIC purchasing, working with the State of South Dakota and the Rosebud Sioux Tribe. WIC clients living on the Rosebud Sioux Reservation, the Pine Ridge Reservation, as well as four other reservations across the state, will be able to order WIC online as well.

But none of these ideas will ever completely work to end hunger in rural and Native American communities until something is done to enforce our federal antitrust laws. Big box stores and dollar chains are leveraging their power over manufacturers to create unfair competition and dominate markets not just in South Dakota but in small towns throughout the country. We are competing heavily with dollar store formats – which have recently popped up in every rural town – where approximately 70 percent of their sales are consumable products. That means that 70 percent of their sales compete heavily with my grocery store and every other independent and family-owned grocery store across this country. However, dollar stores primarily carry ultra-processed foods which means very little to no healthy options for their customers, further leading to obesity and other negative health outcomes. What programs or initiatives do dollar stores participate in and contribute to in the communities they serve? The answer is few, if any. You'll never see their name on the back of a ball team uniform or as sponsors of a local food drive.

How do dollar stores drive independents like myself out of business? They use “cheater size” packaging, which is a size of product that looks the same as you can find in your local grocery store, but it is actually smaller. Customers see a cheaper price at their dollar store but fail to realize that the price point also reflects the sizing. Where antitrust issues are concerned, these dollar chains restrict manufacturers from selling those smaller-sized products to independents like myself so I can't even compete fairly.

The worst abuse, however, from these national big-box stores and dollar chains is how they prevent independent grocers from getting the products we need to keep our shelves stocked and our customers happy. Let me put into context how pervasive these anticompetitive practices are. My wholesaler affiliate, Associated Wholesale Grocers (AWG), out of Kansas City, KS, is the largest cooperative wholesaler in the United States and does \$22 billion in retail sales annually. But during the pandemic, Ball™ who produces jars and jar lids for canning vegetables and other products, decided not to sell their products to AWG so those customers of mine that want to live off the land and want to eat healthy and use canning as a source to get through the winter, can't buy them from me. But you can go into any Target or Walmart and find their product on the shelf. Unfortunately, that doesn't do my customers any good because the nearest Walmart or other big-box chain closest to the communities I serve is over 50 miles away.

Likewise, during the pandemic, AWG was forced to put allocations on all kinds of products like ramen noodles, ground beef, Pedialyte and formula for babies, as manufacturers prioritized their big-box and national accounts well before independents. The quantities we received were so limited that we had to personally drive product from our lower volume stores to fill shelves at other locations that were out. The distance from our lowest volume store to our store in Pine Ridge is 253 miles; not the most economical situation for me, but that doesn't concern me one bit. I'm glad to do it for my customers if it means they won't go hungry. But picture this, please: Pine Ridge, one of the poorest counties in the nation, not having WIC items like formula for babies on their local grocery store shelf because my big-box and national competitors can force manufacturers to fill their orders and disregard independents.

I apologize if I seem a little upset about antitrust laws not being enforced and unfair competition being the result, but it's because I care passionately about my customers going hungry and I truly believe this is a life-or-death situation. Can you imagine if we didn't make that twice-a-week twice trip, consisting of over 500 miles per week? People on the Pine Ridge Indian Reservation could have starved, and that's just wrong. Unless we start enforcing antitrust laws, guys like me are going to disappear by the thousands across the country. And I'll guarantee there will not be a CEO from Walmart or Dollar General that will drive across this state to deliver food and goods to their customers. Thank you.

Testimony of Rebecca Naragon, United South and Eastern Tribes For the Record of the House Rules Committee Roundtable on “Ending Hunger in America: Food Insecurity in Rural America”

Good afternoon and thank you to Chairman McGovern and committee staff for the invitation to be with you all this afternoon. My name is Rebecca Naragon, I am a citizen of the Poarch Band of Creek Indians, and the Economic Development Director for United South and Eastern Tribes (USET). We appreciate and support Chairman McGovern’s focus on ending hunger in America. Food insecurity affects Tribal Nations and Indian Country, frequently to greater degrees than other jurisdictions and communities in the United States. 1 in 4 Native Americans experiences food insecurity, for example, compared to 1 in 8 people in the U.S. general population.

However, meaningful inclusion of Tribal Nations in this initiative requires an understanding of the history of U.S. – Tribal Nation relations, trust and treaty obligations, and the unique, and diverse circumstances of the 574 federally recognized Tribal Nations. Despite the complexity of our experiences, we share in common the failure of the U.S. government to live up to promises made in exchange for the cession of our land and resources. These promises are not based in poverty or need, but rather are a payment on debt to Tribal Nations. And the failure to deliver upon these promises, including the chronic underfunding of federal Indian programs and a failure to fully recognize Tribal sovereignty, as well as historic and current federal Indian policy, are largely responsible for food insecurity and other substandard living conditions faced by Native American people today. This includes a failure to promote and support economic development in Indian Country.

USET SPF is a non-profit, inter-tribal organization advocating on behalf of thirty-three (33) federally recognized Tribal Nations from the Northeastern Woodlands to the Everglades and across the Gulf of Mexico.¹ USET SPF is dedicated to promoting, protecting, and advancing the inherent sovereign rights and authorities of Tribal Nations and in assisting its membership in dealing effectively with public policy issues. While many of our members are rural, which we understand is the focus of today’s roundtable, many are also adjacent to urban centers. Regardless of location, however, a majority of Tribal Nations, with few exceptions, continue to experience the conditions described during the December 8th Roundtable. Proximity to an urban center does not necessarily alleviate these issues for Tribal Nations.

¹ USET SPF member Tribal Nations include: Alabama-Coushatta Tribe of Texas (TX), Aroostook Band of Micmac Indians (ME), Catawba Indian Nation (SC), Cayuga Nation (NY), Chickahominy Indian Tribe (VA), Chickahominy Indian Tribe–Eastern Division (VA), Chitimacha Tribe of Louisiana (LA), Coushatta Tribe of Louisiana (LA), Eastern Band of Cherokee Indians (NC), Houlton Band of Maliseet Indians (ME), Jena Band of Choctaw Indians (LA), Mashantucket Pequot Indian Tribe (CT), Mashpee Wampanoag Tribe (MA), Miccosukee Tribe of Indians of Florida (FL), Mississippi Band of Choctaw Indians (MS), Mohegan Tribe of Indians of Connecticut (CT), Monacan Indian Nation (VA), Nansemond Indian Nation (VA), Narragansett Indian Tribe (RI), Oneida Indian Nation (NY), Pamunkey Indian Tribe (VA), Passamaquoddy Tribe at Indian Township (ME), Passamaquoddy Tribe at Pleasant Point (ME), Penobscot Indian Nation (ME), Poarch Band of Creek Indians (AL), Rappahannock Tribe (VA), Saint Regis Mohawk Tribe (NY), Seminole Tribe of Florida (FL), Seneca Nation of Indians (NY), Shinnecock Indian Nation (NY), Tunica-Biloxi Tribe of Louisiana (LA), Upper Mattaponi Indian Tribe (VA) and the Wampanoag Tribe of Gay Head (Aquinnah) (MA).

Because there is Strength in Unity

Economic Development in Indian Country and the USET Region

Prior to European contact, Tribal Nations, including our members, had a long history of dynamic economies and governance structures. Robust trade networks connected Tribal Nations and the goods they produced. As with other aspects of Tribal governance and infrastructure, the removal, termination, and assimilation policies of the United States government negatively impacted traditional economic trade. Over the course of centuries, Tribal Nations ceded millions of acres of land and extensive resources to the U.S.—oftentimes by force— in exchange for which it is legally and morally obligated to provide benefits and services in perpetuity. Because of this historic and ongoing diplomatic relationship, the federal government has trust and treaty obligations to support Tribal self-governance and self-determination, along with rebuilding Tribal Nations and economies. At no point has the government fully delivered upon these obligations.

In addition to being relegated to fractions of our original homelands, which can be in remote areas, Tribal Nations lack governmental parity in economic development opportunities and treatment under the U.S. tax code. The Federal Reserve Board of Governor's 2012 report, *Growing Economies in Indian Country*, outlined eight issues as fundamental challenges to realizing economic growth in Indian Country. USET and member Tribal Nations, with few exceptions, face these same challenges:

1. Insufficient access to capital
2. Capacity and capital constraints of small business
3. Insufficient workforce development; financial management training; and business education
4. Tribal governance constraints
5. Regulatory constraints on land held in trust and land designated as restricted use
6. Underdeveloped physical infrastructure
7. Insufficient research and data
8. Lack of regional collaboration

All Tribal Nations, especially USET member Tribal Nations, vary in levels of economic activity, capacity and development. Some Tribal Nations have decades of experience and familiarity with economic development initiatives; some are just starting in their journey in this sector. This diversity demands that federal policy not adopt a one-size-fits all approach.

While the obstacles that Tribal Nations face certainly contribute and exacerbate food insecurity and other issues in Indian Country, we continue to fight for our economic sovereignty and greater economic development on our lands. Tribal Nations engage in a wide variety of economic development in order to fund essential government services and provide for our people. USET's comprehensive economic development strategy (CEDS) plan contributes to the region's effective economic development through a locally-based, regionally-driven economic development planning process of USET member Tribal Nations and partners. The 2016 Plan identified several economic clusters that member Tribal Nations participate in, including Agriculture, Aquaculture, and Fishing; Artisan – Handmade; Digital Media and Film; Forest/Wood Products; Tourism; Entertainment; Energy; Niche Manufacturing; Business Services; and Healthcare. This diversity is also illustrated in the USET Tribal Enterprise Directory and the over 600 business firms and activities across 21 industries. Since the focus of this roundtable is on rural economic development, we offer the following member examples:

- A maple syrup bottling and branded enterprise, Passamaquoddy Maple, by the Passamaquoddy Tribe in Maine: In 2013, the Passamaquoddy Tribe created an economic development project to tap into a traditional natural resource: maple syrup. Since the operation began, Passamaquoddy Maple has tapped over 10,000 trees and produced over

a thousand gallons of maple syrup. The enterprise has also created 6 seasonal and full-time jobs for the Passamaquoddy people.

- A local produce provider, Choctaw Fresh Produce, by the Mississippi Band of Choctaw Indians in Choctaw, MS: Since 2012 the farm, located in Choctaw, Mississippi on the Mississippi Band of Choctaw Indians Reservation, specializes in Direct-Store-Delivery throughout Central Mississippi to a broad variety of organic-focused buyers – from grocers and to institutions, to community farmer’s markets.
- A technical service contracting firm, Tiya Support Services, by the Chitimacha Tribe of Louisiana: As a member of the 8(a) graduate Keta Group, LLC, the multifaceted company has expertise and resources to provide organizations with everything from facility management to construction, disaster relief, engineering, technical services, and more.
- Local artist support through Authentically Cherokee, by the Eastern Band of Cherokee Indians in Cherokee, NC: The Authentically Cherokee store offers products made by Cherokee artists from the Qualla Boundary that reflect each artist’s own interpretation of their culture and the world around them.

It is critical to note that Tribal Nation economic development has the ability not only to alleviate food insecurity and other similar conditions for Tribal citizens and on Tribal homelands, it also contributes to larger regional growth and success, increasing economic security for non-Tribal citizens. For example, a USET member Tribal Nation located in the southeast, has an expansive portfolio of various businesses. Revenue from these businesses supports community programs for Tribal and local citizens, contributes to the needs of the local community through philanthropic giving, and the Tribal Nation has become one of the top employers in the entire state. When Tribal Nations succeed, positive impacts are felt far beyond our jurisdictional boundaries.

Honoring and Supporting Tribal Sovereignty to Promote Economic Development and Reduce Food Insecurity

Economic sovereignty is essential to Indian Country’s ability to be self-determining and self-sufficient. Rebuilding of our Tribal Nations involves rebuilding of our Tribal economies as a core foundation of healthy and productive communities. Building strong, vibrant, and mature economies is more than just business development. It requires comprehensive planning to ensure that our economies have the necessary infrastructure, services, and opportunities for our citizens to thrive; thus resulting in strong Tribal Nations. In order to achieve economic success, revenues and profits generated on Tribal lands must stay within Indian Country in order to benefit from the economic multiplier effect, allowing for each dollar to turn over multiple times within a given Tribal economy. It is critical that inequities and the lack of parity in policy and federal funding be addressed for Tribal Nations in order to fully exercise our inherent self-governance to conduct economic development activities for the benefit of our Tribal citizens.

Tribal Nation economies thrive when Tribal sovereignty and self-governance are supported and upheld. When Tribal governments are empowered to make decisions in response to local conditions and priorities through self-governance, especially in ways that support cultural principles, all metrics of economic prosperity benefit, i.e. lower rates of unemployment, higher rates of household income, etc. As members of the House Rules Committee, you can support Tribal economic development by crafting policy that:

- Acknowledges our sovereign status and provides for governmental parity;
- Funds Tribal Nations directly and ensures these funds can be received through self-governance contracts and compacts;

- Recognizes the diversity of Indian Country by providing appropriate flexibility in use of funds and programmatic implementation, and deferring to Tribal Nations to set standards; and
- Avoids competitive grants, pass through funding, matching funds, non-duplication requirements, and extensive reporting.

Policies promoting economic sovereignty are just one way to address food insecurity for our people. We provide the below recommendations as the Committee works to better understand the uniqueness of Indian Country.

Economic Parity

With nearly every aspect of economic development controlled by the federal government, economic progress within Indian Country moves at a slower pace than needed. Congress and the Administration must work to free Tribal Nations from the over-burdensome regulations that impede our success. This is especially important in an environment of fiduciary failures via inadequate funding for Indian programs.

The U.S. government has a responsibility to ensure that federal tax law treats Tribal Nations in a manner consistent with our governmental status, as reflected under the U.S. Constitution and numerous federal laws, treaties and federal court decisions. With this in mind, we remain focused on the advancement of tax reform that would address inequities in the tax code and eliminate state dual taxation. Revenue generated within Indian Country continues to be taken outside our borders or otherwise falls victim to a lack of parity. Similarly, Tribal governments continue to lack many of the same benefits and flexibility offered to other units of government under the tax code. USET SPF continues to press Congress for changes to the U.S. tax code that would provide governmental parity and economic development to Tribal Nations.

This includes support for H.R. 4505, the Tribal Tax and Investment Reform Act, introduced by Rep. Ron Kind. H.R. 4505 would specify the treatment of Tribal Nations as States with Respect to Bond Issuance, modify the treatment of pension and employee benefit plans maintained by a Tribal Government, modify the treatment of Tribal Foundations and charities, improve the effectiveness of Tribal child support enforcement agencies, and recognize Tribal governments for purposes of determining whether a child has special needs eligible for the adoption tax credit. We further note and support the inclusion of Tribal parity for bond issuance in the House-passed version of the Build Back Better Act.

Dual Taxation

Dual taxation hinders Tribal Nations from achieving their own revenue generating potential. Although Tribal Nations have authority to tax noncitizens doing business in Indian Country, when other jurisdictions can tax those same noncitizens for the same transactions, Tribal Nations must lower their taxes to keep overall pricing at rates the market can bear or forgo levying a tax at all. The application of an outside government's tax often makes the Tribal tax economically infeasible.

Dual taxation undercuts the ability of Tribal Nations to offer tax incentives to encourage non-Indian business entities onto the reservation to create jobs and stimulate the Tribal economy. As long as outside governments tax non-Indian businesses on the reservation, even if a Tribal government offers complete Tribal tax immunity to attract a new non-Indian business to the reservation, that business is subject to the same state tax rate that is applicable off-reservation. As a matter of economic fairness, we ask that you work with us to support and advance initiatives that would bring

certainty in tax jurisdiction to Tribal lands by confirming the exclusive authority of Tribal governments to assess taxes on all economic activities occurring within our borders.

Traditional Foods

In addition to changes in federal Indian policy related to economic development, we must also focus on food and nutrition policy. Though Tribal Nations have access to millions of acres of land that are already engaged in some form of agriculture or food production, these foods do not stay within Tribal communities. At this time, the \$3.4 billion generated annually through Tribal agriculture efforts is more than 99% raw commodities, instead of the healthy, local, economically beneficial, and nutritious food needed in Tribal communities and rural areas. Access to traditional and healthy foods is not just an economic issue, but a health and sustainability issue as well. Increasing access to these foods is a crucial part of the solution to food insecurity in Indian Country.

Across Indian Country, Tribal Nations and Tribal producers are actively engaging in food sovereignty projects that would increase the amount of traditional food, including fresh fruit, meat, and vegetables within Tribal communities. Congress must ensure Tribal food sovereignty and traditional food programs are supported. This includes ensuring Tribal Nations and Tribal agriculture programs have equal access to vital agriculture programs that would support traditional food programs, including, for example, the Specialty Crop Block Grant Program. The sustainability of traditional foods and crops are vital to the cultural and spiritual lives of Tribal citizens.

Tribal products must also be given the maximum protection under federal law so that they are protected from non-Tribal commercialized purposes. Tribal products are often derived from traditional seeds, which are among the most sacred items to individual Tribal Nations. The federal government must uphold the inherent right and sovereign status of Tribal Nations to protect traditional seeds not just to ensure biosecurity and food security for their communities, but to preserve market competitiveness for Tribal products as well.

Self-Governance for SNAP and Forestry Programs

As a matter of governmental parity, Tribal Nations must have the authority to engage in Tribal Self-governance to administer the Supplemental Nutrition Assistance Program (SNAP), Food Distribution Program on Indian Reservations (FDPIR) and other vital nutrition programs. Tribal Nations, like other units of government, are responsible for providing essential services to their citizens, including those related to nutrition. Tribal Nations have demonstrated we have the capacity to fully administer SNAP programs to Tribal citizens, as we have been administering far more complex federal programs for decades. However, and in spite of a 2014 USDA feasibility study, Tribal Nations continue to be excluded from administering SNAP and other nutrition programs under P.L. 93-638 contracting and compacting. The 2018 Farm Bill authorized a P.L. 93-638 demonstration projection for FDPIR, but this authority should be guaranteed to any Tribal Nation that wishes to USET SPF joins Tribal Nations and organizations across the country in calling upon this Committee and this Congress to ensure that Tribal sovereignty and self-determination for federal nutrition programs is made a reality, including as part of the upcoming Farm Bill reauthorization.

In addition, we urge that P.L. 93-638 authority also be extended to forestry programs at the U.S. Department of Agriculture. When Tribal Nations manage our own forests, we are able to prioritize traditionally harvested plants and animals that provide vital elements of a healthy Indigenous diet. Wild harvested foods are often more nutritionally dense than their cultivated counterparts and they

carry a cultural connection for Indigenous people. Nutritious, local foods are an essential part of any solution to food insecurity.

Need for Broader Engagement with Indian Country

As noted during the Roundtable, Indian Country's diversity and complexity cannot be represented by a single individual or organization. With this in mind, we were pleased to know that Chairman McGovern intends to engage Tribal leaders for a roundtable in this series specific to Indian Country. This will facilitate the meaningful inclusion of Tribal Nations and Native American people, as the Chairman seeks to address food insecurity, and contributing issues, throughout the country.

Conclusion

Food insecurity in Indian Country is a symptom of the larger issues we face as Tribal Nations, particularly the failure of the U.S. government to live up to the terms of our diplomatic, Nation-to-Nation relationship. Solutions that recognize and uphold our inherent sovereignty and trust and treaty obligations are necessary to alleviate food insecurity and improve conditions for Tribal Nations and Native American people. We urge you to keep this in mind as you seek ways to meaningfully include Tribal Nations, as well as address hunger at its roots in the United States. We commend your efforts thus far, appreciate the opportunity to participate in the Roundtable, and welcome further engagement as this initiative proceeds.

Center for Rural Strategies

Mission

At the Center for Rural Strategies, we seek to improve economic and social conditions for communities in the countryside and around the world through the creative and innovative use of media and communications. We strive to create better opportunities for small towns and rural communities by building coalitions, developing partnerships, leading public information campaigns, and advancing strategies that strengthen connections between rural and urban places.

By presenting accurate and compelling portraits of rural lives and cultures, we hope to deepen public debate and create a national environment in which positive change for rural communities can occur.

Rural Strategies helps communities and nonprofit organizations incorporate media and communications into their work in support of strategic goals. We also design and implement information campaigns that educate the public about the problems and opportunities that exist in contemporary rural communities.

Rural Strategies publishes information about rural issues, works with press to assist them in the coverage of rural topics, and works with a wide range of partners to build a stronger voice on behalf of rural communities.

We believe that rural America's fate is interrelated to those of metropolitan and urban America. Building stronger rural communities helps the nation as a whole.

Projects

The Center for Rural Strategies' goal is to help establish a rural America that is more connected and more inclusive through work on strategic communications, coalition building, public information campaigns, and public policy.

Our work focuses on the intersections of areas including economic development, healthcare, broadband, the environment, climate, education, transportation, and immigration. Through working across this broad range of issues, we believe that more just and equitable policies can be crafted.

In this work, we produce and distribute media, create coalitions that cut across sectors and geographies, commission research, and conduct public information campaigns. Our organization is built on alliances with like-minded institutions, nonprofits, and social change activists.

Our major ongoing projects include the [Daily Yonder](#), a digital news platform that covers rural news for a national audience of rural residents, advocates, policymakers, and journalists, and the [National Rural Assembly](#), which works at local, regional, and national levels to build more opportunity and better policy for rural communities across the country.

Rural Strategies also creates strategic messages and communication principles for nonprofit organizations, policymakers, and philanthropies.

If you are interested in working with us, through direct consultation and coaching, workshop-style small-groups, or plenary presentations, please contact us at teresa@ruralstrategies.org.

THE FOOD SYSTEM: CONCENTRATION AND ITS IMPACTS

A Special Report to the Family Farm Action Alliance

Highlights

- Consolidation is happening across all sectors in the food system, at the national and global levels, and has resulted in a particular set of power relationships. This has resulted in numerous negative impacts on farmers, workers and their communities as well as consumers, who have experienced higher prices and less innovation.
- These power relationships impact our food system democracy, and are particularly concerning for marginalized voices and communities.
- Crop acreage is consolidating in larger farms, while the sales midpoint for livestock has starkly increased between 1987-2017. For hogs, the midpoint of sales has increased from 1,200 to 51,300 and in dairy the herd size has gone from 80 to 1,300 cows.
- New processes of integration are occurring. In U.S. pork production, large pork producers own processors and grain elevators, while supermarket behemoths Walmart and Costco are using backward integration in dairy, beef and chicken. Kroger continues its strategy of backward integration in dairy and is supplying competing retailers. In addition, asset management firms are increasing their investments in food and agriculture, potentially reducing competition via common ownership of most of the leading firms in a number of industries.
- In a consolidated system, farmers, workers and the environment are interconnected, meaning that when problems hit one part, they quickly engulf others. For meatpacking, the coronavirus hit workers, and the human tragedy of over 40,000 workers with COVID-19 (189 deaths) quickly became a farm and environmental disaster. Besides the financial hit for farmers who may have euthanized between 300,000 to 800,000 hogs and 2 million chickens, the waste of the embodied resources (28,500 tons of pork, .02% of the 2018-2019 corn crop) is stunning. The inability to control the drift of the herbicide dicamba has divided communities, damaged livelihoods and ecologies, and illuminated the inability of agencies to regulate dominant firms.
- Agrifood consolidation reduces farmer autonomy and redistributes costs and benefits across the food chain, squeezing farmer incomes. In 2018, farmers whose primary occupation was farming but with sales of less than \$350,000 had a median net income of -\$1,524. An agriculture without people has depopulated rural communities causing a collapse in social relationships. Communities of color bear a disproportionate burden of exposure to excessive pesticide use or large animal confinement operations.
- Consolidation obscures ownership to the point that farmers and consumers frequently have far fewer options in the market than it appears. For instance, Anheuser-Busch InBev (Belgium) has acquired 17 formerly independent craft breweries since 2011, although these ties are not indicated on the product labels. Seed companies label the same seeds under multiple brands while products from a single processing plant may be sold under as many as 40 different brands.
- Because political democracy rests on economic democracy and vice versa, our laser focus in scholarship, praxis and policy must be on democratizing the agrifood system at local, state, regional and national scales. Working together, policy-makers, farmers, workers and communities need to fashion alternatives and policies that can help to curb monopolistic tendencies in the agrifood system, to shine a racial lens in scholarship on agrifood system power and consolidation, to prioritize resilience and redundancy, to rethink core assumptions such as efficiency and property rights, and to encourage the development of alternative production and consumption arrangements.

Introduction

In this paper, we report the current state of concentration in the food system in the United States and globally, examine the consequences of that concentration – which have become very evident with the COVID-19 crisis – and suggest avenues for action and transformation of the food system. Our collective scholarship has long been concerned with increasing concentration in agriculture and food because of the impact of the associated economic and political power has on democracy, equity, ecology and community.

In the last 150 years of relatively temperate and stable climate, we have come to rely on a high-yielding, mechanized, capital-intensive system of agriculture and food that operates at a global scale, impacting local places around the globe unevenly. Lyson (2004) succinctly illustrated how technological revolutions including mechanization, the use of chemicals, and biotechnology made agriculture more specialized, disconnecting food production and consumption from particular places and their communities. Big data/digitalization of agriculture continues this trend (Mooney 2018; Rotz et al 2019). These revolutions tend to deskill agrifood labor, rewarding the most powerful firms and exploiting vulnerable labor forces. Our fossil-fuel dependent transportation systems have enabled regional specialization across the globe – for example fruit and vegetable specialization in places such as Spain, Kenya or Mexico, or highly industrialized grain production in the American Midwest or Eastern Europe. These processes have altered producers' relationship with their land and communities, often marginalizing the labor process across the food chain, and changing the relationship of consumers with food acquisition and preparation – transforming ecological and community relationships in the process.

These changes have paved the way for the current social and economic structure of our agrifood system. A capital-intensive system rewards those with access to capital (that is money), and marginalizes those without it. This has become particularly important in an increasingly unequal society, where money and power have accrued to a few, predominantly white households, with agriculture following the same trends. More importantly, money and wealth that is increasing concentrated in the hands of a few risks the notions of dispersed power at the center of Western democracies (Wu 2018).

This concentration of ownership, wealth and power is particularly apparent in the agrifood system where just a few companies dominate almost all aspects of food production. The social and ecological risks associated with our current agrifood system – rising levels of food insecurity and hunger, ecological degradation – are directly related to who has the power to make decisions in food and agriculture. Who decides where and what food will be produced, who produces it and how, and who will get to eat it? We observe that these decisions have increasingly migrated from a more community or public arena (c.f. Weis 2007; Wilkinson 2017) into the realm of private decision-making that largely involves those within the biggest firms, including their management teams, boards of directors and shareholders. Those decision-makers have their eye on increasing their power relative to other firms, and although this may increase their profits, it does not usually align with enhancing the public good. We need only look at the agrifood sector during the COVID-19 pandemic. In a time where the World Food Programme warned that the number of hungry people in the world will double to 270 million people¹ and dairy farmers dumped

¹ <https://www.wfpusa.org/coronavirus/>

their milk while facing bankruptcy,² grain traders like Bunge and ADM reported healthy profits³ and privately held Cargill returned record profits to the family that constitutes their shareholders⁴

Consolidation and concentration are key features across the food system, from aggregating farmland holdings to seeds and fertilizers to processing and manufacturing to distributing and retailing. We have seen horizontal, vertical and global integration within and across the supply chain, across commodities and food sectors, and at multiple scales – from regional markets to global markets. The food system is not unique in the way capital and decision-making is concentrated. Studies show that concentration is a systemic rather than isolated feature of the broader economy, and within agrifood itself (Hendrickson, Howard and Constance 2019; Khan 2020). Recent authors of *The Curse of Bigness* (Wu 2018) and *Goliath* (Stoller 2019) argue that concentrated political and economic power threatens our democracy and must be addressed. From our perspective, it may be even more urgent to address within the agriculture and food system, both in the U.S. and globally, in order to ensure that humanity can be fed in the future.

The distribution of power in the food system, embodied in the power to make decisions about what food is produced, how, where and by whom, as well as who gets to eat – and what they get to eat, is our major focus of concern because of the negative impacts of those decisions to farmers, workers, communities and our ecology. Without a rebalancing of economic and political power within the global food system, humanity confronts a crisis over our very sustenance.

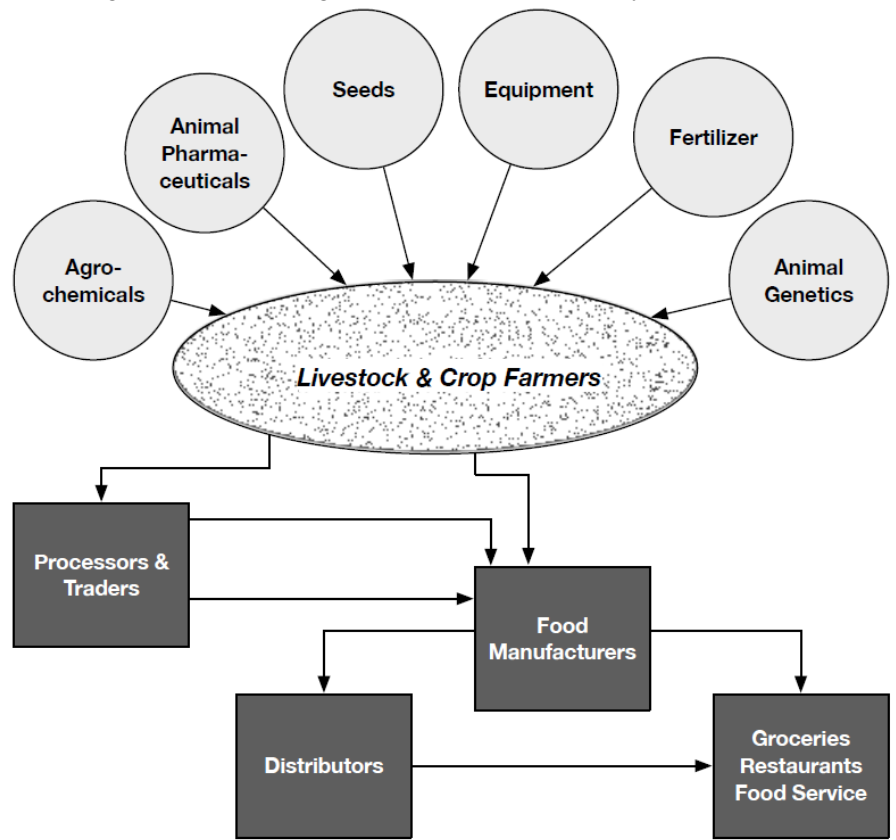

Figure 1: Illustration of different points of consolidation and control in the agrifood system. There are officially close to two million farms in the U.S., but less than half of them consider farming their primary occupations.¹ Still, these million farmers must buy seeds, fertilizers and chemicals from the same few firms as many farmers around the world do, while selling to just a few food processors and traders who operate in the U.S. and globally, who then move food further down the supply chain until it eventually winds up in a grocery store where a majority of us purchase our food.

Current State of Concentration in Key Products and Market Channels

Recent years have seen continued consolidation in numerous food and agricultural industries. These patterns stem from mergers and acquisitions among formerly separate firms, as well as the exit of other competitors. The result is more concentrated markets, or sales that are dominated by fewer and larger firms. A simple measure of concentration is a ratio, typically the combined share of the top 4 firms, or concentration ratio 4 (CR4). A limitation of the CR4 is that it only measures horizontal changes, and firms are increasingly integrating vertically, such as by acquiring upstream suppliers or downstream customers. In addition, leading firms are rapidly integrating globally, and it is more challenging to measure concentration worldwide than in a single national market.

One significant result of these changes is increasing foreign ownership of formerly U.S.-headquartered firms, sometimes with substantial foreign government support. Another is that firms have become dominant across industries previously separated in ownership, such as seed and agricultural chemical sales, or processing of beef and soybeans. This has been accompanied by rapid trends toward larger farms and a declining number of farms. In this section, we show consolidation in key livestock and crop sectors, as well as levels of concentration for key products and market channels in both the US and global arenas.

Agricultural Inputs and Data at the Global Level

There are approximately 2 million farmers in the US, but most of them buy inputs from a very small number of firms. These are the same firms that millions more farmers around the world increasingly rely on – especially for agrochemicals, animal pharmaceuticals, seeds, farm equipment and fertilizers. The leading firms and their global market shares are shown in the figure below. Four out of five of these input industries have a CR4 of over 40%, a level that may be conducive to price signaling when observed in national markets – but we emphasize that these firms are now dominant in *global* markets. National and more specific market segments may be even more concentrated, such as the two leading firms combining for 70% of corn and 61% of soybean seed sales in the US (Maisashvili et al. 2016), or the leading firm controlling more than half the sales of heavy tractors and combines in the U.S. (Horton and Kirchmeier 2020).

Recent changes in the agrochemical industry have reduced the number of dominant firms from six to just four, and ownership has changed from three U.S.-headquartered firms to just one. Since 2015, the U.S. firms Dow and DuPont merged and spun off an agriculture focused firm named Corteva, ChemChina acquired Syngenta (Switzerland), and Bayer (Germany) acquired Monsanto (U.S.) and divested some seed divisions to BASF (Germany). Note that all four of these remaining firms are also dominant in seeds – BASF is currently ranked the fifth largest in global seed sales.

Other inputs that farmers rely on include animal genetics from large seedstock banks used both by integrators and farmers breeding by artificial insemination. Although this industry is much smaller in comparison to those discussed above – approximately \$5 billion in annual sales – it is even more concentrated. Globally, just two firms control 99% of turkey genetics, 94% of laying hen genetics, and 91% of broiler genetics, and just three firms control 47% of swine genetics (ETC Group 2013; Shand and Wetter 2019). Two European firms, EW Group and Hendrix, are each among the top firms in three out of four of these species.

Global Market Concentration

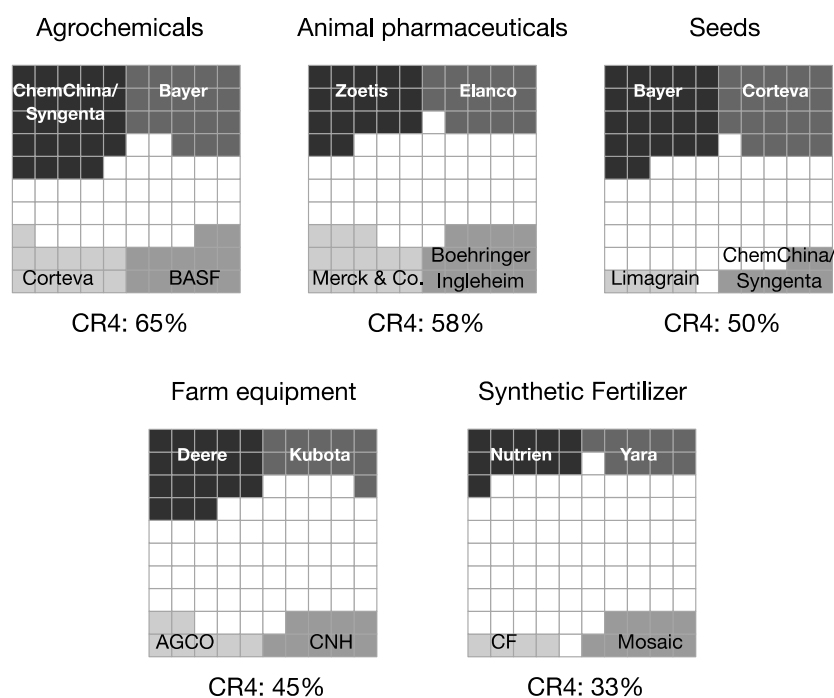

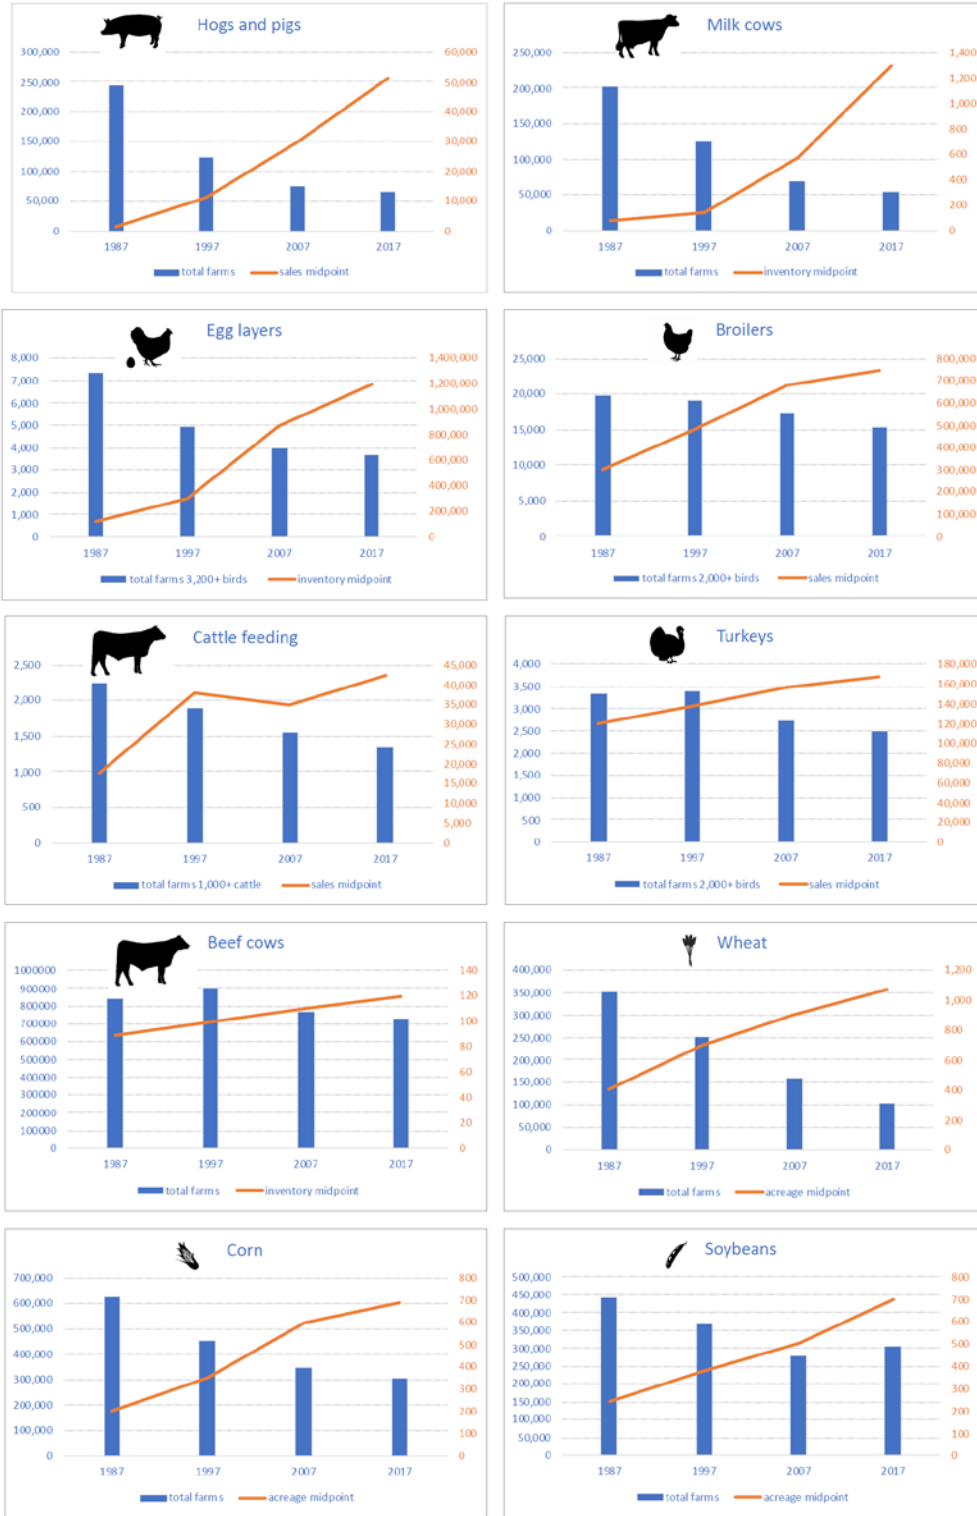

Figure 2: Global market concentration in selected agricultural inputs.

Farm Level and Producer Consolidation

The figure below indicates how consolidated agriculture has become at the farm level since the 1980s. The midpoint – where half of the farms have smaller numbers and half have larger numbers – has increased 50-fold for hog farms, and a median dairy farm is 16 times bigger in 2017 than in 1987. MacDonald et al. (2020) show that dairy has been consolidating at the farm level faster than any other sector in recent years, with the midpoint herd size increasing from 80 in 1987 to 1,300 in 2017. In crop farming, the share of acres in farms larger than 2,000 acres has more than doubled in 40 years, from 15% to 37%, while the midpoint for all crop farms stood at 1,445 acres in 2017, up from 650 acres in 1987 (MacDonald 2020). MacDonald further notes (p. 6), “Almost all of that expansion came at the expense of farms with 100–999 acres, whose share fell from 57% of cropland acres to 34% over thirty years. The net effect was that 85–90 million acres of cropland shifted out of the midsize class and into the largest acreage class over 1987–2017.”

Consolidation in U.S. Livestock and Crop Sectors, 1987 to 2017

Half of all animals are on farms with at least as many animals as the midpoint, and half are from farms no larger than the midpoint.

Half of all harvested crop acreage is on farms that harvest more, and half is on farms that harvest less

Data: USDA Census of Agriculture and MacDonald (2020). Author based midpoint calculations on confidential farm-level records from the USDA National Agricultural Statistics Service, Census of Agriculture Sales midpoint is number of head sold or removed, inventory midpoint is number of head in herd/flock.

Figure 3: Number of farms and mid-points of farm sizes for selected agricultural commodities.

These figures do not fully represent the scale of the very largest farms, such as dairies with 30,000 or more cows, and feed yards with 100,000 or more cattle. The top four cattle feeders have a total capacity of over 2.5 million head, as estimated from multiple sources, about 500,000 more than they had in *Cattle Buyer's Weekly* estimate in 2015.⁵ In addition, the four largest pork producers have between them nearly 1.8 million sows in the U.S..

Table 1: Largest U.S. Cattle on Feed Producers	One-time Capacity	Supplier to	
Five Rivers (Pinnacle Asset Management)	980,000	JBS ⁶	
Cactus Feeders	600,000 ⁷	N/A, possibly Tyson	
Friona Industries	577,000 ⁸	Cargill ⁹ and others	
Green Plains	355,000	Cargill ¹⁰	
<i>None of the 3 largest packers feed their own cattle outright after the sale of Fiver Rivers sale in 2018. Note that feedlots likely turn capacity twice per year, so 600,000 one-time capacity equates to about 1.2 million head per year. In 2015, Cattle Buyers Weekly pegged the 4 largest feeders as JBS Five Rivers, Cactus Feeders, Cargill and Friona, with a total capacity of 2.06 million.</i>			
Table 2: Largest U.S. Pork Producers	# Sows 2019	# Sows 2018	# Sows 2010
Smithfield Foods (WH Group)	930,000	950,000	876,804
Seaboard Farms	345,000	340,000	213,600
Pipestone System	282,000	251,000	140,000
Iowa Select Farms	242,500	235,000	157,500
<i>Source: Successful Farming Pork Powerhouses 2019 and 2010.</i>			

Processing and Trading

The largest firms may pick up and discard divisions like a game of trading cards, with a goal of becoming more dominant in specific markets. The figure below indicates the names of processing firms and their market shares for a number of key products. Some industries that were already highly concentrated decades ago, such as beef processing, have experienced ownership changes. This has resulted in two firms headquartered in Brazil – JBS and Marfrig – taking the first and fourth place in market share, respectively. Cargill remains in third place for beef and soybean processing, but sold its pork division to JBS in 2015 – due to its inability to move up from a fourth place position in this segment, according to some analysts.¹¹ Similarly, Tyson sold its chicken divisions in Brazil and Mexico to JBS in 2014, rather than trying to compete in markets where JBS had strong government support. These changes contributed to JBS

¹⁰ <https://www.drovers.com/article/cargill-exits-cattle-feeding-sells-two-yards>

¹¹ <https://www.nationalhogfarmer.com/marketing/cargill-jbs-deal-changes-pork-industry-landscape>

overtaking Tyson to become the world’s largest meat processor. Smithfield was once the largest processor in the pork segment, for both the U.S. and the world, until it was acquired by the WH Group in 2013 with backing from the government of China.

Beer is a rare industry that is experiencing decreasing concentration in the U.S., in part due to growing competition from craft breweries. The leading firm, Anheuser-Busch InBev (Belgium), has responded by acquiring 17 formerly independent craft breweries since 2011, although these ties are not indicated on the product labels (Howard 2018). The bread industry is consolidating quite rapidly via acquisitions, however, and the leading firm, Grupo Bimbo, is headquartered in Mexico.

Grain trading has long been dominated by just a few firms – ADM, Bunge, Cargill and Louis Dreyfus – but in recent years, the Chinese firm, COFCO, has joined their ranks. COFCO is China’s largest state-owned agrifood company (Belesky and Lawrence 2019). It has become the second largest global grain trader in just a few years, after acquiring firms in the Netherlands and Hong Kong, and surpassing Dreyfus, Bunge and ADM.

Retail and Distribution

The supermarket industry rapidly consolidated beginning in the late 1990s. These trends for convenience stores and food distributors have accelerated more recently. The top firms have been very active in making acquisitions, such as 7-Eleven’s purchase of 3,900 stores from Speedway in 2020 and Sysco acquiring half a dozen other distributors in 2019. Some newer forays from retailers include backward integration up the supply chain, particularly in dairy and meat processing.¹² Kroger, which has long been vertically integrated, may produce up to 90% of fresh milk for its stores, and even sells some of its supply to a competitor, Food Lion.¹³ While food retailers have long sold private-label grocery brands, these moves may represent something different. Walmart has moved into integrating dairy and beef processing, developing its own supply chain for Angus beef, which includes partnering with Creekstone Farms in Kansas for slaughter and FPL Foods in Georgia for packing.¹⁴ Costco, the third largest food retailer, set up their own poultry production and processing operation in

Common Ownership Across Products and Market Channels

Asset management firms are increasing their shares in multiple firms in the same sector, and this “common ownership” or “horizontal shareholding,” in markets that are already highly concentrated, may further reduce incentives to compete (Clapp 2019, Clapp & Purugganan 2020). BlackRock and Vanguard, for example, both own significant shares in at least five dominant firms in both meat and dairy processing, as well as all three leading soft drink firms, and all three leading cold cereal firms.

¹² Howard (2016) documents that Kroger controlled 20 % or more of the milk supply in the St. Louis area by 1968.

Impacts on Farmers, Workers, Communities and the Environment

The concentration and consolidation we have broadly outlined has often been justified on the basis of efficiency, despite failing to incorporate an enormous number of social, economic and ecological externalities when calculating such measures. Nearly 50 years ago, in a series entitled “Who Will Control Agriculture?,” agricultural economists Briemyer, Guither and Sundquist (1973) warned that the changing organization of agriculture did not enhance the efficiency or productivity of the system and would exact social and psychological costs on farmers and society. In addition, some recent studies have failed to measure efficiency gains (nor price reductions) from consolidation in manufacturing (Blonigen and Pierce 2016). Defenders of the current monopolized system cite that consumer welfare has not been harmed,¹⁷ yet consumer prices are “sticky,” rising when costs for powerful processors and retailers increase, but less likely to fall when prices paid to farmers decrease (Shields 2010). Recently, a number of lawsuits point to multiple cases of price-fixing, including in tuna, and allegedly in chicken, beef and pork.¹⁸ For those of us concerned with resilience, efficiency has often been the enemy of redundancy, which can provide fail-safe mechanisms, making systems more resilient. Here we present two cases – the meat industry and the widespread problems with the herbicide dicamba – to illustrate the fragility and interconnectedness of the dominant agrifood system.

The Meat Industry

Nowhere is this systemic vulnerability clearer than in the protein sector, which has been hard hit by the COVID-19 crisis, particularly in North America. Meat production, processing and consumption have risen steadily in recent years, part of the “meatification” of global society (Weis 2015; Winders and Ransom 2019). Increased meat consumption is a central component of the industrial diet developed in the United States (Winson 2013) and diffused globally, contributing to obesity epidemics throughout the world (Otero 2018). The feed/meat complex has developed with concerted cooperation between state and market actors through various subsidies and pro-business regulations (Howard 2019). Meatification, primarily the feed/cattle complex, is also a major contributor to greenhouse gas emissions (IPCC 2018). Meat processing is one of the most dangerous jobs in the United States, especially hazardous for immigrant groups with limited English-speaking skills and sometimes precarious legal status (GAO 2005; Choi and Constance 2019; Human Rights Watch 2005). The “chickenization” of the red meat industry has restructured meatpacking from a dangerous, but good paying, blue-collar, union job dominated by white males to an even more precarious working-class, non-union job, often staffed by marginalized female, immigrant, and refugee groups (Freshour 2019; Schwartzmann

¹⁷ Dorsey et al (2020 p. 862) are perhaps the latest to argue that “the elegant ‘consumer welfare standard’ ... offers a rigorous, objective, and evidence-based framework for antitrust analysis.”

¹⁸ See summary of alleged price-fixing of pork at https://thefern.org/ag_insider/more-antitrust-lawsuits-hit-the-meat-industry-this-time-its-pork/, chicken at <https://www.porkbusiness.com/article/three-poultry-execs-plead-not-guilty-price-fixing>, and beef at <https://www.agriculture.com/livestock/cattle/lawsuits-allege-price-fixing-by-big-beef-companies>. The most recent case is a lawsuit by restaurant chain Bob Evans alleging price-fixing in poultry: <https://www.meatingplace.com/Industry/News/Details/94274>.

2013; Stull 2019; Stull and Broadway 2005). Finally, “chickenization” is also restructuring the protein production sector away from open markets to contract farming, as captive supplies in beef (see Table 1) and contracting in pork further marginalize producers.

This protein sector clearly illustrates the complex interconnectedness of one industry. Recently, this sector revealed how worker vulnerabilities triggered by COVID-19 created crises in worker welfare, animal welfare and farmer livelihoods during the pandemic. In our consolidated farm and food system, farmers, workers and the environment are interconnected, meaning that when problems hit one part, they quickly engulf others. For meatpacking, the coronavirus hit workers, and a supply chain focused on efficiency quickly broke down. Below we focus on the impacts to workers, farmers and the environment of this one massive disruption that is a wake-up call to redesign the system.

Labor: According to reporting by Leah Douglas at the Food and Environment Reporting Network, over 40,500 workers in 417 meatpacking plants had tested positive for COVID-19 by mid-August, and 189 meatpacking have died from it (see Figure 5). Transmission of COVID-19 among workers has been rapid and difficult to control in almost all large-scale poultry, pork and beef processing plants in N. America, Europe and Latin America. For instance, the Centers for Disease Control (CDC) reported that in 14 states, 9% of meat and poultry processing workers were diagnosed with COVID-19 by the end of May. Close working conditions for long time periods, shared transportation to work, and shared (congregate) housing were highlighted by the CDC as potential causes. When industry CEOs such as Don Tyson warned of a meat supply crisis due to plant shutdowns, President Trump issued an executive order that declared meatpacking plants to be “critical infrastructure” under the Defense Production Act and prohibited their closure by state health authorities.¹⁹

Farmers/Animal Welfare: By mid-April, nearly 20 percent of daily pork processing capacity had been idled by COVID-19, with similar problems in beef processing.²⁰ An early outbreak at a Smithfield Foods plant in S. Dakota shut down a plant responsible for 5 percent of the nation’s daily pork slaughter.²¹ When a plant that processes nearly 20,000 animals a day closes, it creates

Covid-19 cases by company

Figure 5: Counts as of August 12, 2020 by Leah Douglas, Food and Environment Reporting Network Accessed at: <https://thefern.org/2020/04/mapping-covid-19-in-meat-and-food-processing-plants/>

²¹ <https://www.meatingplace.com/Industry/News/Details/91490>

crises for farmers supplying that plant. They must either feed those animals, find an alternative market or euthanize them. Alternative markets for 20,000 pigs per day are difficult to find, even outside a pandemic situation. One agriculture press article estimated that nearly a million pigs had disappeared from slaughter markets in the second quarter of the year, with anywhere from 300,000 to 800,000 pigs euthanized.²² At the low estimate, that's nearly 29,000 tons of pork destroyed.²³ At least 2 million chickens were also euthanized by mid-May.²⁴ Previous mass euthanizations occurred in the wake of livestock disease epidemics, such as porcine diarrhea virus epidemic in 2013 and avian influenza in 2015. The genetic uniformity of these animals contributed to their susceptibility—globally just one breed accounts more than 99% of turkeys, for example, and in the U.S. more than 85% of dairy cows belong to the Holstein breed. Mass euthanasia of healthy, marketable livestock has undoubtedly caused emotional trauma for farmers, and all of us can lament the tremendous loss of life and natural resources embodied in the once living animals. The wastefulness of a system with few fail-safe mechanisms is astounding. It also clearly illustrates that our agrifood system more heavily emphasizes relations of power rather than feeding people.

Food, Feed and the Environment: Meat production at this scale requires enormous amounts of corn and soybeans, two of the seven so-called “program crops” that have historically been heavily subsidized by the U.S. Farm Bill, both through direct payments and subsidized crop insurance (Starmer and Wise 2007; see also Congressional Research Service 2018).²⁵ Howard (2019) argues that firms like Tyson, Smithfield and JBS were able to consolidate due to low feed costs, made possible by direct and disaster payments that kept row-crop farmers producing even though market prices did not cover their costs. Most of the best soil in the U.S. is devoted to the production of corn and soybeans.²⁶ In 2018-2019, just under 40% of the U.S. corn crop was used for feed²⁷ - some of which those hogs and chickens ate before they were euthanized.²⁸ The corn-soy rotation that covers much of Corn Belt, contributed to the Heartland region having the lowest diversity in seven of the eight USDA census years between 1978 and 2012 (Aguilar et al. 2015).²⁹ Monocultures negatively impact the provision of ecosystem services and biodiversity through simplifying the ecosystem and by requiring higher production inputs (Klasen et al. 2016). Corn and soybeans become the de facto crop rotation across large portions of the Corn Belt, with associated soil erosion that was estimated to cost Iowa farmers \$1 billion per year (Eller 2014). Soil erosion costs the entire U.S. over \$44 billion per year, including \$100 million

²² <https://www.agri-pulse.com/articles/14018-number-of-hogs-euthanized-due-to-covid-19-impacts-still-unknown>

²³ We calculated 300,000 hogs at market weight of 275 pounds, dressing out at a minimum of 70%.

²⁴ <https://www.theguardian.com/environment/2020/may/19/millions-of-us-farm-animals-to-be-culled-by-suffocation-drowning-and-shooting-coronavirus>

²⁵ “From 2007 to 2016, the total net cost of the federal crop insurance program was about \$72 billion” of which 60% went direction to producers and 39% went to private insurers (Congressional Research Service 2018)

²⁶ <https://www.ers.usda.gov/topics/crops/corn-and-other-feedgrains/feedgrains-sector-at-a-glance/>

²⁷ <https://www.fapri.missouri.edu/wp-content/uploads/2020/06/2020-June-Update.pdf>

²⁸ If 300,000 market-weight pigs (275 pounds each) were euthanized, using feed rations from Iowa State Hog Market Ag Decision Maker, that would represent 3.4 million bushels of corn fed, or about .024% of 2018-19 US corn production, using FAPRI figures.

²⁹ The Heartland region as defined by USDA encompasses all of the states of Ohio, Indiana, Illinois and Iowa, most of Missouri, and portions of eastern Nebraska and South Dakota, southern Minnesota, and southwestern Kentucky (Aguilar et al. 2015).

in lost farm income.³⁰ The washing away of nitrogen and phosphorus fertilizers in top soil contributes to hypoxia, such as the Dead Zone in the Gulf of Mexico.³¹ A renewed interest in soil health has led to increased use of cover crops and reduced tillage which can alleviate these problems, but still fewer farmers on the land farming larger acreages make the labor and timing of such practices challenging (Hendrickson 2019). Few if any markets exist for diversified crops and livestock meaning crop rotations are limited (Roesch-McNally et al. 2018).

Dicamba Debacle: “[T]he herbicide for which [Mike] Wallace literally gave his life”³²

Dicamba, registered as an herbicide in 1967 and available in 1,000 products in the U.S.,³³ has recently pitted farmer against farmer and farmer against community, as well as given “all of agriculture a black eye”³⁴ in the words of one weed scientist. In the five years since Monsanto’s (now Bayer’s) Xtend dicamba resistant soybeans were approved, all of the large agrochemical-seed firms have introduced dicamba-tolerant seeds, including ChemChina, Corteva, BASF and Bayer.³⁵ In the same time period, the Heartland has witnessed one related murder,³⁶ thousands of dollars of uncompensated off-target injuries and failure of institutions to combat the power of agriculture firms.

Power Play: In 2015, Monsanto’s Xtend (dicamba-glyphosate tolerant) soybeans were approved for the 2016 planting season, even though the accompanying less volatile formulation of dicamba was not approved.³⁷ Thus the dicamba formulation available in 2016 was not allowed for “in-crop” use as it was volatile and could easily drift. Monsanto continued to sell these beans, and seemed to blame farmers when some “tried using older formulations of dicamba and the off target movement was very bad.”³⁸ Indeed, court documents in a peach grower’s lawsuit against Bayer and BASF suggest that the companies “created circumstances that damaged millions of

³⁰ The \$44 billion per year includes lost productivity, along with sedimentation and eutrophication of water reservoirs according <https://www.farmprogress.com/soil-health/high-cost-soil-erosion>. Sartori et al. (2019) estimated the global costs of soil erosion due to water at \$8 billion annually, reducing global food production by 33.7 million tonnes and raising prices by up to 3.5%.

³¹ In 2017, the Dead Zone, an area of low or no oxygen that kills aquatic life, was 8,776 square miles. Measurements in 2020 were disrupted by Hurricane Hanna. <https://www.noaa.gov/media-release/smaller-than-expected-gulf-of-mexico-dead-zone-measured>

acres of crops by dicamba in order to increase profits from a set of new dicamba-related products offered for sale beginning in 2015.”³⁹

By 2017, the new formulations of dicamba had been approved so farmers could plant dicamba-tolerant soybeans and legally use dicamba to control weeds in mid-summer. Still dicamba damage continued. There were reports of so-called defensive planting, whereby farmers protected themselves from neighboring farmers’ use of dicamba by planting Xtend or other dicamba tolerant soybeans⁴⁰ – especially if the price was not substantially different than other traited seeds.⁴¹

While dicamba resistant soybeans were widely planted from 2017-2020, – largely because of resistant weeds like waterhemp and Palmer amaranth, problems with dicamba use remained. Weed scientists at the University of Missouri detailed potential problems with volatility even with new formulations.⁴² In February, 2020 a jury awarded Bader Farms, a peach orchard, \$15 million in compensation for damages from off-target dicamba drift, and awarded over \$200 million more in punitive damages.⁴³ In June, the agriculture community was stunned when a federal court ruled that EPA’s approval of reformulated dicamba (XtendiMax, Engenia and FeXapan) in use on “an estimated 60 million acres of soybeans and cotton [was] vacated – or ended – effective immediately.”⁴⁴ Farmers could apply any existing stocks of those herbicides through July 31, 2020.⁴⁵

Distribution of Estimated 3.6 Million Acres of Dicamba-injured Soybeans
Reported by University Weed Scientists in Thousands of Acres as of October 15, 2017

Adapted from Dr. Kevin Bradley, University of Missouri

Environmental Consequences of Corporate Actions: To understand the problems with dicamba, Howard and Hubbard (2020) trace changes in the seed industry, with historic seed firms first being acquired in the 1970s by oil and grain trading companies, and then by agrochemical companies in the 1990s. The latter was spurred by slowing rates of growth in agrochemical sales largely due to environmental concerns. Then came herbicide-tolerant crops, starting with the introduction of Monsanto’s Round-Up Ready soybeans in 1996. Agrochemical-seed firms could now bundle seeds and chemicals, which could keep farmers dependent upon one firm for these inputs (James, Hendrickson and Howard, 2013).

The herbicide dicamba has been in use since the 1960s, primarily in corn production, but tensions exploded in 2016. Why? Monocropping in cotton, corn, and soybeans have created a plethora of herbicide-resistant weeds⁴⁶ that have occurred since the introduction of Round-Up Ready seeds. Dicamba-tolerant, as well as 2,4-D tolerant seeds, were seen as an urgently needed solution. As Missouri weed scientist Kevin Bradley notes, dicamba became a problem for two reasons: farmers spray more to combat weeds such as herbicide resistant pigweed (*Amaranthus palmeri*), which we note thrives particularly well in a rapidly changing climate; and dicamba is being used later in the season, which makes it vulnerable to drift due to hot and humid conditions.⁴⁷

This overreliance on one single weed management tool – herbicides – alarmed soil scientists who argue that soil conservation gains are threatened by the tillage desperate farmers use to control weeds, and called for an “integrated weed management” approach (CAST 2012).

Community Impact: The volatility of dicamba has pitted neighbor against neighbor in rural communities. The most poignant, of course, is the murder of Mike Wallace by his farming neighbor’s employee, Curtis Jones, over dicamba drift damage to an estimated 40% of Wallace’s crops. In the months after this murder, Wallace’s family worked to get a permanent ban on dicamba, “a quest that has put Wallace’s family at odds with many of their neighbors.”⁴⁸ Others acknowledge the potential community problems, as this Arkansas farmer said in 2017, “We’re trespassing on our neighbors, and we’re trespassing on our neighbors in town. It’s not just our neighbor farmers. There’s a lot of damage in yards. You hate to say that and call attention to it, but it is a reality.”⁴⁹

In 2018, just two years after dicamba tolerant beans were introduced, an investigation by the agricultural news service DTNPF on community impacts of dicamba drift exposed the destruction of a South Dakota CSA farm’s crops, a Tennessee rural resort struggling to save gardens and trees, and an Illinois homeowner who spent at least \$10,000 investigating damage from dicamba on her “carefully landscaped yard.”⁵⁰ In all these cases, individuals – in the first two instances, consumers and farmers attempting to build agrifood alternatives – were blind-sided by the constrained choices of conventional farmers (e.g. Hendrickson and James 2005). In essence, the rights of rural community members to make choices about their livelihoods or even

⁴⁶ There are 514 unique cases of herbicide resistant weeds globally, involving 262 species, in 93 crops in 70 countries: <http://www.weedscience.org/Home.aspx>

⁴⁷ <https://www.harvestpublicmedia.org/post/dicamba-has-been-around-years-why-would-it-now-be-causing-problems> and <https://ipm.missouri.edu/MPG/2017/11/dicamba/>

⁴⁸ <https://arktimes.com/news/cover-stories/2017/08/10/farmer-vs-farmer>

⁴⁹ <https://arktimes.com/news/cover-stories/2017/08/10/farmer-vs-farmer>

⁵⁰ <https://www.dtnpf.com/agriculture/web/ag/crops/article/2018/07/20/dicamba-moves-beyond-bean-fields-eye>

their enjoyment of rural properties is usurped by the right of dominant agrifood companies to profit or of conventional row-crop farmers to control weeds.⁵¹ Perhaps the situation is best summed up by a Missouri farmer interviewed in 2019 (James et al. 2020): “With Dicamba, you can do everything right and it can still move around and damage the neighbor’s orchard or the garden of the lady down the road....morally, can you spray a product that you have no control over once it leaves the boom tip and you have to rely on Mother Nature to keep it where it's at and you damage someone else's crop?”

Failure of Institutions: The power of these dominant firms is also demonstrated by the failure of the EPA and state agencies to regulate dicamba, and the struggle by universities to provide accurate information about its use. University weed scientists were caught off-guard as dicamba related injuries accumulated in 2016 and 2017.⁵² Some state agencies have been in the cross-hairs between corporate power, desperate farmers and community concerns. For instance, after the Arkansas Plant Board restricted use of dicamba-based herbicides in 2016 and 2017, Monsanto sued the board “arguing that the 2016 rule had effectively prohibited in-crop use of XtendiMax in 2017, and that the 2017 rule would effectively prohibit in-crop use of XtendiMax in 2018.” At the same time, farmers also sued the board after it set an early April, 2018 cut-off date for spraying dicamba instead of the May 25 date.⁵³

Other state agencies responsible for regulating herbicides issued and rescinded bans limiting use at certain times,⁵⁴ and pleaded with EPA to ban post-emergent use when reregistering the chemical.⁵⁵ States were flooded with damage reports,⁵⁶ even though some farmers felt state agencies were reluctant to investigate and even discouraged reports.⁵⁷ The federal judiciary stepped in, vacating EPA’s approval of three specially formulated herbicides in the middle of the 2020 growing season.⁵⁸

Farmer and Community Impacts

Both of these cases serve as illustrations for the impacts of concentration in the food system across multiple, global scales. As Hendrickson (2015) argues, a consolidated system constrains the ability of farmers to manage their farms using agroecology, which requires diversity and redundancy, rather than specialization and efficiency. In *Too Big to Feed*, the International Panel of Experts on Sustainable Food Systems (IPES-Food 2017)⁵⁹ argued that agrifood consolidation

⁵¹ Ashwood et al (2019) show how Right-to-Farm laws prioritize the right to profit from property over other rights such as the right to sustenance or the right to heritage. In addition, Ashwood (2018) explores how government enforcement of the right to profit has undermined democracy in rural communities.

⁵⁹ One of the authors, Philip Howard, is a member of this panel. The report is available at http://www.ipes-food.org/_img/upload/files/Concentration_FullReport.pdf.

reduces farmer autonomy and redistributes costs and benefits across the food chain, thereby squeezing farmer incomes. The table below illustrates this squeeze. One can see that the *median* net farm income for intermediate farms, those grossing less than \$350,000 and for which one of the operators considers farming an occupation, was -\$1,524 in 2018.

Table 3: Principal farm operator household finances, by ERS farm typology, 2018

Item	Residence Farms	Intermediate Farms	Commercial Farms	All Farms
Number of farms	1,069,497	742,931	166,940	1,979,368
Income, median dollars per household				
Farm income	-2,610	-1,524	141,614	-1,735
Off-farm income	90,559	46,483	41,000	65,841
Earned Income	74,305	7,910	17,500	37,500
Unearned Income	14,000	25,310	5,000	20,404
Total household income	88,220	50,097	195,254	72,481

Source: USDA-ERS. Residence farms are those where the operator is retired or has another occupation. Intermediate farms have at least one operator who spends 50% or more of work time farming and have agricultural sales <\$350,000. Commercial farms are the same except have agricultural sales >\$350,000.

As we have described, the agrifood system is a set of power relationships with dominant agrifood firms leveraging their power over farmers, workers and communities in producing, manufacturing and retailing food. This can have particular impacts on farmers, workers and communities of color. Johnson Gaither (2016) outlines how heirs’ property⁶⁰ can affect how Black property owners, as well as heirs of Native American fractionated allotments and Texas *colonias*, are able to engage with government agriculture and land programs. Due to unclear titles or multiple heirs, farmers of color may also face displacement through land partition or tax sales (Dyer and Bailey 2008). This puts them specifically at risk of losing their farms through land consolidation, particularly as cultural rights and/or the right to sustenance are mostly superseded by the right to profit in current application of property rights (Ashwood, Diamond and Walker 2019). Farmers of color have also been historically locked out of conventional agricultural markets, leading them to forge alternative market arrangements – like cooperatives⁶¹ – that can be vulnerable to dominant trading or supermarket firms.

⁶⁰ Gaither defines it as, “inherited land or real estate owned by two or more people as tenants in common” usually arising from a lack of a will or outside a formal probate process. Gaither summarizes legal scholarship that notes Native Americans, who were often compelled to lease their land to Whites, did not consider land as a commodity which constrained their ability to participate in White notions of free markets.

⁶¹ See Federation of Southern Cooperatives <https://www.federation.coop/> and also <https://www.wealthworks.org/success-stories/new-mexico-cooperatives>.

Farmers and consumers frequently have far fewer options in the market than it appears. Farmers Business Network,⁶² for example, notes that "Seed companies routinely label the same seeds under multiple brands with dramatically different prices." Recalls have illustrated the hidden yet widespread practice of contract packing, with identical foods from a single processing plant sold under as many as forty different brands, including those that appear to be direct competitors (DeLind and Howard 2008).

The IPES-Food (2017, p. 77) also argued that agrifood consolidation was "narrowing the scope of innovation," controlling information through a focus on big data, allowing labor abuses and fraud, and hollowing out corporate commitments to sustainability. IPES expressed concerns about increased environmental and public health risk – which were prescient as the pandemic has shown. Other scholars such as Drake (2013, p. 1083) detailed how non-white "communities across the United States disproportionately bear the burden of pollution by big agriculture" through exposure to excessive pesticide use and location of large-scale animal operations, thereby linking consolidation in the agrifood systems with civil rights.

As was illustrated with the dicamba debacle and meat industry consolidation, there are important community level impacts of consolidation in agriculture and food. Dicamba has divided rural communities, while the labor strategies of big meat have exacerbated impacts of immigration on communities, particularly in the Midwest. In their meta-analysis on the relationship between agricultural structure and community well-being, Lobao and Stofferahn (2007) found detrimental effects of industrialized farming on communities were reported in 82% of 51 studies. These negative effects included greater income inequality or poverty; decreased retail trade and diversity of retail firms; population declines; and negative health effects of large livestock operations. Gibson and Gray (2019) show how a consolidated agriculture "without people" has depopulated Western Kansas with an accompanying collapse of social relationships. A recent New Yorker article provides the human face of these effects, examining the unhappy fate of dairy farmers across a very productive region of Wisconsin, due to the rapidly changing structure of their industry, which has seen the elimination of many smaller (less than 300 cows) herds.⁶³ Such changes have social and political ramifications as rural areas depopulate, challenging the ability of rural communities to provide essential services and invest in businesses and infrastructure (Peters 2019).⁶⁴

Possibilities for Democratizing the Food System

Our aim in this report was to document current conditions of consolidation within the agrifood system and to frame the social and ecological consequences of such a system. We are concerned that the relationships of power currently exhibited within the agrifood system have significant negative impacts on farmer livelihoods and autonomy, particularly for less powerful members of

⁶² <https://use.farmersbusinessnetwork.com/seed-relabeling-report-2018/>

⁶³ <https://www.newyorker.com/magazine/2020/08/17/how-suffering-farmers-may-determine-trumps-fate>

⁶⁴ According to Peters research, of the 70% of non-metro counties that lost population since 2010, most were concentrated in the Great Plains and Midwest – the Heartland region that provides corn and soy. Some scholars at Iowa State, including D. Peters, have tried to help Iowa communities manage these processes through "smart shrinkage." <https://www.news.iastate.edu/news/2018/10/31/shrink-smart>

society, especially those who are systemically discriminated against and exploited based on race, gender, queer identity, ethnicity, or nationality. Centralizing food system decisions about what is produced, where, how and by whom damages farmers' abilities to treat their farms as specific agroecosystems and constrains their choices by determining what they can produce for what markets. In response to continued consolidation in agrifood, rural communities in some agricultural areas have depopulated, collapsing social relationships, while in others, relationships, livelihoods and property have been damaged by the choices of some farmers caught in a treadmill of monocropping. Vulnerable workers have been sacrificed to injury and illness, and serious questions arise about the social and ecological resilience of such systems in the face of climate change and societal turmoil.

At the heart of this analysis is a focus on power – both economic and political. Ultimately American political democracy rests on economic democracy and vice versa (Wu 2018). Thus, our laser focus in scholarship, praxis and policy must be on democratizing the agrifood system through a multitude of strategies at local, state, regional and national scales.

What would democratizing the food system look like? We already see a plethora of emerging alternatives from Community Supported Agriculture farms that intimately share risks and rewards with consumers to farmer cooperatives, urban agriculture farms, garden-based education, commons-based land ownership, fair trade or building values-based value chains that serve local and regional food systems. All of these in some way are attempting to reshape relationships of power within the food system. Full spectrums of innovations must be encouraged without cooptation or blocking by those whose power may be relatively diminished. This will only be achieved with an accountable, and truly democratic government, which has yet to be fully realized.

What is missing is analysis and action on policy that can be immediately deployed to reshape power relationships in agriculture and food. It is not our intent – nor our expertise – to offer fully formed policy solutions here. Rather we believe that democratizing food and agriculture will take policy-makers, farmers, workers and communities working together to fashion alternatives and policies that can help to:

- 1) Curb and prevent monopolistic tendencies in agrifood systems within all sectors and at all scales through diverse policy instruments from contract to competition law, including all titles of the Farm Bill.
- 2) Shine a racial lens in scholarship on agrifood system power and consolidation that highlight the myriad ways that economic power has often been built within and upon other relationships of power, providing new insights into potential remedies.
- 3) Adopt a stance prioritizing resilience and redundancy in business arrangements as well as policies.
- 4) Rethink core assumptions such as efficiency and property rights in ways that acknowledge their social and ecological consequences.
- 5) Encourage the development of alternative production and consumption arrangements that root producers and consumers in place, offer producers and consumers more choices at

different scales, afford more opportunities for communities to develop self-reliance, and reduce society's dependence on dominant agrifood firms.

- 6) Rethink what kinds of crops, livestock and even sectors of the food system are subsidized, and how they are subsidized, in a transparent iterative process that allows citizens to truly weigh their benefits and consequences.

To transform our agrifood system from one that is monopolized and brittle to one that is democratic, equitable, ecological and resilient will take many solutions and experiments across all scales and sectors of food production and consumption. We hope that we have contributed to this process by providing a framework for seeing and understanding the social and economic organization of the agrifood system.

Food Security and Community Resilience Resources

Prepared by the Interdisciplinary Center for Food Security, University of Missouri
Dr. Mary Hendrickson, Associate Professor and Bill McKelvey, Senior Project Coordinator

Web: <http://foodsecurity.missouri.edu>

Contact: Dr. Mary Hendrickson, HendricksonM@missouri.edu, 573-882-7463

Missouri Hunger Atlas

The Missouri Hunger Atlas visually engages readers to better understand hunger in Missouri. Through a series of indicator maps and tables, the Atlas details the extent of food insecurity in all 114 Missouri counties and the city of St. Louis. The Atlas also assesses the performance of a host of public and private programs intended to help people struggling with hunger.

Web: <https://foodsecurity.missouri.edu/missouri-hunger-atlas/>

Food Pantry Research

The center conducts a variety of research involving food pantries. Projects explore the characteristics of food pantries, looking at how they are organized and operated. Other research explores the household characteristics, health, and coping strategies of those who use food pantries. In the summer of 2021, we concluded data collection for a multi-state (Missouri, Kansas, & parts of Illinois) study involving agencies and clients and plan to make that data available by early 2022.

Web: <https://foodsecurity.missouri.edu/food-pantry-research/>

Missouri EATs

In partnership with communities across the state, Missouri EATs helps connect local stakeholders to build and strengthen their community's food system. Missouri EATs is a community development process designed to **engage** people to identify local assets and needs; help them develop a plan to **act** on their top priorities; and make lasting changes to **transform** their local food system. Missouri EATs is a creation of the Interdisciplinary Center for Food Security and MU Extension Community Economic Development Food Systems Team. It is adapted with permission from the Oregon Food Bank's FEAST program.

“Local Is Delicious,” But It’s Not Always Easy:

A Case Study of the Western Montana Growers Cooperative

**A community-based action research project of the
Environmental Studies Program, University of Montana,
in partnership with the
Western Montana Growers Cooperative
& Mission Mountain Food Enterprise Center**

November 2013

This research emerged from a graduate workshop offered through the Environmental Studies Program at the University of Montana during Fall 2012. Sixteen students and Professor Neva Hassanein carried out this multi-dimensional case study of the Western Montana Growers Cooperative. Such community-based action research allows students to contribute to building our regional food system and to learn by doing.

The researchers and authors of this report are:

Elizabeth Costello	Neva Hassanein	Rachel Mockler

DEDICATION

Jane Kile (1954-2010) was a pioneer in Montana's organic and community-based agriculture movements. She committed herself to conserving wild lands; supporting sustainable forestry, farming and ranching; and creating stable, self-sufficient rural communities. Jane was instrumental in the formation of the Western Montana Growers Cooperative. This report is dedicated to her memory and inspiration, which live on.

ACKNOWLEDGEMENTS

The UM Environmental Studies Program gratefully acknowledges our community partners for their support and interest in the project and in students' learning. For financial support and helpful guidance, we thank Jan Tusick, Karl Sutton, and the rest of **Mission Mountain Food Enterprise Center**, a Division of the Lake County Community Development Corporation, as well as Rural Cooperative Development of the United States Department of Agriculture. We are especially grateful to the **Western Montana Growers Cooperative** (WMGC) for its willingness to provide input on the research and share information vital to this research, especially Dave Prather and the WMGC Board of Directors.

EXPLORING A FOOD HUB IN THE NORTHERN ROCKIES

Neva Hassanein and Laura Ginsburg

Introduction

With deep roots in the movement for sustainable agriculture and community-based food systems, the Western Montana Growers Cooperative (WMGC) formed in 2003. This agricultural marketing cooperative aggregates, processes, markets, and distributes products at a regional scale for its grower members. Using the tag line “local is delicious,” the WMGC serves wholesale markets (e.g., grocers, restaurants, institutions) and their own community supported agriculture (CSA) program. The business’ formation and the key partnerships involved reflect what many scholars and practitioners have increasingly recognized while working to promote local and regional food systems in Montana and elsewhere. That is, in order for such food systems to flourish, infrastructure and marketing channels supporting short, values-based supply chains must be developed, scaled appropriately, and sustained over time.¹

The new term “food hub” and the attention being given to the concept reflect this systems orientation and interest in intermediated local/regional markets.² While food hubs may serve a variety of economic and social functions, they are most simply understood as businesses or organizations that actively manage the aggregation, processing, marketing, and/or distribution of local and regional food products. Aggregation refers to the combining of products sourced from multiple growers, and marketing and distribution networks typically retain some level of source identity with sales to wholesale markets.³ Food hubs have adopted various legal structures, including privately held businesses, non-profit organizations, and cooperatives. Cooperative businesses constitute about 21% of the 168 food hubs identified by the United States Department of Agriculture (USDA).⁴

Continuing a long tradition of organized opposition to the concentration of economic power in agriculture, farmer cooperatives have strong potential as a vehicle for empowerment and solidarity.⁵ As member-owned and controlled businesses, the democratic form of cooperatives creates an opportunity for the emergence of a shared identity around goals and values. In the case of food hubs, that collective identity seems likely to be constituted around the goal of and values associated with building a food system grounded in a particular place and network of relationships. In turn, the infusion of cooperative principles into food hubs might reinforce the development of values-based supply chains, which generate economic value *and* advance particular social, economic, or environmental values.

This report presents the results of a community-based action research project (CBAR) about one particular food hub, the WMGC, and its role in a local and regional food system in the Northern Rockies. Geographic factors certainly contributed to a strong practical interest among producers, economic development professionals, and other food system actors in developing this food hub. Montana's geography is roughly defined by the Continental Divide, which splits the western one-third and the eastern two-thirds of this vast state – the nation's fourth largest in area (see Map 1). With just over a million people, Montana is ranked 48th out of the 50 states in terms of population density. The vast majority of the growers in the WMGC (36 in 2011) are located west of the Continental Divide, especially in Flathead, Lake, Missoula, Ravalli, and Sanders Counties (see Map 2). Montana's cities and, therefore, larger markets are spread apart geographically. These include Missoula, Kalispell, and smaller towns around Western Montana, as well as points east, including the cities of Helena and Butte, Bozeman, and even Billings in Eastern Montana. The northern latitude and shorter growing season have logically led to partnerships to meet demand during winter through processing and storage facilities. Despite the fact that Montana is sparsely populated – or perhaps because of it – there are strong social and economic networks among those working on various alternative food and agriculture initiatives.

Collaborative Research Approach

In conventional research, so-called “experts” decide on the issue to be studied, and mainly present their findings to other scholars. By contrast, CBAR aims to systematically answer questions in collaboration with community partners affected by the issue being studied and for the purpose of effecting change in some way.⁶ The process rests upon strong relationships between the researcher(s) and the community or organization. In this case, for over a decade, Neva Hassanein, Professor of Environmental Studies at the University of Montana (UM), has worked in a variety of capacities with organizational, governmental, and individual actors engaged in efforts to transform the food system. As a result of those relationships, this project emerged from conversations among UM researchers, staff and board members of the WMGC, and staff from the Mission Mountain Food Enterprise Center (MMFEC) of Lake County Community Development Corporation (LCCDC).

During a graduate-level course at the UM during late 2012, a research team of 16 students and Hassanein carried out this multi-dimensional case study about the WMGC. In the spirit of CBAR, UM researchers met several times with our community partners to determine the scope of the project. The WMGC board and staff generated ideas for specific research questions, emphasizing interest in learning more about the perspectives of their members and their customers. The Cooperative Development Center at LCCDC was instrumental in creating the WMGC; therefore, their staff was particularly interested in a comprehensive case study, wanting to be able to tell the story of how the Cooperative functions in the emerging local and regional food system. With funds from Rural Development at USDA, LCCDC provided financial support for the project. Specific objectives included:

- To describe and analyze the structure and function of the WMGC and its role in the regional food economy;
- To explore the values-based supply chains associated with the Cooperative; and
- To learn about what is working well and what might be improved.

The research presented here not only answers questions of interest to the Cooperative and its partners, but also contributes to a general understanding of small-scale cooperatives operating as food hubs, values-based supply chains, and the possibilities and challenges associated with building a more democratic, regional food system in a large rural area.

⁶ Stoecker, R. (2005). *Research Methods for Community Change: A Project-Based Approach*. Thousand Oaks, CA: Sage Publications.

Methods

Students joined one of three teams, each of which studied different links in the supply chain associated with the WMGC, including staff, partners, grower-members, and selected buyers. These relationships are illustrated in the schematic below:

A schematic representation of the Western Montana Growers Cooperative, its partnerships, membership, and buyers. Membership and wholesale sales percentages from 2011. Other sales (e.g., freight) were 6%. CSA sales are included in the institutional and other sales categories.

Student teams developed research strategies, and then collected and analyzed data in their particular topic area. Each of the teams reports in the following three parts:

PART I: Structure and Function. One team looked at the structure of the WMGC, its aggregation and distribution process, and the three primary (because other companies also distribute for them, not just Charlie's) strategic partnerships it has. In addition to document

review (e.g., sales data, organizational policies), the team carried out in-depth interviews with the all six of the staff members employed at that time, as well as some participant observation during warehouse packing and distribution. This team also interviewed five people from the three strategic partnerships – that is, at MMFEC; Common Ground Farm where the warehouse is located; and Charlie’s Produce, a partnering business that carries some of WMGC products to more distant cities in Montana.

PART II: Members’ Experiences and Perspectives. A second team focused on the grower-members of the WMGC. In addition to analyzing members’ sales and product data, the team conducted in-depth interviews with 15 of top 18 producers in terms of dollars sold through the Cooperative during the 2011 season (83% response rate). These semi-structured interviews focused on members’ interactions with and perspectives on the WMGC.

PART III: Customers Experiences and Perspectives. The third research team learned from selected customers about their experiences with this business enterprise. Because of the Cooperative’s interest in expanding the CSA, all 151 of its members were invited to participate in a self-administered survey; 112 members either filled it out at the pick-up site or returned it via mail for a response rate of 74%. Health food stores make up nearly half of total annual sales for the WMGC; therefore, this team conducted phone interviews with 10 buyers from nine stores. Lastly, because institutions constitute a perceived growth opportunity for the Cooperative, the team interviewed four of these buyers on the phone.

Interviews were recorded and transcribed; the research teams coded and analyzed the text to identify themes that answered the research questions using basic content analysis techniques.⁷ The CSA survey mostly had closed-form questions, which were tabulated and cross-tabs were analyzed for significance; the few open-ended questions were coded and tabulated.

The research approach used here presents several strengths and weaknesses. Given the number of people in this course project, we were able to collect and analyze a considerable amount of multi-dimensional data in a relatively short period of time. Such a holistic understanding of an organization within its social context is a hallmark of the case study approach. The in-depth interviews⁸ generated a detailed description of participants’ experiences and knowledge. Researchers asked all interviewees in a given group the same questions; however, participants also had a chance to raise unanticipated ideas, and probes were used to clarify, rather than assume, the meanings of terms. The strong response rates for both the survey and the interviews increase confidence in the data.

⁷ Hesse-Biber, S. N. & P. Leavy. (2011). *The Practice of Qualitative Research*. Second Edition. Los Angeles: Sage Publications.

⁸ Interview guides available upon request.

In addition to the goal of contributing to regional food system efforts, this project was most of all a learning experience for the student researchers. For most of them, this was their first time doing research. The project gave them an opportunity to develop new skills in a supportive environment and with guidance from the professor. In the process, students built new relationships and developed a first-hand and fairly detailed understanding of social and economic activity in the regional food and agricultural system. The research teams presented the findings to the WMGC Board of Directors and some of their key partners in December 2012.

“LOCAL IS DELICIOUS,” BUT IT’S NOT ALWAYS EASY:

A CASE STUDY OF THE WESTERN MONTANA GROWERS COOPERATIVE (WMGC)

SUMMARY OF FINDINGS

Structure & Function

- The WMGC is an agricultural marketing cooperative that is owned by its grower-members. Cooperatives are self-governed, democratically controlled businesses whose profits benefit the member-owners.
- The WMGC is building the regional food system by providing a cost-based service, ensuring farmers receive fair prices, and connecting farmers to larger wholesale and institutional markets. The Co-op bases its prices on gross margin (i.e., percent of selling price that is profit), including 25% for produce and 20% for meats and eggs. The pricing structure could be revised so that is more robust and reflects the variety of products and distance to markets.
- Over the course of seven years, the Co-op experienced an average annual rate of growth of nearly 31% (2006-2012). At times, cash flow for operations is dependent on members’ contributions as either short-term loans or accounts payable. The Co-op has relied on philanthropy, especially in the early years, and on grants, such as a recent one from USDA’s Farmers Market Promotion Program.
- In Fall 2012, the Co-op had three full and three part-time employees.
- Operations could be better streamlined and safer by developing schedules that allow for adequate driver rest, utilizing labor and time saving equipment, and minimizing travel with an empty truck.
- Additional equipment has made the warehouse work easier and faster. Yet, improvements could be made with respect to boxes, labels, accurate poundage increments, and pallet wrapping.
- Re-location of the warehouse and offices to Missoula is under consideration, which would make it more central for growers who farm to the south and improve access to the Interstate.
- The Co-op will benefit by developing more year-round markets, which would help to retain trained staff over the winter months and increase cash flow.

- Clear, consistent communication among all players will be essential to continued success.

Partnerships

- Partnerships with other businesses and non-profits have been and will continue to be key to the Co-op's success.
- The Mission Mountain Food Enterprise Center (MMFEC) has provided extensive assistance with cooperative development, processing facilities, food safety information and training, and connections to school and university markets.
- Common Ground Farm in Arlee (30 minutes north of Missoula) has housed the Co-op since inception and provided infrastructural support.
- For a fee, Charlie's Produce, a regional food distributor based in Seattle, has distributed WMGC's goods to markets in Central and Eastern Montana.

Producer Members

- Growing from nine members in its first year, the WMGC had 36 by 2011, seven of whom served on the Board of Directors at the time of the study. Members are located across a large rural area. Most of the members' farms are certified organic, branded with a local eco-label (Homegrown), or both.
- Although Co-op members heavily contributed to the vegetable category (62% of the members sold vegetables through the Co-op), these sales accounted for less than 30% of the total annual sales in 2011. In contrast, when combined, products such as fruit, dairy, eggs, and poultry account for 55% of the total annual sales, while only 38% of members contribute to these categories.
- Three members provided product that amounted to 37% of the total annual sales in 2011; another four sold over 26%; and 8 made up nearly 25%. Of the 36 members in 2011, 21 sold less than \$10,000 worth of goods.
- Products sold by multiple members while representing a small portion of sales (such as vegetables) may indicate potential areas of conflict for grower commitments. Low sales item may indicate areas for growth and increased member participation (such as beef and pork).

- According to the members interviewed, the primary benefits are: the distribution and aggregation of goods; empathetic relationships with other members; working with committed staff; financial return; and belief in local products.
- The WMGC has been particularly helpful to small and/or beginning farms improving their financial viability through improved market access, assistance with production planning, and opportunities to grow with the Co-op.
- Primary challenges mentioned are: inaccurate sales projections; competition between growers over commitments; competition between members and the Co-op for the same market; short turnaround from sales to pick-up; and the sales margin.
- Some members of the Co-op are much more deeply involved and invested in it than others who have limited sales and tend to remain on the fringes. Ten of the 15 farmers interviewed expressed that they were definitely committed to and invested in the success of the Co-op.
- Member engagement could be strengthened with greater communication (e.g., a newsletter), trainings, work parties, and increased attendance at the annual meeting.
- Members think the Co-op is fulfilling its role in the local food system by being an aggregation and distribution hub; increasing access to local foods; improving the viability of small and beginning farmers; and being “the face” of local food in the region.
- Most members would like to see the Co-op continue to grow. They raised several issues and provided specific ideas regarding: increasing the number of buyers, more thoroughly saturating current markets, diversifying the kinds of products sold by the Co-op, necessary steps for growth, and increasing the number of producer members. When discussing individual growth, members expressed willingness to increase or change their farm’s production to meet changing demands of the Co-op.

Customers and Markets

- Health food stores generated 47% of the total sales in 2011, followed by 26% at other grocery stores, 14% to restaurants, 7% to institutions, and 6% other.
- The sales from the CSA accounted for roughly 9% of the WMGC’s total sales (CSA sales are included in the institutional and other customer types above). The CSA has had positive financial impacts on the Co-op, while allowing more families to access local foods through the distribution of shares at multiple drop points and employees at an area hospital.

- Initiated in 2008, the CSA program has grown considerably to 151 shareholders in 2012. The Co-op aims to double that number in the next couple of years.
- Eight to ten farms provided for the CSA in 2011.
- CSA members consistently ranked the quality of the produce (freshness and taste) and the healthfulness of the food as being very important reasons why they participate. CSA survey respondents also greatly valued that they are “supporting local farming” (92%) and that they are “contributing to environmentally friendly agriculture” (86%).
- Buyers at institutions and health food stores valued being part of the movement to build a regional food system. They appreciated that the WMGC provides a reliable mechanism for purchasing in larger quantities and supporting a greater number of area farmers than the buyers could otherwise access. These customers also appreciated the high quality and freshness of the products, and they have generally found the ordering process convenient and easy.
- Buyers described their relationships with staff as strong and mutually beneficial. They praised the staff’s communication abilities and their willingness to address problems that arise. CSA customers also ranked the customer service of the CSA coordinator very highly.
- The buyers identified the need to improve packaging, provide more processed products, and increase quantities available.
- Knowing the particular farmers was not as important to CSA customers as the knowledge that they were supporting local agriculture. Conversely, health food stores noted that connecting a product to a certain farmer helped with sales. Indeed, they asked for more educational efforts around the meaning of certification labels and food source identity.
- Health food stores should continue to be a strong market because customers are more willing to pay premium prices for the high-quality, local/regional food. New opportunities in this market may be harder to find.
- Institutional markets – especially if processing expands – provide a growth opportunity for the Co-op. Their brand and information on the particular farms are less transparent to the end-user, however.

PART I: THE STRUCTURE AND FUNCTION OF THE WESTERN MONTANA GROWERS COOPERATIVE

Emily Davidson, Laura Ginsburg, Taylor Lyons, Stephanie Parker, and Caroline Stephens

The Place of the WMGC in the World of Cooperatives

Since its inception in 2003, the Western Montana Growers Cooperative (WMGC) has marketed and distributed agricultural products at a regional scale for its grower members. Every year, the WMGC has grown in number of members, sales, customers served, and pounds of products sold. The first section of this report focuses on the Growers Cooperative itself: the legal structure as a cooperative in the state of Montana; the history of the WMGC; past and current sales; an overview of aggregation and distribution practices; staff perspectives on a variety of topics; current partnerships; and future prospects.

This section is based upon data collected using three methods. First, our team carried out eleven in-depth, semi-structured interviews with all staff members and key partners. Interviews averaged 80 minutes in length. For nine of these interviews, two interviewers were present, and only one interviewer carried out the remaining two. All staff interviews contained standard questions about the individual's specific role; length of employment; questions regarding the mission, vision, and role of the WMGC; and thoughts regarding services the Co-op could offer in the future. Each employee also spoke to their own particular area of expertise within the WMGC. All interviews were recorded and transcribed and then coded for themes. Participants were assigned a unique code to identify their voices throughout this section and to increase the reliability of the reporting. In the findings below, employees of the Co-op are designated by the letter "E" and a number, and partners with the letter "P" and a number. The researchers have made every attempt to accurately reflect the opinions of the interviewees. Bear in mind that the thoughts expressed in the following sections reflect the perspectives of the staff and partners and not the grower-members. For the interview guide with staff members, see Appendix A.

The second method of data collection was participant observation through ride-alongs on pick-up and delivery routes and at the warehouse during order packing. Detailed field notes were taken during and after these experiences, which allowed researchers to observe first-hand the daily tasks of staff members.

The final method of data collection involved document review. Documents included such things as financials reports generated by the Cooperative, legal codes from the Montana Code Annotated, membership agreement forms, Articles of Incorporation, and By-Laws of the

WMGC. Document review gave us the ability to better understand the structure and functioning of the Co-op since its inception.

Cooperative Structure & Function

For well over 100 years, cooperative businesses have been representing and meeting the needs of their member-owners in the United States. From credit unions to buying clubs, cooperatives allow people to come together to address the needs of their community with a business model that is flexible and responsive⁹. For agricultural producers, cooperatives first became popular in the early 1900s in an attempt to protect themselves collectively from undercutting pricing strategies of larger businesses that could exert more buying power and downward pressure on price¹⁰.

Three major characteristics distinguish cooperatives from other business models. First, governance comes from a board of directors, comprised of member-owners. Theoretically, the board of directors has direct buy-in to the success of the Co-op and decisions are typically made by majority or unanimous vote. Other business models hold the Chief Executive Officer (CEO) or President responsible for company decision-making. Second, cooperatives are managed for the success and profitability of its members. Cooperatives have a mandate to pay out earnings to members or reinvest for improved functioning, such as upgraded facilities or infrastructure, or savings accounts for future purchases or loans. Other businesses are managed for profit of the business and to pay dividends to shareholders; typically earnings are not returned to workers. Third, cooperatives ideally operate under seven guiding principles that encourage knowledge sharing, democratic functioning, open membership, and concern for community, also known as the Madison principles (see Appendix B). Cooperatives are likely to: share lessons of business success and failures with other cooperatives; be invested in the well being of their members and surrounding community; and encourage a thoughtful, democratic process for decision-making. Most other businesses consider business information as confidential or proprietary, give to their community as a form of charity, and do not encourage worker input on decisions regarding company functioning.

Laws governing incorporation of a business and the activities the cooperative can undertake vary by state. Montana Code Annotated (MCA) Title 35, Chapter 17 describes state law

⁹ Nadeau, E.G. 2012. *The Cooperative Solution: How the United States can Tame Recessions, Reduce Inequality, and Protect the Environment*. The Cooperative Foundation. Available at: http://www.thecooperativefoundation.org/images/Cooperative_Solution_6x9-h_copy.pdf

¹⁰ Reich, A. 2007. The agricultural exemption in antitrust law: A comparative look at the political economy of market regulation. *Texas International Law Journal* 42(843): 843-874.

regarding agricultural marketing cooperatives. In Montana, an agricultural marketing cooperative must have at least five members to form and operate as a nonprofit cooperative association. Under MCA 35-17-105, the permissible activities include:

1. Any activity in connection with the marketing or selling of the agricultural products of its members or with the harvesting, preserving, drying, processing, canning, packing, storing, handling, shipping, or utilization thereof or the manufacturing or marketing of the byproducts thereof;
2. Any activity in connection with the manufacturing, selling, or supplying to its members of machinery, equipment, or supplies;
3. The financing of the above-enumerated activities;
4. Or any one or more of the activities specified herein.

The first step in forming a cooperative is to draft articles of incorporation, which includes primary information about who is coming together, for what purposes, where, and for how long. Articles of Incorporation describe the structure onto which the specifics of how the cooperative will function are built. Bylaws include information about meetings; what constitutes a quorum; election and terms for the Board of Directors; membership rules and fees; payment or transfer of stock; and reasons for withdrawal of membership rights (MCA 35-17-206). See Appendix C for the Bylaws of the Western Montana Growers Cooperative.

The Board of Directors (BOD) is the main decision-making body in a cooperative business. Made up of member-owners, the BOD is invested in the outcome of their decisions regarding the operation of their cooperative. In the WMGC, the five-member board is elected for 3-year terms, staggered to provide overlap and leadership for new board members. The Board governs:

the business and affairs of the Cooperative and shall be empowered to adopt all necessary rules and regulations not inconsistent with the Articles of Association or Bylaws. The rules and regulations may be established for the operation of the business, the guidance of the officers and other employees, and the management of the Cooperative. The Board of Directors of the officer or officers to whom the power is delegated, shall hire and fire employees of the Cooperative, and determine duties, salaries, and other conditions of employment (WMGC Bylaw 3).

The BOD also has the power to form an executive committee that has nearly all of the same powers as the full board, or other committees to address regulatory changes. The four officer positions include a Chairperson, a Vice-Chairperson, a Secretary, and a Treasurer. These positions are filled by election at the Annual Meeting. Board members are compensated for

meeting attendance and those who hold officer positions receive further compensation as determined by the BOD.

Member-owners constitute the base of any cooperative, and have their own rules and regulations that must be followed. A potential WMGC member first fills out an application regarding their interest in the Co-op and then the manager meets with them to determine their fit with the Cooperative. If the new member is approved, they pay a membership fee. Members must abide by the Bylaws and membership agreement (Appendices C & D). Annual membership fees are included as income of the cooperative. Membership benefits in the cooperative include pick-up, transport, and delivery of the farm's products, and some member's goods are further processed into value-added items at Mission Mountain Food Enterprise Center (see below for further detail about this relationship). An agricultural cooperative is required by law to sell the majority of goods from members, but up to 49% of sales can come from non-members.

History of the Western Montana Growers Cooperative

In the mid-1990s, a group of producers in Western Montana – that is, west of the Continental Divide – set the foundation of what would later become the WMGC. “There was a group of area producers that were just exploring the idea of marketing together. They called themselves the Mission Valley Organic Growers Cooperative,” said Jan Tusick, director of the Mission Mountain Food Enterprise Center (MMFEC). The organization was short-lived. Without technical assistance or existing infrastructure to work with, it struggled to establish itself. Nonetheless, the seed was planted to create a marketing and distribution cooperative that could help growers sell their products. Soon after, Jane Kile, an organic grower in Dixon, Jan Tusick, and other farmers were part of an initiative organized by the statewide Alternative Energy Resources Organization (AERO). AERO's Montana Food System Initiative involved a collaborative process for analyzing the food system in Western Montana and identified areas for development, particularly marketing and distribution of local foods. These concurrent developments, along with the dismantling of the Mission Valley Organic Growers Cooperative, set the climate for the founding of the WMGC.

In 2000, the MMFEC successfully secured a Community Food Project grant through the United States Department of Agriculture (USDA). The primary aim was to provide the seed capital for a growers cooperative. The founding members then had to convince other growers to join. “Jane went...up to Whitefish, she went up to Plains, Hot Springs, the local area and really held some good discussions with producers and identified their needs,” said Tusick. “A core group came together out of that work and organized the Western Montana Growers Co-op.” Incorporated in 2003, 2013 marks its tenth anniversary.

The above illustration captures early thought in the potential role for a growers' cooperative in Western Montana and was an outcome of the AERO Montana Food System Initiative.

The Co-op found its home base in Arlee at Common Ground Farm owned by Mary Stranahan. She had purchased the property a few years prior from the Bureau of Alcohol, Tobacco, Firearms, and Explosives, which had seized the land from its previous owners. The infrastructure left over—two warehouses and an office—became the aggregation and distribution facility for the Co-op. Another farmer who had previously leased land at Common Ground had built a refrigerated unit in one of the warehouses, which also was useful. Stranahan, a longtime supporter of the Co-op, charges very affordable rent for the Co-op's use of the warehouse. In order to develop infrastructure for distribution, Stranahan also helped the WMGC purchase a refrigerated truck. "I bought the truck and leased it to them and eventually, I donated it to them...when it looked like they were going to make it," said Stranahan.

From the start, the Co-op's primary vision was to increase food supply to the region by marketing, aggregating, and distributing local food products. The founding members hoped to

address the issues of increasing food access and local food supply by marketing and distributing local food products from local farmers. Yet the efforts at organizing faced challenges.

An important initial obstacle that had to be overcome was simply an apparent lack of interest among farmers. “The ones that were established were not interested in a co-op, because they were established and doing fine, and thank you very much, why add another layer,” said Stranahan. It took a lot of talking to farmers across Western Montana to increase membership. The founders of the Co-op had to “push people to join to some extent. [I had to] get some of my friends who were established farmers to join,” said Stranahan. But this barrier was “overcome within two or three years.” Indeed, by 2011 the number of members had grown to 36 in 2012 from the 9 founding farms in 2003. Details on the current membership are presented in Part Two of this report. The Co-op has also grown in terms of sales, reaching a high of over \$900,000 gross sales in 2012 (the time of this study).

Partnerships

As explained further below, the WMGC has developed several key partnerships. First, the Co-op has a partnership with Charlie’s Produce, a regional food distribution company based out of Seattle, Washington. Developed in 2011, and the partnership helps the Cooperative reach markets further from Arlee, taking WMGC goods all the way to Billings (about 370 miles to the east). Also in 2011, the WMGC began to process some of their produce with Mission Mountain Food Enterprise Center’s (MMFEC) processing facility in Ronan. In 2012, processing has continued to increase, allowing Montana farmers’ produce to be sold to more markets, such as local public schools, and throughout the year as frozen product.

Employees

In Fall 2012, the WMGC had three full and three part-time employees. Soon after data collection ended, the number dropped to five as the assistant manager stepped down, and two existing staff shifted roles in the wake of that transition. The number of staff typically decreases in the winter as the workload also diminishes but with the departure of the assistant manager and recently awarded grants, the WMGC retained the majority of staff during the slower season (winter 2012-13).

The general manager (GM), Dave Prather, completed his third season in this position in 2012. Previously, Prather worked as a driver, warehouse worker, and assistant manager. As GM, his job duties include: coordinating grower commitments; budgeting expenses; communicating with the Board of Directors; managing and hiring staff; growing the customer base and finding new markets; maintaining and procuring equipment; and helping in the warehouse as needed.

Perhaps most importantly, Prather coordinates the movement of produce from members' farms to its final destination, including scheduling processing at the MMFEC.

For nearly two and a half years, Jim Sugarek was the assistant manager and bookkeeper. His job mainly consisted of making sales calls, planning and budgeting, readjusting product prices, and working in the warehouse. Sugarek continues to do the books and create financial statements on a contractual basis. He stepped down as assistant manager in October 2012.

Steffen Brown has been the primary driver and distribution coordinator from mid-2011 through 2012. He does a lot of driving, for both pick-up and delivery routes. He also spends a good deal of time in the warehouse packing orders and coordinating with the other drivers as well as helping manage and train employees. Recently, he has been doing more direct sales with customers. Brown assumed the role of assistant manager in late 2012. The position is structured differently than in the past as it will not include financials and will be more centered on streamlining sales and distribution.

Connie Surber and Brianna Ewert both began their work with at the WMGC while the 2012 season was in full swing. As drivers and warehouse workers, they primarily pack orders and do delivery and pick-up driving. With recent staffing changes, Surber will now become the primary driver and distribution coordinator, assuming Brown's previous role. Warehouse workers often turn over each season.

Amy Pavlock has managed the Community Supported Agriculture (CSA) program for three seasons. She coordinates growers and production needs according to the CSA delivery schedule. Pavlock also markets the CSA during the off-season to gain new shareholders. During the growing season, she packs CSA boxes, ensures that people are paying for their shares, and writes a weekly newsletter included in each box.

Products and Price-Setting

The WMGC carries a fresh product line, striving to have produce to their customers within 24 hours of picking it up from the growers. The bulk of sales consist of vegetables, fruits, poultry, and dairy. Less than ten percent of sales are from other products or services such as meat, herbs, dry goods, and freight. As discussed in Part Three, the WMGC sells nearly half of its products to health food stores, another quarter to other grocers, and the remainder to restaurants, institutions, and other venues. Five years ago, the Co-op developed a Community Supported Agriculture (CSA) program. Having started with just a few farms and around 30

shareholders, the CSA program served 150 shareholders in 2012, with more than 40 at one drop-site.

The WMGC carries Certified Organic, a local label called Homegrown, as well as conventional products. The USDA defines “Organic” as food or other agricultural products that have been “produced through approved methods that integrate cultural, biological, and mechanical practices that foster cycling of resources, promote ecological balance, and conserve biodiversity”. Organic farms must follow production standards and be certified by an accredited USDA certifying agent.

Formed in 2005, the Montana Sustainable Growers Union (MSGU) is a group of local farmers within a 75-mile radius of Missoula. MSGU administers the Homegrown label, and its farmers pledge:

- No use of synthetic herbicides, insecticides, fungicides, or fertilizer on crops, fields, or livestock;
- Sustainable management practices of the soil, water, and air quality;
- No use of chemically treated or genetically engineered seed; and
- No hormones or antibiotic-laced feeds or feeds of genetically engineered origin.

Homegrown producers complete a questionnaire concerning their farming methods, attend two meetings per year, pay annual dues of \$50, participate in annual farmer-to-farmer visits, and are asked to donate \$25 worth of their product in exchange for the communication coordinator’s volunteer efforts.

In 2011, nine percent of the WMGC’s sales came from the CSA program. The WMGC decides which farmers grow for the CSA based on hierarchy for what growers have produced in the past. As one staff member explained, “We did the policy and procedure thing, and we decided that if [the growers] have been growing for the wholesale for at least one season of successful production then they could be considered for CSA. It needed to be something unique for CSA that we didn’t have or something that someone else didn’t want to grow anymore or they decided that they can’t grow it in the quantity needed.” The CSA portion of the Co-op’s sales is projected to grow and expand, especially given a recent grant from the USDA.

Price-setting

Certified Organic and Homegrown items are priced the same. According to S2, “conventional can be a little cheaper to quite a lot cheaper. And we really have trouble with conventional vegetable pricing because it’s really cheap.” Certified Organic and Homegrown products are priced at a premium using several methods:

- A consensus of the desired price expressed by growers;
- Historical data;
- Market research to set competitive prices, using Agriculture Marketing Service (AMS) reports and prices lists; and
- Reactionary pricing based on lowering the price if a product is not selling or, if possible, raising the price.

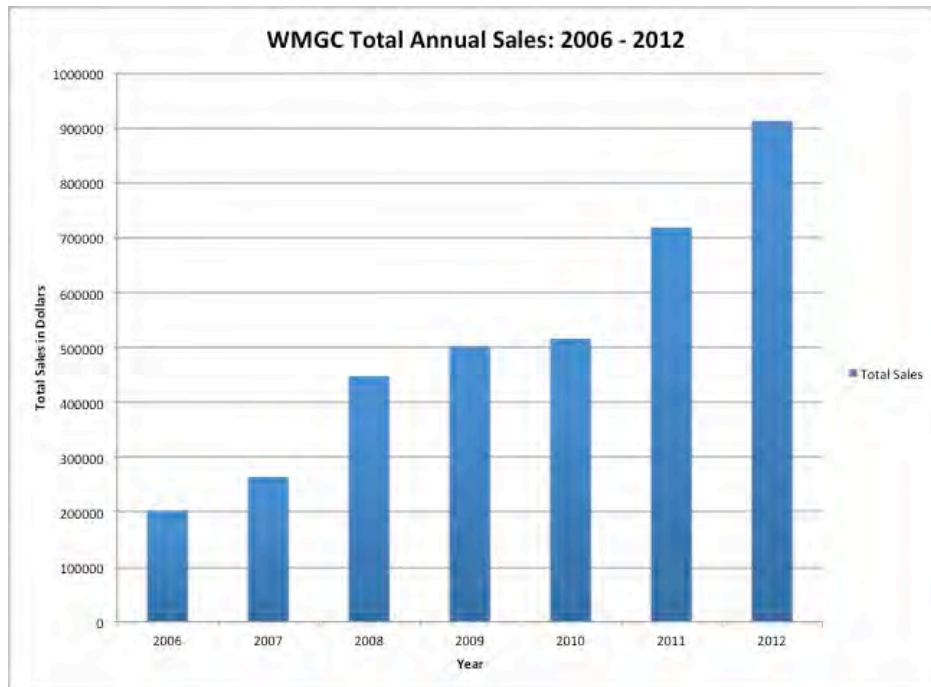

In return for distributing members' products, the WMGC keeps a gross margin of the price of each product, which is slightly different than a mark-up. The gross margin for produce is higher than other items at 25%, according to one staff member (S3): "Most of the produce is higher risk. If it is a bad batch, it is still our responsibility; but we can't always track it, or forget to. We can always track it but then we don't find out for another week or two if they [the customer] rejected it and then we have to work backwards, and maybe we have already paid [the grower]. So you end up with a lot of loss that way on the produce end that we can't really do anything about, so we need the higher margins to make that work." S3 also explained that, "A lot of high value items we can work on tighter margins." For instance, eggs work on a margin of 20% or less, the margin for meats is about 20%, and S3 believes the goal for everything this year (2012) is 22.5%.

A more robust, complex pricing system has been suggested, so the margins are set more equitably for everyone. This would involve greater flexibility based on the costs incurred by the WMGC and the benefits for the grower based on the different levels of marketing and the distance products are distributed for each grower. An issue brought up by S3 is that of sending products to places such as "Bozeman, Billings, and Helena, where it costs more to get there than Missoula, so in theory we could work on different margins for where things are going. But then you have to figure out the fairness issue for which growers get to send their stuff where."

Sales

The following charts illustrate sales trends beginning in 2006. Chart 1 describes total annual sales from 2006 – 2012. Due to incomplete sales data for 2012, Chart 2 shows sales from 2006 – 2011 by category. Since 2006, gross sales of the WMGC have increased at an average annual rate of 30.8%

Chart 1. Total Annual Sales 2006 – 2012.

Although some categories, such as dairy, eggs, poultry, and meat, have seen fluctuations throughout the years, sales in each category of produce have steadily increased (see Chart 2). For certain products, supply is not meeting demand, particularly for carrots and potatoes, which were the most frequently mentioned items of which the Co-op’s supply fell short. At times, the supply of the Co-op’s products may not meet demand in terms of customers’ access to certain products that can be found at the farmers markets before they are available through the WMGC. According to staff, untapped or unmet markets consist of hospitals, schools, institutions, and conventional grocery stores.

There is potential for the WMGC to expand to fulfill this unmet demand. For instance, certain WMGC growers wish to increase their operations and other growers in the region network with WMGC to fill in items that are in short supply. Expanding the CSA is another option being pursued, as is selling frozen products over greater distances by partnering with other distributors. Getting a better pre-season forecast for what the Co-op can do for customers by directly communicating with them may also help close this gap between supply and demand.

Chart 2. Total Annual Sales by Year and Category 2006 – 2011.

Financial Stability

The major sources of the WMGC's revenue consist of sales to health food stores, restaurants, conventional grocery stores, institutions, and CSA shares. Currently, the WMGC's cash flow for operations is dependent on members' contributions as either short-term loans or accounts payable. In winter especially, the WMGC relies on credit cards and grants. According to S3, "It would be nice to be able to improve [the infrastructure] and not feel like we are working on a shoestring all of the time. Pretty much the only way I know how to do that is just sell more." The cash flow needs of the WMGC are to improve infrastructure and to finance operations in the slower winter season.

The Co-op has also relied on other sources of income, including grants and philanthropy. For the first several years, grants were especially key. Grants continue to provide important support for expansion projects, such as an award from the USDA's Farmers Market Promotion Program in 2012 to increase the CSA. In addition, the relationship the WMGC has with Mary Stranahan, owner of Common Ground Farm, includes financial and other types of support for the Co-op. Stranahan provided the Co-op with a free truck and inexpensive rent on its storage warehouse and offices (see partnerships discussion below).

To improve the financial stability of the WMGC, a possible goal mentioned (S2) was to have investments from growers instead of loans given out of necessity and to access to an outside line of credit. Indeed, as Margaret Lund of the University of Wisconsin Center for Cooperatives points out, "All businesses require capital to buy equipment, purchase inventory, secure work space, pay staff and cover other necessary expenses. 'Member economic participation' is one of the key co-op principles. This means that in a co-op, not only do members share in the economic rewards of the co-op; they also share responsibility for making sure the co-op has the capital it needs to operate effectively." In turn, outside lenders typically expect cooperative member owners to have a substantial level of equity investment, opening the door to other sources of capital.¹¹

Several suggestions for lowering expenses also arose in interviews. One staff member believed handling a higher volume with the same amount of labor is possible. Having full loads and fewer loads were also suggested. According to S2, "there [are about 10 growers] that probably cost us more to deal with than we are getting out of it," creating greater expenditures to the

WMGC. According to this person, it is logistically easier for the WMGC to distribute and sell large quantities of fewer items than it is to sell small quantities of a wide variety of products.

Aggregation and Distribution

Transportation of agricultural products, especially vine-ripened produce, to consumers can be a challenging endeavor. As is the case with the WMGC, it can be even more challenging when you pride yourself on providing produce that was harvested just 24 hours prior to delivery. To maintain this competitive edge, the WMGC has overcome challenging transportation logistics, limited facilities and equipment, and developed a food distribution network that spans an area from the Bitterroot to Whitefish to Billings. This section outlines the WMGC's infrastructure and addresses the aggregation and transportation of products to customers. We conclude with thoughts on the possible relocation of the WMGC warehouse and offices.

Product Transportation

Transportation of goods is a time and resource-intensive task. In today's commercial and globalized food economy, food often travels many hundreds, even thousands of miles, from source to consumer. The WMGC deflates those miles to, at most, hundreds. In doing so, the WMGC provides its clientele with fresh products and aims to boost the local economy by serving its producer members. For this study, one leg of product transportation relates to how products arrive at WMGC from its members, while the other leg includes how packaged products leave the warehouse and arrive at their final destination. Based on an analysis of the data collected during in-depth interviews, several WMGC employees echoed similar themes.

The most prominent theme expressed was appreciation for the recent addition of certain pieces of Co-op equipment. Co-op employees understand the time and energy savings that something as simple as a truck lift gate can provide, or even just having two pallet jacks. One employee (S1) noted that they "did not believe in the lift gate, but now [realize] it's necessary." Also crucial for expansion was the addition of a second truck, as evidenced by the fact that both trucks run every day.

The drivers demonstrated a strong ability to communicate directly with growers and customers and be a "face" for the Co-op. Building rapport and addressing problems with produce managers can instill a level of confidence that otherwise may be absent from larger, corporately-owned food distribution companies. During one ride-along, an example of this was observed first hand, as a driver calmly addressed a disgruntled produce manager over a selection of apples. Due to the Co-op's style of management – where authority is shared as opposed to a more hierarchal chain of command – the driver was able to make a decision on

the spot and appease the produce manager. Also noted during the ride-along was the avoidance of empty miles (that is, driving the truck with no goods in tow). During product deliveries, the WMGC truck utilized empty truck space to pick up products from Co-op members on the back haul. This utilizes time and resources more efficiently. Another positive attribute that contributes to successful transportation of goods is that Co-op employees are time conscious. One employee, after a 14 hour day, commented to another employee that they “were sorry for taking so long” (S5) on their delivery. The other employee replied “don’t be sorry, it takes what it takes. You won’t have a guy that’s making eighteen dollars-an-hour come back apologizing for being gone fourteen hours” (S1). Overall, Co-op employees demonstrate a unique ability to turn produce around in 24 hours. Given limited access to facilities and equipment, their method of product pick-up and distribution is “necessary and sufficient” (S1).

Despite the dedication of the Co-op employees to execute successful product transport with limited resources, product transport could be improved. Most notable is the issue of irregular scheduling of employees. Several employees cited times when they were packing boxes for the following day’s deliveries at the Co-op until one or two in the morning, and then had to return at six or seven the next day to deliver the boxes of produce to Co-op customers. This negatively affects efficiency in that some of the drivers even reported having to take naps during their deliveries, as they were exhausted from the previous night. Although not on the clock, this still takes time out of the day and can lead to rushed work later on. Furthermore, given the inherent danger of driving, this irregular scheduling poses more risks on Co-op employees than may be necessary. One employee suggested that having more employees in the warehouse could help remedy the situation. With an additional employee to pack boxes, a driver could return from picking up a load of products and let the warehouse staff unload and pack the following day’s orders. This would allow the driver to return home at a reasonable hour and receive the rest needed for the next day.

Also hindering efficiency is longer-than-necessary pickup times at product drop points. Drivers have left explicit directions for growers at certain drop points on how to arrange products so that the driver can quickly load the products. When these directions are not adhered to, it causes delays and incurs costs. This does not happen frequently, but it does sometimes occur. Of all the routes the Co-op operates, the least profitable has been the one to Helena (about 2.5 hours from the warehouse one way). Unlike other routes minimizing empty truck miles, the Helena route has an empty truck on the way back. Helena’s orders tend to be small, which further exacerbates the poor returns. One suggestion was to advertise to haul goods back to Missoula, particularly goods that would not jeopardize sanitation requirements of a food truck.

Product Aggregation and Warehouse Operations

Once products are picked up and brought back to WMGC's warehouse, packing commences. Products are unloaded from the trucks, sorted according to purchase order, repacked, and sometimes loaded back onto trucks to await delivery the next morning. Depending on a variety of factors, this process can be very efficient or inefficient. The addition of certain key pieces of infrastructure has made work easier. As noted by an employee (S4), the addition of a computer with Wi-Fi access located in the warehouse has been helpful: "Having a computer and having Wi-Fi access in the warehouse has been huge. That way, when we have a question about something that's on the packing slip, we can really quickly check the bigger computer system and see what's going on. So that's actually a great benefit." Other key pieces of equipment are the forty-foot tractor-trailer-cooler, the additional pallet jack, and a lift gate on the additional truck. Another employee (S1) pointed out that with \$14,000 dollars worth of produce that needs to be refrigerated, the "tiny walk-in cooler makes that kind of impossible," thus hinting to the significance of this key piece of infrastructure. Another benefit of two separate coolers is the ability to store apples away from other produce as apples release a certain chemical that affects other produce. Co-op employees are also appreciative of growers who "bundle" big orders and label their destination, such as the Good Food Store.

Once again, while investigating product aggregation and warehouse operations, certain core themes arose among Co-op employees. The most common theme is that of a faulty policy governing the boxing of products before they leave the farm. Box issues were discussed in all aspects of the product transport chain, but were especially highlighted with regards to warehouse aggregation. If a box fails, this can hurt the Co-op in two ways. One is that there is lost time in cleaning up, and two, the product could be jeopardized due to bruising or insanitation. One employee (S5) noted that they did not even know that there even was a "bad box policy," and if they had known, they would have voiced their concerns sooner. WMGC's reuse of boxes four or five times may be economical and environmentally friendly, but it hardly adheres to current distribution standards and may in fact be illegal. Another interviewee (S1) noted "what's the point of a bad-box policy if no one is going to enforce it?"

Labeling presents another hindrance when it comes to efficiency of warehouse operations. Employees noted that sometimes growers do not use correct descriptions for the contents of each box. When the warehouse employee tries to match the description on the grower's label to what is in the WMGC database and it's not listed, it takes time to figure out exactly what is in the box and where it should go. Another mistake that growers sometimes make is forgetting to take an old label off one side of the box and adding a new label on the other side. This results in a double-labeled box, adding to the time it takes to figure out which is correct.

From a distribution standpoint, improper labeling may have legal implications. One of WMGC's partners, Charlie's Produce, cited WMGC's labeling as falling short of current distribution standards in that the boxes should all be uniformly labeled with the name of the distribution company (WMGC) and that the producer's name should also be on the labels, which is not always the case. A WMGC employee also noted that the adoption of a more advanced labeling system would lead to increased efficiency.

Another misalignment between WMGC and growers is the discrepancy between produce increments offered by growers and amount that customers order. For example, a customer might order 60 pounds of produce but the farmer only offers 20 pound boxes. Sometimes this requires repacking into bigger boxes and mix-ups have occurred. Another suggestion from a WMGC employee that would reduce waste and potentially save money would be to look into reusable pallet wraps for loading and unloading pallets from trucks. The current method involves wrapping pallets just to get them off the truck, and then un-wrapping them once they are off, creating "mountains of plastic" (S4). In conclusion, one Co-op employee may have stated it best: "it [warehouse operations] just involves more work. But as the way it is set up, that is the way it has to be. We just need to work; [the Co-op is] still in its adolescence, but until [it] grows up...we're still awkward in our movements and our growth" (S1).

Considering the Relocation of WMGC

As the WMGC continues to grow, the idea of searching for a new home has become a topic of discussion. The overwhelming consensus is that the new location should be in Missoula. Although the possibility of moving is speculative, interviewees did express why they thought a Missoula location would be beneficial. Its central location, relative to growers and Co-op customers, is a key factor. A move to Missoula would have a positive impact on transportation logistics. One driver expressed dismay over having to haul Missoula-bound products past Missoula up to Arlee (a half hour north) knowing that they would turn around and be shipped right back to Missoula. Therefore, products sourced from south of Missoula in the Bitterroot Valley would be positively affected, and northern-sourced products would just continue heading south. To complement this, there would be the added benefit of much easier access for eastbound trucks on Interstate 90, the only east-west interstate in Montana.

When asked what features Co-op employees thought would be most beneficial to the WMGC in a new location, several components emerged. In no particular order, the first would be access to loading docks, which would substantially reduce loading and unloading times. Second would be access to a temperature-controlled packing area. At the current facilities, Co-op employees struggle not to break the “cold chain,” that is, reduce the amount of time produce is exposed to varying temperatures. The new facility should also have larger and separate coolers located under one roof, which would also help with not breaking the “cold chain.” Lastly, having an office located in the same building as the warehouse would ease communication between management and warehouse workers, and allow for better oversight. Also, an office can provide a “face” to the Co-op with which potential customers and grower members could interact. Currently, the only “face” of the Co-op that many customers see are those of the drivers. An integrated facility with loading docks, proper cooling, and professional office facilities could really help WMGC soar to new heights. Finally, potentially sharing a facility with its distribution partner, Charlie’s Produce, would support both businesses’ values and make their partnership all the more efficient. There is the potential to streamline packaging, loading, labeling and to share equipment.

Working for the WMGC

Staff members consistently report that they enjoy working for the WMGC. One of the most common remarks made by staff was how satisfying it is to deliver high quality, locally grown items to stores and restaurants across the region. One shared that, “It is really rewarding knowing that we’re helping farmers and also getting good food out to people,” (S4). Another noted that they think the most rewarding part of their job is “taking this amazing produce and

products that people make and seeing it go from their place to... a grocery store or restaurant...and being able to present that, and say this came from your neighbor” (S5). Staff members express pride in representing the work of the farmers and the WMGC, such as trying to provide excellent service. One staff member (S6) said, “I like the customer service part. I really like talking to our customers. Sometimes we get negative feedback, but for the most part it is really positive. And if it is negative, then we try to figure out how we can make them happy and stay. That is probably the best part.” Also, many of the staff members said that they are actively involved in helping create and expand the local food system through their work with the WMGC. One (S3) reflected, “Food is an important thing for me. It is important for me to see the system grow and be a part of that.” Staff members also report that they enjoy working with each other; the current staff seems to have a lot of camaraderie, which our research team noted during observation visits to the warehouse and during interviews.

When asked during interviews what improvements could be made to Co-op operations and business, staff members mentioned three key topics. The first issue relates to the seasonality of the work and annual hiring of new staff members. Five out of six staff members related that they think the seasonal nature of the work is a drawback. Financially, it can be burdensome to be fully employed during some parts of the year and underemployed, or even unemployed, during the slower winter months. One staff member said, “it just hasn’t done well for me because it’s full time in the summer but then the hours get cut in the winter...So it’s really hard to put so much energy into something and then have to turn around and do something else to make ends meet” (S2). While not directly stated by interviewees, it seems as if the need to hire new employees every year causes some challenges, as new employees have to be trained and the growers and customers do not have a steady Co-op representative with whom they can develop strong relationships. A staff member noted that this is the first year in the past three or four years that the WMGC has had a steady driver and that has led to “some really solid relationships” (S1). Another employee noted how a new hire did not work out this season; therefore the Co-op had to hire new people during the busiest part of the year, making it difficult to provide adequate training. Three staff members noted that it would be beneficial to be paid more for the work they do or for the WMGC to offer them paid time off or other benefits.

The second challenge noted by staff is the tight turnaround in the packing, delivery, and pickup schedule. The staff is often in the warehouse until midnight or later packing orders, and then the driver has to come back early the next morning to make deliveries. One employee noted this challenge specifically, explaining, “we might be there until midnight but we are getting up the next day at 6 or 7 and then start driving. There’s not a lot of rest” (S5). Although there has been an attempt to get the drivers home earlier; late nights still occur occasionally. Being tired

while driving is a serious issue that arises as a result of this scheduling, and is something staff members hope the WMGC can address.

Staff members related that the third area in need of improvement is the relationship between grower-members and the Co-op itself. Staff members, while they are proud to represent the hard work of farmers across the region, express that they feel the brunt of issues regarding the relationships between the Co-op and members. Negative grower attitudes were frequently reported as being one of the areas most in need of improvement, as they affect the staff and the ability of the Co-op to function. One staff member stated, “It feels a lot of times like egos just get in the way. That can be a little difficult” (S6). Another staff member mentioned, “sometimes people are on totally different pages and there is a lot of people talking behind each other’s backs” (S1). Regarding how some growers sell outside the Co-op, a staff member (S3) noted, “It is definitely annoying and it hurts us even worse when they are selling it for less.” Staff also mentioned that it would be helpful for growers to have to work in the warehouse for at least one shift so that they can experience how bad boxes, mislabeled items, or poor packing jobs decrease the efficiency. Staff thoughts on how growers relate to the Cooperative are expanded upon in a later section, which goes into more depth about perceived member commitment to the WMGC.

In conclusion, the staff members of the WMGC all seem to enjoy the work they are doing. Every staff member expressed pride, feeling they do a good job for the members and that they are directly involved in strengthening the regional food system. Though employees identified a few challenges, the overall sentiment among employees is one of positivity and pride in working for such an important regional organization.

Staff Views on the Co-op’s Role in the Local Food System

A central question to this study was to understand how staff, member-growers, and key partners view the role of the WMGC in the local and regional food system. All interviewees were asked to step back from their own personal experience with the WMGC and explain their perspective on this topic. Interviewees offered diverse answers, but several themes emerged.

The WMGC has solidified its role as an aggregator of local products able to reach a greater number of markets. Without the Co-op, many local farms would be trying to sell smaller amounts separately, restricting their market access. By aggregating the goods of different growers, the Co-op is able to expand into more retail and institutional markets. One interviewee explained this relationship stating, “I think it has had a huge impact in getting more local food to more mouths. I think it’s had an impact on growing farmers...They have managed to network with regional distributing systems like Charlie’s Produce” (P1).

While aggregation is essential to reaching more markets, distribution is critical to getting goods from the farm to the consumer. The WMGC distributes the produce of their growers on their own trucks and through a strategic partnership with Charlie's Produce. Distributing on their own and with Charlie's Produce allows growers to reach markets that may otherwise be inaccessible, such as those in distant cities like Bozeman and Helena. According to one staff member,

Not everybody is going to buy everything direct from a farmer at a farmer's market or through their CSA. There's going to be some distribution that needs to happen...If we can send one big truck around that's really full, instead of a bunch of farmers driving all their individual trucks around... I think there's more efficiency there (S4).

Furthermore, the WMGC has bumper stickers, hats, and a logo on the truck so that people are able to associate their name and logo with local, high quality food. In lieu of nearly 36 farms all doing their own marketing, WMGC markets the aggregated goods as one brand. One Co-op employee expressed enthusiasm at seeing Co-op branding out in the community: "I had a moment the other day where I'm driving the truck and I'm behind a lady who has a 'Local is Delicious' bumper sticker on her car. And I'm just like, 'Yeah, that's pretty awesome.' It has our logo on it and it's pretty cool to see that" (S5). Another staff member (S1) added, "[It is important to] establish and maintain markets for our farmers because that helps...the money stays here, you are helping people that are here survive and in some cases, thrive."

One of the most important roles the Co-op plays is as a food hub for the entire region. Food hubs are simply understood as businesses or organizations that actively manage the aggregation, processing, marketing, and/or distribution of local and regional food products.¹² Through scale efficiency and improved distribution mechanisms, food hubs aim to meet growing demand for such products from households, retailers, restaurants, institutions, and wholesalers. Indeed, the WMGC is a focal point in Western Montana, or as one Co-op partner called it, a "Kingpin" (P1). The Co-op's Arlee warehouse, while not a convenient location for all, has become a food hub in western Montana's local food movement. By doing the aggregating, distributing, and marketing, they are an important point of contact between those who want to buy local food and those who want to grow and sell it. "I mean they're a food hub. That's what they are. Their business is social enterprise. It's there for its members and for the betterment of the food system," said P3. Additionally, WMGC is occasionally a food hub for growers outside the Co-op. When buyers have demands that cannot be met by the Co-op in a growing year,

¹² Matson, J., M. Sullins, and Cook, C. 2013. *The Role of Food Hubs in Local Food Marketing*. USDA Rural Development Service Report 73.

they are able to work with other growers so that they can continue their commercial relationships. One partner (P4) explained, “There aren’t that many carrots available from within the Growers Cooperative. So that’s an example of how they’ll look to kind of fill their supply needs from outside of the organization.”

The WMGC is regionally unique and could serve as a model for other growers cooperatives in Montana. Some interviewees suggested that the Co-op might eventually evolve into simply the “Montana Growers Cooperative,” with branches serving both the eastern and western sides of the state. However it is organized, growers in other regions could use the WMGC as a model for other operations that focus on food distribution, aggregation, and marketing.

The WMGC also acts as a kind of advocate for local food and agriculture. On a daily basis, employees communicate to retail buyers the importance of local food during their sales pitches and check-in calls. The importance of being an effective communicator was particularly highlighted by the drivers, who take their jobs seriously and take pride in being the reliable and loyal “face” of the Co-op. “People complain to me, and I resolve it,” said one employee (S1), “and sometimes that involves me talking with the stores, and then talking with Dave and Jim, or kind of going directly to farmers when there [are] issues.” The local food message is also passed on to customers during the CSA as well as just by seeing on a restaurant menu that the food being served is locally grown and purchased through the WMGC. On this topic, one staff member explained, “There’s kind of an educational repercussion to it all, and that happens in different ways. It happens in restaurants when people open up the menu in Redbird and read a paragraph talking about [why they are] committed to WMGC” (S1). Another staff member (S3) noted, “We are just helping, just facilitating that relationship between the farmer and the customer.”

In its role in the Western Montana food system, the WMGC wears many hats. The ability of the Co-op to be an effective component of the supply chain requires that it be able to successfully fill its mission and various roles, most especially as a business that works for its grower-members.

Mission of the WMGC

When asked about the mission of the WMGC, staff members were unsure whether or not there is a formally adopted mission statement. The organizational documents we reviewed do not contain an explicit mission statement, which suggests that the WMGC does not currently have one. However, the website does contain a short statement of purpose: “The Western Montana Growers Cooperative is a coalition of growers in the Flathead, Jocko, Mission, and Bitterroot Valleys whose goal is to provide the market in our region with fresh, quality products from our

farms. To reach that goal, the Cooperative provides a wholesale marketing and delivery service for its members. We strive to improve the local food system of our area by enhancing the sustainability of local farms and contributing to local economic growth, while reducing the demand of produce being shipped here from long distances.”

According to staff members, the mission of the Cooperative begins with “connecting small growers with the local community” (S6) or, as another put it, “simply to build a stronger food system in Western Montana” (S4). This includes “helping growers access the wholesale market” (S3) by “providing a cost-based service” (S3) and “helping them sustain and grow their individual businesses” (S1). A large part of this is enabling individual farmers to “sell more stuff” (S2) than they would be able to on their own, or “to increase access by getting local food into places where farmers couldn’t individually” (S4). This also includes providing a “comprehensive, fresh product line” (S3) to customers, getting a “fair price for farmers” (S5), and putting a “good face on the Co-op” (S1).

Staff members explained how they think the WMGC is living up to its goals. One staff member noted, “there are a lot of institutions that are purchasing from the Co-op because of the convenience...and the larger selection” (S4). Another employee said that “we are selling a lot of food from the growers, so...we have been able to grow and get new growers on [as members]” (S3). Increasing access to locally grown food for individuals is also an important part of the mission of the WMGC. One staff person shared a story of how a potential customer followed her as she was making deliveries because she “had heard about the CSA and wanted more information about it” (S4). Concerning the handling of goods, another employee stated, “Everybody’s really careful...we take really good care of the products that come in” (S5). One staff member offered a summary of how the WMGC is effectively impacting the local food system: “The other really great...part of all this is that we’re benefiting more than just ourselves. We are having an impact on the local food system. And actually in the past year, it is happening...being able to work with those people that are doing the snacks in the schools programs and stuff like that. We are kind of enhancing the food system” (S1).

Employees of the WMGC also had some thoughts on how the mission of the Co-op could be improved or enhanced. One staff member felt that, “if we could expand [sales] more through the Mission Valley, I would feel even more confident that we are sort of living up to the mission statement” (S6). Several employees commented that improving operational efficiency and the sustainability of staff schedules and workload would also really improve the organization (S4). On this topic, one staff member offered, “standard infrastructure improvements, whatever we can do to streamline operations and pick-up, orders, labeling” would really improve overall organizational effectiveness (S3). Another staff member felt that there needs to be a greater

“understanding (of) the different roles...producers understanding the aggregation piece...and warehouse people understanding delivery issues” (S5) to improve the efficiency of moving goods from the farm through delivery.

Thus, based upon information from the website and employee reflections, the mission of the Western Montana Growers Cooperative is to:

- Build a stronger regional food system by connecting growers with individuals, the community, and larger wholesale markets through aggregated sales;
- Provide a cost-based service;
- Mindfully handle products to ensure quality and freshness;
- Ensure farmers receive a fair price for their products, allowing them to sustain and grow their businesses.

Thoughts on Cooperative Structure

When asked if they thought the WMGC was best operated as a cooperative business, four staff members were unanimous in their agreement that a cooperative structure is the best fit. Reasons given for the importance of remaining a cooperative include: ensuring the farmers “have some control and are being fairly treated” (S4); that being a cooperative “legitimizes” (S1) the work that they do; that customers might feel like they are “more directly supporting their local food scene” (S5); and that it helps in “relationships with other businesses” (S3). Of the two who did not completely agree, one said, “that is what it is, for better or for worse” (S3), while the other noted that what is most important is, “the relationships and how the business is run and how people are treated” (S2).

Despite the overwhelmingly positive response to the question of whether or not the WMGC is best served under a cooperative model, it was also noted that other business models such as LLC’s or corporations do provide some other benefits. Most of these benefits were related to differences in decision-making and leadership. One staff member said, “It would give us a little more flexibility in doing certain things and not have to be so democratic about everything. We could just operate as a business and make decisions that were based around the business itself” (S3). Another noted that the major issue they saw with the cooperative model is that “there is no clear leader or decision-maker” (S6), which means that it is more difficult to make decisions “towards the whole organization making money and profit sharing within that” (S6).

In order to remain successful as a cooperatively run business, staff members feel like farmers need a better understanding of what being part of a co-op means. One staff member noted, “I think [a greater understanding] is going to be critical to the continued success by actually having everybody buy into the...idea that it is a co-op” (S3). This sentiment leads directly into

the following section, which discusses how the level of producer buy-in to the WMGC may affect future success.

Thoughts on the Relationship Between Members and the Cooperative

Several staff members expressed that growers are “really into working together” (S2) and that “they really want the Co-op to succeed” (S5). Staff gave examples of members that take the time to serve on the Board of Directors, how some members “whole-heartedly” (S5) agree with what the WMGC is trying to do in the food system, and that some members are “actively involved” (S4) in the success of the Co-op and the farmer-members. These sentiments directly relate to the understood mission of the WMGC, in that the Co-op is helping individual farmers become more successful by offering larger markets. Additionally, another employee noted that, “I’ve heard from farmers their gratitude at what a great job the Co-op does at representing their products when they [the staff of the WMGC] are selling them” (S4). The pride the employees take in representing the Co-op and individual farmers is noticeable to the members and appreciated because it puts a good face on the WMGC, the farmers who are a part of it, and the products that are sold.

When the WMGC was founded a decade ago, many of the current member-growers were already successful farmers in Western Montana. These growers had operated for years on their own, marketing their goods to area stores, restaurants, and direct to consumers at farmers markets. Most of these farms are widely recognized in the region and have made a name for themselves through their hard work and dedication. When the WMGC was formed, many of the businesses targeted as Co-op markets were already purchasing from individual farmers. Most of these farmers later became members of the Co-op while retaining many or most of their individual sales accounts. Thus, many of the members sell some items through the Co-op and other items individually to the same establishments, essentially competing with the Co-op for sales. Oftentimes, these farmers are selling the exact same product through the Co-op and via direct sales to the same buyer.

A non-compete policy that all members agreed to has existed since the early years of the Co-op, but it was not clear, fully understood or enforced. At the time of this study, the WMGC was going through a deliberative process to help address the issue of competition between members’ direct sales and the Co-op’s sales.¹³ As mentioned briefly in earlier sections, selling outside of the WMGC can be detrimental to the Cooperative financially and for staff morale. This section explores staff thoughts on member-Co-op competition.

¹³ Soon after completion of this research, the Co-op formally adopted a new non-compete policy at their February 2013 Annual Meeting. See Appendix D.

Perhaps because the issue of competition between the WMGC and some of the members was being discussed at the time of this study, the area most in need of improvement from the staff's perspective is that growers need to understand that selling outside of the Co-op hurts the Co-op's success, thus hurting all of the member-growers. One employee said that the issue with grower competition is a "big deal" (S3) and is something that needs to be worked out. Four staff members mentioned that they feel as though some growers view the WMGC as a "Co-op of convenience," where farmers can sell their extra produce or they can sell more items, but they view the WMGC as essentially another customer.

The attitude that the WMGC is just another customer for a farmer is an interesting one, and was often mentioned by staff members. Staff members feel like growers do not understand that when they sell outside of the Co-op they are essentially competing against themselves. One employee explained that, "they also have to recognize that they are a part of something and that's a problem. Some [members] don't understand this...They understand their business, and they think of the Co-op outside of their own business" (S1). Half of the employees expressed the view that members need to more fully integrate the success of the Co-op with their own farm's success, instead of seeing the two as independent from each other. However, no employees explicitly said that individual farmers should give up their existing accounts, underscoring the importance of having these established, larger growers as part of the WMGC. The economic choices that farmers must make, particularly those who joined the Co-op with existing accounts, is highlighted by one staff member: "I don't think anybody is saying, 'oh, I want to go out and hurt this person in order to better myself,' but I think people are understandably really concerned about their own economic situation because farming is such a hard business...I think people should do things for their self-interest – it's part of doing business. You run a business to be successful" (S2). Although not directly stated, the overarching feeling of the staff seems to be that members need to have a better understanding of their role as owners of the WMGC, and what that ownership entails. The success of each member of the Co-op is based on the success of the Co-op as a whole, and this is directly linked to the ways in which individual farmers navigate the sales of their own products in relation to the sales of their products through the WMGC.

Because of the obvious pride and effort staff members put into their work, some staff members talked about the competition issue as being hurtful to themselves as employees of the Co-op. One staff member stated, "I feel like some of that success of the growers, of the individual members, has been at the expense of the staff and the infrastructure of the Co-op itself" (S2). Another staff member related that members, "need to know that the people that are there are working hard to get you [growers] the best price for your product and your hard work" (S5). Another employee, clearly passionate about his/her job and upset about the competition issue,

explained that, “we obviously have something more invested in this and...part of it is pride, at least from where I come from and from what I see in [other employees],” and later said, “everyone takes it [their job and the work they do] personally” (S1).

The issue of competition and the level of grower commitment to the WMGC is a sensitive and charged topic from the perspective of the employees. The staff members are overwhelmingly positive about the work they do and how the Co-op helps the success of individual growers while creating a stronger, more vibrant food system.

Partnerships

Over the course of its first decade, the WMGC has developed three partnerships that have been important for its growth and success. This section describes the Co-op’s partnerships with Lake County Community Development Corporation (LCCDC), Common Ground Farm, and Charlie’s Distribution to better understand the role of partnership in the western Montana food system. The role of partnership is integral in creating values-based supply chains, or here called, value chains. According to Larry Lev and W. Stevenson (2011), these value chains have the potential to connect midsize farms and ranches to processing, distribution, and retail businesses. Partners along value chains can work collectively to build an alternative agri-food system¹⁴.

Lake County Community Development Corporation

History of Partnership. One of the Co-op’s most deep-rooted partnerships is with Lake County Community Development Corporation in Ronan, Montana. LCCDC is made up of several centers, many of which contribute to its mission of community economic development. The first relevant to the Co-op’s history is the Mission Mountain Cooperative Development Center (MMCDC). Prior to the Co-op’s founding, in the late 1990s, a loose-knit group of growers in Western Montana was interested in marketing their produce together in order to reach larger markets. This group called themselves the Mission Valley Organic Growers Cooperative. While this early incarnation of the Co-op was not successful, it planted the seed that would later sprout into the WMGC. The MMCDC backed a study that evaluated what would be needed to build the local food system in Western Montana. The study identified a missing link in distribution along the supply chain. The MMFEC helped write the USDA Community Food Project grant that provided funds to start the WMGC in 2003. “The real focus of that grant was to organize a cooperative, to start bringing producers together to market whatever that cooperative decided to pursue,” said one founding member (P2). The MMCDC has continued to

aid in development projects, including the Farmers Market Promotion Program grant the two organizations were awarded by the USDA in 2012.

The Mission Mountain Food Enterprise Center (MMFEC) is another arm of LCCDC and houses a food processing facility, which is available to community members who want to develop value-added processing. The processing facility had begun with a focus on manufacturing specialty food products that were not necessarily locally sourced. After the processing facility went through numerous financial dives, the MMFEC began to shift its focus. “With various funding streams like specialty block grants, the Montana Department of Agriculture’s Growth Through Agriculture program, and the High Stakes Foundation, [MMFEC] really had some seed capital to invest in some equipment for processing vegetables and also to experiment, develop markets for those vegetables,” said one partner of the Co-op (P3). With this additional funding, the MMFEC began its processing partnership with the Co-op, taking in raw product from the Co-op and altering it in some way to make it more marketable to certain buyers. According to one employee, MMFEC was shifting back towards its original mission for the processing facility by asking, “How do we work with local producers to help them...process their...seconds into usable products?” (P2).

A market study in Western Montana had identified a processing gap between growers and institutions. “It had...been identified as one of the biggest challenges of getting products to schools, because they don’t want raw products, they want processed,” said one partner of the Co-op (P2). K-12 schools find it much easier to purchase processed food, such as chopped lettuce, cut carrots, and pre-skinned and cut potatoes because “producers typically are not going to come in and do that processing” (P2). In 2011, the MMFEC hired a Montana FoodCorps¹⁵ volunteer whose goal it was to further develop the Farm-to-Institution program to get more local food into nearby K-12 public schools. The Farm-to-Institution program was then better able to network with both the WMGC and institutional buyers.

Processing Arrangement. During the first year of this partnership, the MMFEC purchased raw product from the Co-op, and then re-sold it to institutional buyers. This model of ownership partitioned more risk for MMFEC than for either the Co-op or the buyer. Recently, however, the program has developed new models of ownership that spreads risk more evenly along the supply chain. In addition, the program began to cultivate a larger network of institutional buyers, including Kalispell Public Schools. It also began to develop more processed products. This past year (2012) has been the busiest for the MMFEC processing facility. As one WMGC

¹⁵ Montana FoodCorps is a program run by the National Center for Appropriate Technology and involves a partnership with Americorp’s VISTA. FoodCorps facilitates a statewide team of volunteers whose mission it is to build Montana farm-to-cafeteria programs, especially in schools.

employee observed, “They’ve processed a lot more for us...It’s probably been ten times more than it was last year” (S2).

The current arrangement between the Co-op and MMFEC regarding processing has taken time to develop, and was recently formalized with a Memorandum of Understanding. The partners identified two models of ownership, depending on the type of processed good. The first is for fresh processing. In this scenario, the institution purchases the raw product from the Co-op. The cost of processing is included in this cost, and the Co-op then pays the MMFEC for the processing service. This model is driven by demand; processing is dependent on what institutions are interested in purchasing. The MMFEC facilitates this transaction; they work with the institutional buyer to determine what food product they would like to purchase and in what processed form they would like that product. Fresh processed products include melons, cucumbers, beets, carrots, cabbage, bell peppers, and apples.

For frozen goods, the Co-op and MMFEC created a shared risk model. Because the frozen processing happens in such large volumes, they needed to be able to spread risk more evenly among organizations. So, in this case, the Co-op provides the raw product, MMFEC provides the labor and facility for processing, “and not until a significant percentage of that inventory has been sold will anyone get paid” (P4). The Co-op is the marketer for these types of products. The core products for this model have been Flathead cherries and butternut squash. This model is more supply-driven, because the Co-op members’ excess “seconds” determines what will be processed. “Last year we mastered...the fresh slicing, dicing, packaging, and now we’re working on freezing skills,” explained one MMFEC employee (P4). MMFEC is focusing in terms of product development on frozen products. “We’ve been kind of dabbling in it this year, we blanched and froze green beans, shredded carrots and zucchini and froze that. Last week we did frozen roasted pumpkin. Now we’re diving into butternut squash,” explained one employee (P4). This multi-faceted partnership that includes both business development and supply-chain development through processing is beneficial for both the WMGC and the LCCDC.

Benefits for the Western Montana Growers Cooperative. The Cooperative benefits in numerous ways. The first is financial, both through processing and cooperative development. Many employees noted the gross financial benefit of processing. “For the fresh pack for just the schools, it will be \$20,000 worth of product,” said one employee (S3). The financial benefit goes to both the WMGC as an organization, as well as the farmer members. “I think almost everyone grew squash. They’re all benefitting,” said another employee (S1). In addition to providing income for the Co-op, the frozen processing program also allows for the Co-op to extend their season and cash flow. They continue to sell product through the winter, increasing income flow during a slower time of year. “We have the help of MMFEC and we can get a few more value

added things in there to stabilize us throughout the year as far as cash flow is concerned,” said a WMGC employee (S1).

With processed goods, the Co-op is also able to enter new markets. Although the WMGC has had an important relationship with the University of Montana’s Farm to College program since inception, the partnership with MMFEC has been particularly effective at expanding sales to K-12 schools in the region. One employee of the Co-op explained that another benefit was not having to process the raw product themselves. With MMFEC processing for them, WMGC is able to expand their markets to institutions that would otherwise be less likely to purchase their unprocessed products.

Another benefit is market share. As the only business selling processed, frozen local products, WMGC essentially has the entire market in western Montana. “If their competitor wants the product, they can buy it from the Co-op. So there’s some market control...that they’re getting in these winter products,” explained an employee at MMFEC (P3).

Yet another benefit to the Co-op has to do with technical assistance, which both parties mentioned. Part of that assistance pertains to food safety. “We have really helped the Co-op start looking forward on how they can really be proactive in meeting upcoming food safety regulations,” said a LCCDC employee (P2). The general manager of the WMGC had to get a wholesale food license, which the MMFEC helped him acquire. These advancements in food safety and labeling help the Co-op ensure safety as a reputable business, which makes their products even more attractive to institutional buyers.

Finally, LCCDC has been able to connect the Co-op to a larger, nationwide network of food hubs and cooperative businesses that work in food systems. For instance, they sent the general manager of the WMGC to a food hub conference in Chicago, Illinois. Because of that conference, “the growers Co-op started looking at their CSA program, looking at hospitals, and possibly their human resources [at hospitals], and cost-sharing CSAs. That happened because of conversations at the food hub conference,” explained a LCCDC employee (P3). The MMFEC is able to link the Co-op to other similar businesses, building its capacity for growth and development.

Benefits for Lake County Community Development Center. The Co-op helps fulfill the mission and goals of the MMFEC, which is to process and market local foods to institutional buyers. “The benefit...is really the services that the Co-op provides. I came here with the mission to help local schools get local food. When I try to imagine doing that without the Co-op, oh my god!” said a LCCDC employee (P4). The Co-op provides the services of aggregation and

distribution of local food products that increase capacity for the Farm-to-Institution program. Without this system in place, one MMFEC employee noted that the Farm-to-Institution program would not be able to buy bulk orders of Timeless Seeds Lentils, which are used to make lentil burgers for local public schools.

MMFEC employees also noted that what was previously a financially unstable processing facility is now making a profit. “It’s bringing in a revenue that’s extremely healthy to this organization,” said one LCCDC employee, “We are actually functioning as a processing facility” (P2). In addition to bringing in revenue from the regular processing of both fresh and frozen products, the increase in capacity has led to the creation of three jobs and the retention of one, bringing the total number of current employees to four at the processing facility.

Areas for Improvement. Despite these recent successes in this partnership, the research team identified several areas for improvement. One of the biggest challenges is the steep learning curve in processing. One employee at the Co-op noted that, “They are still learning on their [the MMFEC’s] end... If they were totally set up and ready to go...that would just be one less thing to worry about” (S3). Employees at MMFEC echoed this sentiment. There have been challenges with both the raw product and processing equipment. MMFEC is trying to figure out which varieties of produce are best for processing, some of which may not be the more common fresh market varieties typically raised by growers. For example, one LCCDC employee said, “We had a year where the apples were different, and so we ran into some processing issues, we didn’t process apples last year” (P2). They are also refining processing techniques. For instance, in 2012, MMFEC tried a new method for processing pumpkin, because the method used the previous year had been too time-consuming. As MMFEC continues to process for the Co-op, they will continue to refine processing techniques.

Limited capacity on the part of both organizations constitutes another need of improvement. An increase in farmers growing greater quantities could increase the supply of food being processed. More employees at the Co-op and more employees on the floor of the processing facility could also benefit the partnership. “Last year we ran out of some of our core processing crops like carrots and beets. By February we were pretty much done processing,” noted one LCCDC employee (P4). Because of limited capacity in terms of both supply and infrastructure, processing moves at a much slower pace. “We have to go very slow because you always have to be concerned with your supply side,” said another LCCDC employee (P2).

Yet another challenge is the fluctuating nature of the supply and demand. “We were supposed to do 10,000 pounds of frozen cherries, but we didn’t end up with as much as we had hoped, which is totally stupid in a bumper crop year,” said one WMGC employee (S3). With a new

market avenue for processed goods just emerging, it will take time for the market supply to become more stable. Similarly, a few years ago, farmers brought in apples that were above cider quality. Blemished apples, known as seconds, are typically used for cider, to lower the cost of the value-added product. These farmers wanted to sell their firsts for cider; “They had no market for their number ones. They were dumping...their apples on the market, getting rid of them at a cider price” (P2). This market flooding was apparently due to Chinese apples flooding American markets, according to an employee at MMFEC. Market fluctuation is still unpredictable for regional businesses operating in global markets.

The partnership also faces challenges related to education. More education of growers about Good Agricultural Practices (GAP) would enable their processed goods to enter additional institutional markets, such as Montana State University, which requires GAP certification for local products. There could also be more education for buyer entities: “You get into a whole other component of advocacy of education on nutrition, education on freshness, education on economic return, which is what has to happen to really engage that market,” said a LCCDC employee (P2). Education of buyers as to the advantages of buying processed local foods through MMFEC and the Co-op would help ensure that those producer-consumer relationships will stand regardless of changes in food service directors, which sometimes dictates whether that institution will buy local products or not.

MMFEC noted the frequent communication that takes place, making this partnership work. One MMFEC employee said that the frequency of communication “probably wasn’t the most efficient way to do business” (P4). Developing strategies for efficient communication would help streamline business practices between the two organizations.

Best Practices. Despite challenges, the partnership has proven successful in a variety of ways. While there is a steep learning curve, “we’ve taken what we’ve learned and we have been able to identify a couple key products like the squash and the cherries that we’ll do year to year,” said one LCCDC employee (P4). And MMFEC continues to seek out new processing equipment to improve efficiency and lower cost; “We’re looking at a large truck oven that could very well bring some efficiencies to our baking” (P2). Continuing to develop efficient processing systems and products will allow this partnership to grow.

MMFEC has also established itself as a safe processing facility. “If I’m on the phone with the food service director, I can say with absolute confidence that the process was done under strict HACCP¹⁶ plans,” said an LCCDC employee (P4). Institutional buyers trust the quality and safety

¹⁶ Hazard Analysis and Critical Control Points (HACCP) is a program of the US Food and Drug Administration that addresses food safety through regulations along the supply chain, from production to distribution.

of products processed at MMFEC. Those institutional markets would probably not be as available if they were not able to adhere to such safety standards and instill trust.

Despite the frequent and inefficient communication, the two organizations have been able to work closely to develop a strong business relationship. “We’re very honest about the hard numbers,” said one LCCDC employee (P4). There seems to be a sense of camaraderie between staff members at LCCDC and the Co-op. This was noted during participant observations in the warehouse when an LCCDC employee was picking up produce from the WMGC warehouse.

Future of Partnership. Both the WMGC and LCCDC plan to continue to collaborate, particularly in terms of expanding their processing capacity. MMFEC hopes to continue to develop its product line. “Right now I do feel like sometimes we’re very reactionary in our processing, so by really developing some more specific product lines I think we’ll create some stability to all this,” said one partner (P4). There are also opportunities for developing new products, based on what crops grow well in Montana. “We’ve done some coleslaw. They did that a little bit this year because the cabbage crop you can grow really well here,” noted a WMGC employee (S2).

MMFEC plans to continue to expand the market that the partnership reaches. “There are new markets out there that we should be discussing. Hospitals have come up,” said one employee (P2). One possibility is through “a grant-funded project to look at pooling together our area schools’ purchasing power. By bringing them together and forming real agreements, what could that mean in terms of efficiency and economies of scale?” (P4). Through market growth and development, MMFEC hopes to create a more sustainable business and fulfill its mission of community development. Expanding the market for processed local foods also contributes to the development of the values-based supply chain in western Montana.

In addition, MMFEC is developing a GAP certification program for Co-op members. This would address issues of limited markets to institutional buyers who require GAP certification. MMFEC is in a good position to develop this program, because of its past experience adhering to safety regulations in its processing facility. This kind of program could continue to expand the market for processed local foods.

Common Ground Farm

History of Partnership. As with the LCCDC, the Co-op’s relationship with Common Ground Farm goes back to its inception. When the WMGC was first forming, they began the hunt for an appropriate location. One of their members, Mary Stranahan, had land with two large warehouses and an office. This infrastructure was left over from the land’s previous use as a cigarette production facility. A tenant farmer on Stranahan’s land had also built a refrigerated

unit in one of the warehouses. While the Co-op was forming, she was trying to find a use for this infrastructure. “The key to how to distribute was to have a storage place, a central storage unit. So my farm was used as a centralized storage place,” said Stranahan. At that point it made sense to put the Co-op on the farm in Arlee, a central location for farmers to the north but less so for those coming from the south.

The Co-op is still located on Common Ground Farm in Arlee. They use the warehouse with the refrigerated unit and the office, and pay a small amount for rent each month. “I think we charge them rent, but it isn’t very much...I think it’s pretty cheap,” said Stranahan.

Benefits of Partnership. The benefits to the Co-op come in the form of storage space and affordable rent. A philanthropist, Stranahan has also helped the Co-op purchase their two refrigerated trucks. The benefit to Common Ground Farm is that the land can be used successfully. “I just like that I’m a part of a successful enterprise. That’s my biggest pleasure,” said Stranahan.

Future of Partnership. According to Stranahan, “I think ultimately they’ll move out of there, cause they’re gonna need more than I can provide...That’s a natural evolution.” During our interviews, Co-op management agreed that they are outgrowing the warehouse space at Common Ground Farm. “We never really planned on staying here for very long,” said one employee (S5). However, the WMGC is still considering some way that they could continue to use the space at Common Ground Farm. “Maybe we could keep the trailer up there for fruit which would be a good thing because all of our fruit comes from the north, most of it,” said one WMGC employee (S1). If the Co-op continues to grow, they will have to address the issue of whether the Common Ground Farm location is best.

Charlie’s Produce

History of Partnership. The most recent partnership, Charlie’s Produce and the WMGC began working together in 2011. Charlie’s Produce is a regional food distributor in the Pacific Northwest, with its main offices in Seattle, and its nearest regional office in Spokane. Charlie’s Produce has worked with small cooperative businesses throughout its 30-year history. For example, several years ago, Charlie’s was marketing and distributing for a growers cooperative based out of Seattle, Farmer’s Own. The cooperative failed in its first few years, and Charlie’s purchased the business, retaining its management and its brand identity. So, support of small cooperative businesses is not unprecedented for Charlie’s.

Jon Clarenbach started working at Charlie’s three years ago as the Missoula sales representative. His boss, Larry Gilbert, Sales Representative at Charlie’s, met Karl Sutton of

LCCDC at a local food conference in Moscow, Idaho. Jon followed up with Karl after the conference and the two discussed how both businesses could work together. They had a meeting at LCCDC in the winter of 2011 and subsequent meetings over the next six months to solidify the partnership between the Co-op and Charlie's.

Distribution Arrangement. Charlie's has distributed WMGC produce to Helena, Bozeman, Butte, Livingston, Kalispell, and Whitefish. They charge a shipping fee per box, or by the pallet, if orders are big enough. Charlie's also charges an additional fee to pick up produce in Arlee. Otherwise, the Co-op drops off produce at the Charlie's warehouse in Missoula. The Co-op owns the product and pays Charlie's for a freight service. Charlie's distributes for the Co-op twice weekly. This logistical relationship is beneficial for both the Co-op and Charlie's Produce.

Benefits for the Western Montana Growers Cooperative. Partnering with Charlie's benefits the WMGC in many ways. The most obvious benefit is the wider distribution access that a regional food distributor can provide. The Co-op doesn't have the infrastructure or freight quantity to move their produce those distances, so working with Charlie's helps them move into markets that would otherwise be inaccessible. According to one partner, "They've expanded their territory by using existing distributing companies, which is smart" (P1). Co-op employees expressed some of the same sentiment: "I drove the route to Helena a couple times this year, which was the first time we had actually driven to Helena, as opposed to having Charlie's...take it. It feels pretty silly to be driving this pretty empty truck from Arlee to Helena" (S4). Another benefit to the Co-op is that Charlie's charges by the box for freight, which lowers what the Co-op has to pay. "They give us a better deal than most people who charge by the pallet," said one employee (S3).

Both partners discussed another latent benefit, which is the mentoring relationship between Charlie's and the WMGC. In working with a multi-state distribution entity such as Charlie's, the Co-op is able to observe the standards and best practices of a 30-year old, established distribution company. Clarenbach said that they have been able to share things, such as how to build a pallet, but that there could be more communication about best practices. A WMGC employee echoed that thought, "They know a lot. It's nice to be able to pick their brains as far as trucking goes... We are still pretty amateur" (S3).

Benefits to Charlie's Produce. In distribution, there will always be a fixed cost for delivery. No matter how full or empty the truck may be, the cost for fuel, and for the driver will remain the same. Because of this fact, it is beneficial for Charlie's to carry WMGC produce. The fee that the Co-op pays for freight decreases the cost to Charlie's for distribution of its own produce. Another benefit for Charlie's Produce is being able to provide a desired product for their

customers. According to Clarenbach, customers want to buy local produce, not just organic produce. Charlie's doesn't sell a lot of local food products, so they can provide that to their customers by distributing WMGC produce.

Areas for Improvement. Despite this advantageous partnership, there are still areas for improvement for both Charlie's and the Co-op. One challenge is logistical. If a truck is sent to Arlee too early before the produce is packed and ready, then the driver wastes time. From Charlie's perspective, the Co-op's location in Arlee is a disadvantage because it is located away from their distribution center in Missoula and Interstate 90.

Another challenge is the amount of time spent coordinating sales and distribution. Clarenbach mentioned that both the Co-op and Charlie's make sales calls to the same buyer entities, which is very time-consuming. Both partners also spend time on the phone a few times a week coordinating with each other. Clarenbach mentioned that a more streamlined arrangement could be more beneficial for both partners; for example, if Charlie's buys produce from the Co-op and becomes a middleman to some buyers. Another suggestion was to create a closer relationship with Charlie's and the WMGC by sharing a warehouse space. Sharing space would allow for more efficient distribution, and would also facilitate more communication and sharing of best practices.

Additionally, there is a discrepancy in distribution practices between Charlie's and the Co-op. The WMGC's reused boxes are not legal in the produce industry and, according to Clarenbach, can be challenging for both Charlie's and the buyer to handle. The WMGC labels are also below distribution standards and can be challenging to work with. Better boxes and labels would streamline this partnership and create more transparency in distribution.

A final area for improvement is the volatility of this newer partnership. "My biggest fear is that they will just get tired of us one day and leave...They are a different company and they have their own needs and they have to look out for themselves first," said one WMGC employee (S3). In 2012, Charlie's stopped distributing to Helena for the summer, which meant that WMGC had to start sending their trucks there if they wanted to continue to sell to those buyers. More long-term commitments between Charlie's Produce and the WMGC would help solidify the partnership.

Future of Partnership. At the time of the interviews, both Charlie's and the Co-op see this partnership continuing and developing. About selling produce to Charlie's as a middleman, one Co-op employee said, "Ultimately we might be able to do a little more with that, especially sending stuff back over west into Idaho and Washington" (S3). Another employee said about

the Co-op's relationship with Charlie's, "We're gonna try and make it more streamlined" (S1). Both parties stated that they want to continue working in partnership; however, even during the course of this project, the partnership has experienced some strains.

Role of Partnership in the Western Montana Food System

Throughout the interviews with WMGC staff and partners, the research team found a common theme of shared values. In trying to establish a new model for food production and distribution, different organizations and individuals found that cooperation, rather than competition, has been the most fruitful course of action in establishing an alternative food system in Western Montana. These cooperative business partnerships are built upon the foundation of real relationships. What strengthens those relationships and partnerships are shared values. "It's developing this food system, so creating or expanding markets for growers and increasing access to local foods for our people. By sharing those goals...we have a very unique relationship," said one partner (P4).

Although turning a profit is important to economic sustainability, the motive behind all of this collaboration and effort is not solely economic, even the logistical partnership between Charlie's and the Co-op. One employee mentioned that the two organizations share similar philosophies about organic food and food access. It is upon these shared values that the local foods supply chain is being built in Western Montana. "If you look at the growth of the Growers Co-op, the growth of this organization (MMFEC), and of the (University of Montana) Farm-to-College program, they all started about the same time," said one partner (P3). The coalition of individuals has been working together for over ten years, and has built the different components of the food system, from processing to distribution.

Over fifteen years ago, several community members who have been involved in the partnerships discussed in this research created a food vision as part of a Food Systems Initiative, coordinated by AERO. The image they drew to represent a food systems vision for Western Montana is useful in this context of values-based partnerships along the supply chain. The elements of the food system are coming together. It has taken time to form these strong values-based partnerships along the supply chain, but it is these partnerships that have created this interconnected web. One partner noted that, "There was turf at the beginning, but there isn't a lot of turf anymore" (P1). Rather, "there is just a core respect and trust amongst all of us...and I think that's made this [work]. It just seems to be a natural evolution of moving together in new directions," another partner observed (P2).

These organizations have been able to support one another while meeting both individual and shared goals. Strategic partnering of different types of organizations has also been beneficial.

“For-profit and non-profit partnerships are really critical as we start developing new inroads into local foods markets,” said one partner (P2). For example, MMCDC has been helpful in assisting the Co-op to secure grants that help fund new initiatives, such as the CSA. In helping the Co-op secure funding, the MMCDC fulfills its mission of cooperative, community development. “It’s about these whole value chains, where everybody along the value chain has to benefit. It has to be partnerships with people instead of always butting heads,” said a WMGC employee (S2).

Particularly when working to create an alternative to the industrial food system, these partnerships are important; “Without that [partnership] you’re always gonna be at a combative position, what’s best for me, and that isn’t conducive to creative maneuvering. And that’s exactly what we’re doing, creative maneuvering in a business world,” said an LCCDC employee (P2). One Co-op partner has great hopes for what these values-based partnerships have the potential to do for the Western Montana food system. “I put a lot of hope in this coalition of people, way beyond the Co-op. How do we solve these barriers to local production?” (P1).

Role of the WMGC and Future Prospects

Thoughts on Growth

A majority of the staff agreed that some further growth of the WMGC would be positive for both the business and the local food system. Financial stability that might come along with more sales was a frequently cited reason for growth. With financial stability, the ability to move into or upgrade to more appropriate facilities would be possible, and as one staff member put it, “and not feel like we are working on a shoestring all of the time.” More growth would also allow the WMGC to take on additional growers and give them the ability to absorb the loss of producers or product because when a business is bigger “you can make those harder decisions.” Two staff members felt like the Co-op should only grow if members wanted it to, but that growth would provide the opportunity for increased sales and for staff to be more fairly compensated. One staff member did think the Co-op could grow, but that it should happen naturally. They must first solve issues of “fairness and...efficiency” in “serving the members we have right now” (S2).

The staff offered up avenues for the WMGC to consider as strategies for growth. Some staff suggested that the Co-op needs to market itself more and find ways to increase existing customer purchases. One employee wanted to “just to be a recognizable brand as it were, so when people buy something they can say, ‘oh this is from such and such farm from the Growers Co-op.’” Others suggested that growers need to understand their own costs when selling

outside of the Co-op and how allowing the Co-op to market for them could increase their overall productivity. One person proposed, “making the case that it is a smarter business idea to sell only through the co-op. It might not look like it at first because you are getting less price for your produce, but you don’t have all these other expenses anymore.” Some employees suggested expanding the sales into more institutions, either through the CSA program or with a greater variety of processed items. An employee illustrated this idea: “we can get a few more value-added things in (to institutions) to stabilize us throughout the year as far as cash flow is concerned.” Another staff member thought the multi-farm CSA model provides “stability and security,” while another employee noted that the CSA sales to institutions are a “big part” of expected growth. Others suggested that the WMGC just needed to sell more overall or get more growers to produce items that are in short supply.

What WMGC Could Offer Their Growers and Employees

Staff members were asked for thoughts on what the Co-op could potentially offer its members in the future. Staff had a variety of ideas on this topic.

Sense of Community. One issue that was brought up often during our interviews is that the ‘cooperative’ aspect of the Co-op seems to get lost sometimes. Most staff members do not think that the growers feel like they are owners of the Co-op. “A lot of growers view the Co-op as not their business, they view it as something different. They view it as we are a customer of theirs essentially,” said S3. Because of this, some staff offered suggestions for ways in which the Co-op could help build a sense of community while also helping to keep costs down for growers. Some of the farmers don’t know each other very well. Farm tours could be a useful experience for growers. This would allow farmers to meet one another, see how other farms operate, and feel more included in the Co-op community.

Work Requirement. One employee suggested mandatory warehouse work as a way for growers to understand how the Cooperative operates and to feel more like they are a part of it. The work requirement suggested could be just a one-time thing, and it could promote understanding between the growers and the staff and create a feeling of community and common purpose.

Boxes. Issues surrounding the quality of boxes used for packing produce demand their own section because of the frequency with which they were mentioned during the interviews. Growers often use the wrong boxes for produce, which can lead to damage if the boxes break. Additionally, the boxes often have to be unpacked and repacked which takes time away from those who work in the warehouse. Most of the interviewees suggested that the Co-op begin supplying boxes to growers so that greater quality control and marketing could be guaranteed.

On this topic, one staff member (S5) noted the benefit of providing, “A packaging system that’s more uniform across the board so people aren’t scrounging for crappy boxes. And they’re not buying crappy boxes.” This would hopefully save employee time as well as the cost of produce that otherwise might spill from lower quality packaging.

Training and Certification. Staff mentioned that more training is needed. “It would be great for the Co-op to offer producers a manual or even some training in some of the production and packing guidelines. You know, these are the standards. This is what we mean when we say ‘Number 2.’ This is what we mean by sizes. This is the proper way to pack something. This is the proper type of box to use. This is how it should be packed,” said one staff person (S4). Another noted, “We have got these new food safety regulations coming up and we are going to have to do a lot of that to get people up to snuff. And then, just with beginning growers and some existing growers, working on quality standards, packing, things like that” (S3).

An additional recurring suggestion among staff was to assist growers seeking organic certification. Organic produce commands higher prices, but the certification process is extensive and costly. For the Co-op, it would be easier if everyone were certified organic so that all produce could be sold at premium prices and marketed uniformly. It would be beneficial to both producer members and the larger Co-op if the Co-op were able to help growers transition and/or navigate organic rules.

Equipment Sharing. Since some member farms are relatively close together, a few staff suggested that the growers could collaborate and buy or lease larger farm equipment. Equipment sharing would serve the dual purpose of lowering equipment costs on each farm while also creating an opportunity for farmer networking.

Health Insurance. A benefit not currently being offered by the Co-op but mentioned by several staff and a few growers is health insurance for producer members. Interviewees noted that the Co-op, because of the size of its membership, could potentially offer health insurance at costs lower than those paid by farmers individually. One staff member (S1) said, “Health insurance is something that I know a lot of farmers do not have...I mean, we have all these people, 30+ farms, we should be able to do something collectively to make things like insurance cheaper for everyone.”

Vision for the Future

Staff members were asked to envision the future of the Co-op and to describe what it might look like in a few years. Employees offered numerous suggestions for what they would like to see happen. Regarding operations, five of the six staff members hoped to see improved

infrastructure that would lead to better efficiency, particularly in the warehouse. One staff member listed off the things s/he would like to see: “Maybe some additional trucks, additional infrastructure, another forklift, multiple coolers, just little knick-knacks you need” (S3). In conjunction with improved infrastructure, several staff mentioned moving to a new location with facilities better suited to the workload and needs of WMGC. One staff member explained that, “with a place that is easy to unload and load, you don’t need as much equipment. It can basically be just a pallet jack and people can just be loading and taking things off more easily” (S5). Another interviewee noted that the WMGC would improve existing partnerships and build new ones to increase efficiency in distribution and to reach a more distant market. On this note, one employee said, “I am also interested in some of these frozen things, being able to ship them further afield and working off other distributors. Things like frozen Flathead cherries could be marketed far and wide and that would be an easy one to do” (S3). Increasing sales was another thought, particularly to institutions and through the CSA.

A couple staff members thought the WMGC would be run more like a business that was fair to employees and growers. One (S2) said, “It should be a real job...that has a job description and a beginning and end to the pay scale.” Another envisioned that “a more business-minded model with the goal...at the end of each year [to give] the growers a percentage dividend of what the Co-op has made” (S6). Two staff members really emphasized that they would want the WMGC brand to be recognizable and in every store “from here (Missoula) to Whitefish” (S1) by really “inundating our customers...to where they don’t have an excuse to not market their stuff as locally grown from us” (S3).

Conclusions

Throughout Part One a common and over-arching theme has emerged: the necessity and critical importance of communication and partnerships in the development of a strong regional food system. From the formation of the Western Montana Growers Cooperative to more recent developments, such as the partnership with Charlie’s Produce and delivering CSA shares to a local hospital, working together towards a common goal has been critical. Clear communication is key as the Co-op seeks to address issues that arise among members and between members and Co-op leadership. If there is a single take-away message, it is that growing a localized food system that benefits everyone from the farmer to the consumer takes hard work, dedication, and may not always be easy, but the results can have tremendous and far-reaching impacts.

PART II: EXPERIENCES AND PERSPECTIVES OF WMGC GROWER-MEMBERS

Ellie Costello, Kim Degner, Quentin Means, Eva Rocke, Seth Swanson, and Dave Wise

Characteristics of Members and their Farms

The Western Montana Growers Cooperative (WMGC) is a member-owned marketing and distribution cooperative comprised of a relatively diverse group of producers. The WMGC has grown from humble beginnings of nine members during its first year as an incorporated cooperative business in 2003 to 36 members in 2011. Its members are situated primarily across Western Montana (that is, west of the Continental Divide) and produce a variety of products ranging from fruits and vegetables to meat and dairy. Most of the members' farms are either certified organic, branded with a local eco-label (Homegrown), or both. A geographically and materially diverse group results in both intrinsic difficulties and unique complements for the WMGC.

Location of members

The members of the Co-op range in location from the eastern shore of Flathead Lake to the rich soils of the Bitterroot Valley, and from the so-called "banana belt" of Sanders County to the open plains of Conrad, MT. The member locales encompass a large area of a large state, which encompasses over 147 thousand square miles. The members of the WMGC are spread over 6% of that area or nearly 9,000 square miles. Much of this area is limited to small valleys throughout this mountainous region.

The Co-op headquarters on the Common Ground Farm in Arlee is near the center of this large area. The members of the Co-op are located anywhere from 0 to 227 miles from the headquarters with an average distance to headquarters of over 37 miles. Clusters of producers are found in various agriculturally productive regions throughout Western Montana, but primarily situated along the MT Highway 93 corridor. Map 1 illustrates the location of all grower members, with Highway 93 being the vertical line most growers are organized around.

The diverse climate, topography, and soil types of Western Montana allow members to produce an array of agricultural products. Unique, regionally-specific products are grown, such as Flathead Lake cherries from Big Fork and lentils from the Golden Triangle in North Central Montana. Farmer ingenuity and season extension techniques also play a role in the ability of warm season crops, such as peppers and tomatoes, to thrive in a region otherwise limited by a short season.

Map 1. Location of Producer-Members in Relation to WMGC Headquarters in Arlee

Currently, the WMGC sells products based upon the members' agricultural system; see Chart 1. Members are classified as Certified Organic (COG), a local eco-label called Homegrown, or conventional (other). Those producers who are COG must adhere to regulatory guidelines provided by the United States Department of Agriculture (USDA) and the National Organic Program, including input restrictions, detailed record keeping, inspections, and associated fees. The COG label ensures the consumer that the product purchased was produced with minimal inputs and an environmentally responsible fashion.

Many producers have found that obtaining and maintaining COG status is not always practical. Accordingly, the Montana Sustainable Growers Union developed the Homegrown label as a result of their concerns about the National Organic Program. A small group of farmers in Western Montana formed MSGU in 2005. The group's members pledge to abide by certain

practices (many of which are consistent with organic certification) and to review among the peer-producers. Participating members of the MSGU are able to use the Homegrown label for their products as an alternative to the COG label; however, some WMGC members have both.

The last category of producers is simply not classified with the COG or Homegrown labels. The lack of label is not necessarily an indication of agricultural practices. These producers too may utilize low-input, sustainable agricultural practices, but do not carry a label. About half of the Co-op members are classified as either Homegrown or COG, and some members carry both a COG label and a Homegrown label.

Chart 1. Grower Classification: Total Membership and Sales, 2011

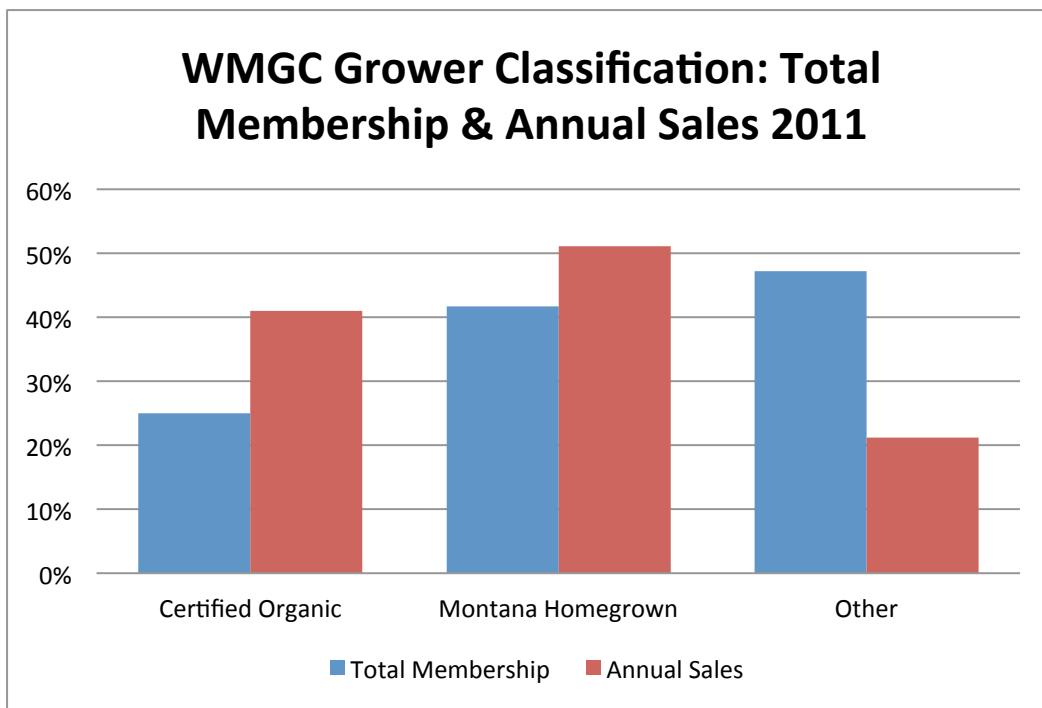

Chart 1 illustrates that the total annual sales by classification type was weighted more heavily on the COG and Homegrown labels than on conventional products. It should be noted that because producers can be both COG and Homegrown, there may be duplicate representation in Chart 1 for total membership in each label type. The difference in annual sales may be the result of specific products or volumes contributed by members, or could be the result of premiums given to COG products, or consumer demand.

Methods

The perspectives of individual members are vital dimension to a case study of the WMGC. According to the 2011 purchases by vendor, 36 members of the Co-op sold product through it in that year. The research team determined that the most effective means to understand the perceptions of the members was to conduct individual face-to-face interviews. A limited time frame meant that only a sample of the overall membership could be effectively interviewed.

Table 1. Producer Classification, Number of Members, and Sales, 2011

Producer Classification (total 2011 membership)		Number of members	Share of total member annual sales of WMGC
Annual Sales through the Co-op	>\$40,000	3	37.4%
	\$30,000-\$40,000	4	26.5%
	\$10,000-\$29,999	8	24.8%
	<\$10,000	21	11.3%
Production classification	Certified Organic	9	41.0%
	Homegrown	15	51.1%
	Conventional/other	17	21.1%
WMGC governing board	Current board member	7	35.6%
	General membership	29	64.4%
Membership Term	1-2 Years	10	21.8%
	3-6 Years	16	39.1%
	7-9 Years	9	24.0%

As previously discussed, the members of the Co-op are a diverse group according to their geographic location, product specialty, production practices, and annual sales through the Co-op. As Table 1 illustrates, members can be categorized based on their total annual sales through the Co-op, production classification (certification type), and current board affiliation. The research team decided to purposively sample by selecting the members in the top three sales categories. That is, we selected those who sold more than \$10,000 worth of product through the Co-op in 2011. The fifteen members comprising these three sales categories make

up over 88% of the total annual sales of the WMGC. The research team assumed that these members would have greater involvement and, therefore, greater familiarity with the Co-op because of the volume and value of the products they move each year. Ideally, all members would be interviewed, but time was a limiting factor.¹

Ultimately, fifteen interviews were completed for a total response rate of 83%. To recruit participants, each member invited through a personal letter explaining the project goals. A phone call followed to determine whether they were willing to participate and to coordinate an interview time. Of the fifteen originally contacted, two were unable to be reached after multiple attempts, and a third member declined the interview, stating personal reasons. The team then moved down the list of members (ranked according to sales) and contacted three more for a total of fifteen.

About the Study Participants

The fifteen members who were interviewed included a diverse group of producers. Their products ranged from vegetable produce to fruit and from eggs to meat. The members were also diversified in regards to their certification, board standing, and annual sales, seen in Table 2. The members interviewed provided a fairly balanced representation of production classification with five COG producers, six Homegrown producers (two classified as both COG and Homegrown), and six conventional/non-classified growers. Over half of the board members were among the interviewees. Though we were not able to interview all members, those we did speak with appear to be fairly representative of various characteristics in Table 2.

Each member participating in the interview was asked 14 questions (both open-ended and closed-form), with supporting queries and comments unique to each conversation (see Appendix E for interview guide). All interviews were recorded, with the consent of the participant, transcribed, and coded to identify themes.

Though the interviews were primarily focused on member interaction and perception of the Co-op, additional member characteristics were discovered. Every member interviewed indicated that they have alternative sales outlets for their products. For a majority of these members, less than 50% of their total annual sales go through the Co-op. According to the member responses, many utilize a variety of alternative sales outlets including farmers markets, direct to grocery stores, other direct sales (individual CSA's, individual sales, etc.), and restaurants.

¹ During spring 2013, David Wise carried out a follow up study and interviewed many of the members who sold less through the Co-op in terms of sales. The report is available from the Mission Mountain Food Enterprise Center.

Table 2. Classification and Sales of Grower-Members Participating in Study

Producer Classification (15 member sample)		Number of members	Share of total annual sales of WMGC
Annual Sales through the Co-op	>\$40,000	2	20.6%
	\$30,000-\$40,000	4	26.5%
	\$10,000-\$29,999	6	16.5%
	<\$10,000	3	4.6%
Production classification	Certified Organic	5	41%
	Homegrown	6	30.6%
	Conventional/other	6	16.6%
WMGC governing board	Current board member	4	18.9%
	General membership	11	49.7%

Member Sales Analysis

The research team conducted an analysis of past sales documents and categories to understand the broader picture of member contributions to the WMGC. Based upon 2011 member contributions, most Co-op members produced vegetables, whether conventional, COG, or Homegrown for the Co-op. The next major group of products were fruit and herbs. The relative homogeneity of the crops produced can be associated with some similarities in production areas. Hyper-specialty crops or products, those fulfilling specific market niches, seem to fall into unique environmental regions such as Flathead Lake, or unique member identities such as the only dairy producing member.

Although Co-op members heavily contributed to the vegetable category (62% of the members sold vegetables through the Co-op), these sales accounted for less than 30% of the total annual sales in 2011, as shown in Chart 2. In contrast, product categories such as fruit, dairy, and eggs and poultry account for 55% of the Co-op's total annual sales when combined, while only 38% of members contribute to these categories. Without direct feedback from members, this seems like an area of potential conflict and competition between members. These product categories

with relatively few contributing members compared to the weight in annual sales may be potential areas for niche production.

Low annual sales derived from the meat categories (beef, pork, and lamb) do not necessarily indicate that these products have low sales potential, but are just an indication of low annual sales through the Co-op compared to its other products. These items could be addressed as potential areas of growth. These assumptions do not take into account the market potential, per unit price value, or the volume sold of any of the products, but may highlight opportunities for member diversification.

Chart 2. Percent of Product Sales by Category and Members Contributing, 2011

Benefits of membership

As a member-owned cooperative, an awareness of personal member gains is critical if the Co-op is to continue serving its members effectively. What benefits are producers receiving through their Co-op membership? The ability to recognize and articulate benefits may solidify for members the shared interests of their cooperative values.

Interviewers asked questions to help identify benefits of Co-op membership (Appendix E). In addition to asking specifically about the financial benefits of Co-op membership, we also posed the open-ended question, “What benefits have you experienced as a member of the WMGC?” Interviewees noted a range of benefits of Co-op membership throughout their interviews when discussing the WMGC in our local food economy, the effectiveness of Cooperative governance, the communication among members and staff of the WMGC, services that members would like that the Co-op is currently not providing, overall commitment to the WMGC, and plans for the future of the Co-op. Our analysis strives to synthesize all of these reflections.

In general, benefits mentioned by producer-members fell into two broad categories, financial benefits of membership and those associated with being part of a local producer community, which are discussed below. Members less frequently mentioned benefits related to seasonal planning or to the convenience of working with the WMGC. In descending order, the following are the general benefits mentioned by five or more producers:

- Distribution of goods;
- Empathetic relationships with other farmers;
- Aggregation of goods;
- Committed staff;
- Overall financial gain; and
- Belief in local products and altruism.

Financial Benefits of Co-op Membership

Importance to Members’ Operation: Farmers emphasized to varying degrees the importance of the financial benefits of Co-op membership in relation to their farming businesses. Many WMGC members have seen the financial success of their farm businesses improve with Co-op membership. When asked to rank the Co-op’s importance to the financial success of their business, responses ranged from “critically important” to “not very important.” Eight farmers reported that the Co-op was either “critically” or “very” important to the financial success of their business, while 4 members classified the Co-op as “somewhat” important. Three members did not specify the level of the Co-op’s importance, though these members did specifically mention other benefits of WMGC membership. Although the degree of importance varies, 87%

of the participants did report some aspect of financial gains as a main factor in their continued WMGC involvement. The financial benefits members mentioned generally coincided with the functions of distribution, aggregation, and marketing that are provided by the Cooperative.

Financial Benefits

Related to Distribution, Transportation, & Freight Services. Farmers had a lot to say about Co-op benefits related to production transportation, distribution, and the basic freight service it sometimes provides. Fourteen out of fifteen members identified factors related to distribution as benefits of membership, with 8 of the 15 farmers interviewed mentioning specifically that “distribution” is a benefit. One farmer explained, “Distribution in Montana is...a really weak link to creating a sustainable food system in the state, and for us, WMGC is an important distributor” (PM15). Another member noted: “The vast majority of our business is through the Co-op...If the Co-op didn’t exist, we wouldn’t be able to deliver to all the markets that the Co-op delivers to” (PM5).

In addition to supporting producers through improved distribution, two growers noted that the Co-op has taken over the transportation of their farm products to some businesses with which these farmers were already conducting business. These growers described efficiencies created by having the WMGC transport their products given low volume or limited infrastructure. For instance, one said: “Well, all the driving...for relatively small amounts of produce” (PM12). Another grower (PM13) also noted that the Cooperative was replacing his need to travel as far by distributing his products for him. By providing distribution, marketing, and transportation for local producers, the Co-op saves producer members’ time as well as money.

Six of the 15 farmers interviewed noted saving time through Co-op membership. One farmer explained that marketing and distribution, “requires so much of my time, and I’d prefer to be growing and putting the distribution and marketing to the Co-op so, I guess to me, the margin that the Co-op requires in order to function is worth it” (PM16). The “margin” refers to the sales margin on goods sold through the WMGC, which differs depending on the product being marketed.

In addition to offering transportation and distribution of products sold through the Co-op, the WMGC also offers basic freight services to some members who choose to pursue direct sales. One member uses this freight service and describes the benefit of it this way: “It takes time to run here, there, and everywhere to deliver [my goods]. Letting the Co-op do some distribution makes good sense from my end and it also helps the Co-op’s bottom line” (PM8). Another member also described using the WMGC for this freight service: “We do all the sales and the order...directly with the Good Food Store, and then the Co-op just charges us freight to deliver

them, which is a lot lower of a margin and makes sense financially for us” (PM5). This benefit of freight transport through the Co-op illustrates how, for some growers, their relationship with the Co-op is fairly utilitarian and business-oriented. One grower expressed this clearly: “In a sense, they’re just another customer for us” (PM15). However, one grower who uses the Co-op as simply freight service noted that this relationship “also helps the Co-op’s bottom line” (PM8). Use of the Co-op as a freight service can thus be interpreted in a couple of ways. First, some members appear to be more interested in direct sales outside of the Co-op and perceive the WMGC primarily as a distribution company. Secondly, those members shipping freight want to support the Co-op financially, even though they are choosing to sell some of their products directly to buyers.

Benefits of Aggregation. Aggregation of goods was another frequently cited benefit of Co-op membership, noted explicitly by 40% of farmers interviewed. The WMGC’s ability to aggregate members’ produce and sell a larger quantity of various items allows small farmers access to larger markets. Members who addressed this benefit noted the difficulty of being a small farmer and trying to market to stores and institutions that are used to buying from large distributors. For example, one interviewee stated that buyers “wouldn’t want to come and buy from you when they can buy it from Sysco or from other people that are a lot bigger” (PM13). Another member described several benefits of WMGC’s aggregation, explaining, “I think Western Montana Growers serves that purpose...of aggregating a lot of agricultural products and distributing them to restaurants, to stores, to buying clubs, because it’s just either financially feasible or kind of physically feasible, logistically feasible” (PM15).

Financial Benefits of Expanded Markets. The most frequently mentioned benefit was the Co-op’s ability to provide access to new markets that had previously been unavailable to members, a benefit also related to the Co-op’s distribution services. Eleven of the 15 farmers expressed that they have accessed new markets since becoming a WMGC member. One grower explained that, “It is because of [the Co-op]...that many restaurants, small grocery stores, places like that get our [product] that never got them before, because we don’t have the man power” (PM4). This same farmer later added, “They have gotten us into stores that wouldn’t accept us before, so I give them credit for that.” Another member agreed with this sentiment: “They go all over Western Montana, you know all the way over to Billings and up to Whitefish and down in the Bitterroot. And some stuff you can get back hauled through Charlie’s like over into Spokane” (PM5). The importance and necessity of these new markets to the producer members was summed up well by one interviewee, who said, “I know that if small farmers want to survive economically...we have to go outside of our local region...for that, I depend on the Co-op” (PM16).

Financial Benefits of Resource Sharing. A benefit noted by two interviewees is that the Co-op is more efficient in terms of overall resource use. Specifically, growers noted that the aggregation of many farmers' goods onto one truck reduces fuel usage, which is a positive outcome. One farmer reflected that the WMGC distribution system makes the shipment of their products more economically viable than other shipment methods. He described how the WMGC is saving thousands of miles in food transportation:

It would be less expensive for the Good Food Store to buy from UNFI [United Natural Foods Inc.] than it would be to buy from us directly and have us ship it over by UPS or FedEx ground, a 100 pounds once a week...Western Montana Growers Co-op...fills that niche and having the opportunity and ability to actually supply Montana grown [products], in our case, to a store in Missoula...They're [the Co-op] gonna be able to do that with 2300 miles less diesel fuel than it would by using a national distributor (PM15).

A Sense of Community

Along with noting the financial benefits of membership, several producers described experiencing empathic relationships with other farmers and a sense of community that comes with being a WMGC member. For participants, this sense of community revolved around shared values, personal interactions, staff appreciation, and opportunities for knowledge-sharing.

Connection and Shared Values among Members. Nine of the 15 members interviewed described the member community as a key benefit of the WMGC. One farmer described the value of connections, "I like it because I like being part of a group of farmers. I feel like the community of farmers is small and there are not very many other people that understand what you do with your day and I like that" (PM15). Another member observed, "Our main personal interest in it [the WMGC] is not our direct income, but it's our participation in a network of farmers" (PM12). One interviewee described the WMGC as a sort of "family" stating,

The Co-op, that's our brothers and sisters, that's who we really need to support. And the more we can push through there...the better for everybody...I really feel like we need to make that thing work (PM17B).

The sense of community that the WMGC inspires is, in part, rooted in the shared values held by Co-op producer members. Four interviewees mentioned that the Co-op fits with their values of supporting a local food system, indicating that a benefit of membership for them is not only financial, but also values-based. One interviewee stated that, "Being local, we want to sell as much of our product locally and that's what we're trying to do together" (PM11). Another

grower explained, “Our mission is to participate and help support a more sustainable food system and Western Montana Growers is a model for how that can be done” (PM15). These sentiments of selling local and supporting a sustainable food system illustrate that the participation of farmers in the Co-op is values-based as well as motivated by financial benefits of membership.

Personal Interactions among Farmers. An additional benefit of membership noted by several interviewees was that of having personal interactions with other farmers through WMGC-facilitated gatherings. Face-to-face meetings among members contribute to the sense of community; yet, not all members who expressed that the WMGC provides a stronger farmer community regularly attend the WMGC annual meetings, typically held in January. Attendance at these meetings is not mandatory, but was described as a benefit by 3 members interviewed. Similarly, monthly board meetings were mentioned as a beneficial part of the WMGC community. One member who has been in a governance position connected this with her sense of Co-op involvement, stating, “I feel much more connected to...our greater picture of what’s going on with sustainable farming in Western Montana...I think I wouldn’t have if I weren’t a Co-op member and on the board” (PM5). These in-person meetings seem to benefit members because they add to the sense of cooperation and community. Since the members work together to determine commitments for what each will produce for the upcoming season, this benefit also reflects the importance of having Co-op members actively participate in information sharing and decision-making.

Appreciation of Staff Time and Dedication. A recurring theme in producer member interviews was growers appreciation for the WMGC staff’s dedication and work ethic. This appreciation was mentioned among other “benefits of membership,” indicating that growers understand the importance of staff in overall Co-op success and functioning. As one member put it:

Awesome to work with. Really good...I know Dave and Jim work so hard. And they work at night sorting produce and putting it together for people and of course they accept our product the way we sell it...which means that they have to do the work...So they’ve been awesome (PM4).

Six members specifically mentioned the staff as one of the biggest benefits of WMGC membership. In several interviews, members also noted that the staff is underpaid and at risk of “burning out.” One grower explained: “I also don’t think the staff is paid enough for all the work they do” (PM2). Producer members simultaneously recognize the value of the Co-op’s dedicated staff as well as the unsustainability of their current operating situation. One farmer described the stress on the Co-op and the staff: “The [staff] don’t have benefits. They don’t get

paid much. They don't have health insurance. They work long hard hours" (PM6). Thus, members seem aware that the current situation for staff is unsustainable and that losing WMGC employees would have a major impact on membership benefits.

Knowledge Sharing among Members. Another community-related benefit described by members is the opportunity for knowledge sharing among farmers that Co-op membership provides. This benefit was mentioned by two members, both of whom spoke of the Co-op's role in supporting new farmers through planning and crop information and with emotional support. One interviewee described a somewhat formal process of knowledge sharing that has taken place between WMGC staff and producers:

Dave or Jim, or maybe another grower, would work with the person to help that process, see where the barriers to having the quality that's needed, see where the barriers lie, and have some established person who's familiar with that help them through the hoops (PM12).

In this way, more experienced farmers are able to encourage young farmers and also ensure the product quality that they expect all WMGC members to meet. Aside from knowledge sharing, three farmers mentioned other ways the WMGC's support of new farmers is a benefit of membership. One member explained, "Our main personal interest in it is...encouragement for new farmers to get started...because I think it is a major help for people who are new to doing this and who don't have long established contacts with outlets" (PM12). In addition to new growers receiving the benefit of education and informational support, more experienced growers expressed that seeing new growers receive the support they need is an additional benefit of membership. The ideal of creating a supportive farming community and a "noncompetitive" attitude within the WMGC is one that members seem to support. Their emphasis on empathic relationships and an appreciation for a community of farmers suggests that financial gains are not the only thing of value to WMGC producer members.

Convenience and Efficiency of WMGC Membership

Less frequently mentioned than the financial or community-related benefits were comments related to the convenience and efficiency of working with the WMGC. The convenience of drop-off sites for produce was noted by two members, with one farmer describing how his membership in the WMGC makes what would otherwise be a prohibitive part of farming instead quite easy: "The fact that there's this drop point, and it's only five miles away, that part

is not onerous” (PM12). A second convenience noted by two members is the online ordering system the WMGC uses to receive and fill orders. One producer stated:

[Online ordering] is easier for us to make offers, just that it enhances communication both ways cause we can put in offers more easily. It doesn't involve the time and complexity of individually contacting by phone, which can be awkward. This way, if 10 people want at the same time to put in their offers, or check on what the sales were, there's no limitation...If you eliminated the internet...from this, it would be much harder to see it working on this scale (PM12).

WMGC Benefits Related to Production Planning

Lastly, production planning was mentioned by a small number of members as being beneficial to their farm operations. Two members noted that WMGC membership enhances the crop variety on their farm and that they see this as a benefit of membership accomplished through production planning for Co-op sales. One farmer described how the WMGC “allows me to grow some crops that I can't sell as much as I'd like through other means” (PM2).

Only one member mentioned the CSA as a benefit of the WMGC, which was unexpected as it is about 10% of the Co-op's annual sales and appears to be a significant part of guaranteed sales. This member felt that the benefit of the CSA is that it facilitates “the direct involvement of the consumer.” Other benefits mentioned by only one member and have not yet been discussed in this section include: the ease of accounting, receiving feedback from consumers, the professionalism of the Co-op's interactions with buyers, reduced competition between farmers, meeting other members monthly for board meetings, providing financial security, and saving some manual labor that the member would otherwise be required to do.

Benefits Summary

Participants in this study clearly articulated benefits of membership associated with the Co-op's ability to effectively aggregate, market, and transport their products. Growers particularly noted the benefit of working with the Co-op in establishing new markets and markets with which they would otherwise have difficulty working due to the volume of produce needed or marketing effort required. Our interviews also revealed the importance of the sense of community and shared values among producers. Growers feel a key benefit of Co-op membership is their feeling of connection to a larger food movement and their ability to participate in a local food system. Overall, benefits of Co-op membership are clearly not just related to increased farm business viability and success, but also relate to the sense of community and participation in a values-based food system important to producer-members.

Members' Perceived Challenges

Introduction

Members' experiences and perceptions of challenges within the Western Montana Growers Co-op are significant because member dissatisfaction, if not addressed, could lead to reduced membership and tension within the organization. In this section, the focus is on the challenges faced by individual members in their experience with the Co-op. To understand what challenges exist for members in working with the Co-op, our research team asked growers, "As a member of the Co-op, what challenges have you experienced?" In response, producers identified challenges faced in their interactions with WMGC, challenges they experience with other producers, and challenges they face as farmers that do not necessarily relate to Co-op membership. Three interviewees did not identify any challenges in their business or personal experiences with the Co-op, though all growers did describe general concerns with the Co-op as a whole. The following challenges, listed in descending order of frequency mentioned, are the general categories that three or more producers discussed:

- Inaccurate sales projections;
- Competition between members within the Co-op for growing commitments;
- Competition between the Co-op and members who sell outside the Co-op to the same markets;
- Sales and pick-up schedule is too short; and
- The 25% sales margin.

Inaccurate Sales Projections

The challenge most frequently mentioned among member producers was inaccurate sales projections by the Co-op that results in food produced but not sold. At the beginning of each year, the Co-op provides sales projections for the upcoming farming season in which crop sales predictions are made. Based on these projections, farmers then make commitments to grow these crops for the Co-op to market and distribute. Of the 15 producers interviewed, seven identified inaccurate projections as a challenge due to their crops/commitments not being sold. In describing this challenge, one producer explained, "We committed to what they wanted us to grow and they didn't buy it" (PM17). A second grower commented, "Everybody is so dang busy. Inevitably what happens is that we don't do our planning right as a group and then somebody grows something, somebody grows too much of one thing, then you basically eat it because you can't get rid of it" (PM3). One interviewee explained that inaccuracies in projections and commitments are hardest on producers who grow exclusively for the WGMC,

as these particular growers have fewer markets to solicit if they are left with food the Co-op cannot sell (PM3).

Competition between Members for Crops and Commitments

Currently, producers with a history of providing specific crops get the priority in the following year's commitments (PM8). Five producers identified competition among members to grow certain crops (seasonal crop commitments) for the Co-op as a challenge. One grower noted, "It's hard to sell what you have now that there's so many people all growing the same thing" (PM2). Another member noted, "Now that we have a priority, or hierarchical system, I guess there are things that I would want to grow but someone else is already growing them" (PM16). One producer expressed frustration with the way crop commitments are assigned and how this may or may not act as an incentive for greater Co-op commitment among members:

I guess another frustration... is the whole commitment thing and these really desirable crops being sucked up... by other farmers and you want them and you feel like you're really good Co-op members and want to grow more of certain crops and sometimes commitments can be held by farms even when their quality sucks. And that's super frustrating (PM19).

According to the producers we interviewed, commitments are distributed among members without considering the extent to which a producer is involved or engaged in the Co-op or the quality of the product that has been produced in the past.

Competition in the Marketplace between Members and the Co-op

Four of fifteen members interviewed identified competition between Co-op members and the Co-op (because of direct sales by producers) as being a challenge. For several producers, the challenge of competition with other members selling outside of the Co-op is very significant. One grower commented that, "It causes bad feelings...I was recently having a conversation with (anonymous) and that person was explaining this to me how the Co-op can't possibly continue the way it's going if the members aren't going to support it by handing over their stuff" (PM6). The Co-op has steadily grown since first starting in 2003, but some members see the competition between the Co-op and some of its members as being a major barrier to further growth. One grower stated, "Or, if they're competing with the Co-op too, if they're competitive with the Co-op and they still hold a commitment on a crop that we would like to grow...That's super annoying" (PM19). This farmer elaborated on this concept, explaining:

So, you know, they take one crop and they sell it direct themselves in Missoula, but then they still get the commitment priority with the Co-op, so they're getting

all the far away markets too and so, not only do we not get the Missoula market, but we don't get any of the markets (PM19).

Some members feel that those producers who sell through the Co-op and who also direct market their produce are acting unfairly towards other producer members.

In contrast, two producers specifically stated direct sales to the same markets as the Co-op was not an issue. One farmer stated:

Well, if we direct market, we get more return. We basically can sell directly, roughly the same price that the Co-op is selling, and so for markets where we have established relations, sometimes we sell to them directly things that we're also selling through the Co-op and we don't see that as conflict (PM12).

Direct marketing brings a producer a premium for their product because they do not have to pay the Co-op the 25% sales margin charged for its services. Further, some members are reluctant to end long-term relationships with some markets and this influences their decision to continue with direct sales. The combination of established relations with buyers along with being able to earn more profit through direct sales are believed to be sufficient reasons to continue direct marketing efforts among growers. One producer member views the Co-op as being in competition with his/her farm in the marketplace, explaining, "I feel that the Co-op has taken away some of my business, so by joining the Co-op I'm trying to make up for that amount of money that I'm not making" (PM2). This reveals how producers may see the Co-op as both supporting and challenging their businesses.

Tight Schedule between Sales and Pick-up

Three of the 15 members interviewed identified the current system that the Co-op uses to facilitate sales and to pick-up goods as a challenge. The WMGC does all sales on Monday morning and makes its offers to farmers so that they can harvest that afternoon and drop the goods off at the drop points in the evening (PM2). On the topic of ordering, scheduling, and delivery, one producer commented, "The Co-op is a pain... we get the order on Monday and have to deliver on Monday" (PM17). In contrast, one producer noted the quick turnaround and accompanying stress of the current ordering and harvesting system (PM12).

25% Sales Margin

The Co-op sells members' products at a 25% margin in order to cover operating costs. Three producers mentioned the margin in their interviews as being a "challenge" of Co-op membership. When commenting on the margin, producers noted that small-scale farming and

production is financially challenging even with the Co-op increasing marketing and making delivery more efficient. The financial challenge of farm operation is what inspires growers to avoid the margin when possible by using direct sales. One producer commented on this, stating, “It’s that time of year, late fall, when things are slow enough around here we can drive down to Missoula a couple times a week and...it’s worth it for us because the difference is such a huge difference at 25% on that. We just flat out need the money” (PM5).

Irregular Quality & Packaging

One challenge identified by two interviewees was the issue of poor packaging quality and sometimes poor product quality by some producers that reflects negatively on the Co-op as a whole. One grower explained, “I kind of hate to see our stuff, that I’m very proud of, lumped together with other stuff that, if I boxed it up, I would be less proud of. That’s always a big issue for me...I still feel like it effects the whole order in a negative sort of way, which includes our stuff sometimes” (PM19). Although the Co-op can reject a farm’s goods due to low quality, it is often impossible for staff to inspect all the goods distributed due to staffing and time limitations (PM19). Products of poor quality can reflect on other producers of the same goods when aggregated for distribution. A second grower identified this same challenge, noting that, “We just re-use wax boxes that we get from the produce venues like Good Food Store...they don’t look good. They’re not uniform... A lot of times they’re kind of junky. They fall apart. They rip and they just don’t look like... you see a pallet of our stuff... it doesn’t look professional” (PM5). Two producer members feel that the Co-op is not presenting itself professionally with poor quality of product and with poor quality of boxes, both of which affect all members.

Other Challenges

Two producer members identified various issues associated with the Community Supported Agriculture (CSA) that the Co-op offers. One member feels that the CSA makes crop planning challenging because, “they only want things once every third week” (PM2). A second member views the CSA as “not of real help to the Co-op because...what the Co-op does really well is wholesaling, and it’s too much individual consumer outreach...I think that’s what a store does very well and a farmers’ market does very well” (PM12). Two interviewees identified challenges with equipment, both of them noting in particular issues with trucks and the cooler as being key challenges the Co-op seems to face (PM 4, 6).

An additional six challenges were identified in interviews with producer members that were unique to individual farms. These challenges include: the expense of packaging, lack of incentive for selling through the Co-op, transportation to pick-up point (producer doesn’t drive), Co-op board not effective in completing duties, punctuality of Co-op drivers during pick-up and delivery, and low beef sales by the Co-op. Although these challenges were unique to a single

producer, that does not mean that they are insignificant or that they may not also be shared by growers who have yet to be interviewed. Interviewees also made general observations about Co-op operations that they see as being potential challenges but that do not necessarily relate to their businesses. These included: lack of communication among growers and between board and producers; poor marketing; lack of member engagement; and staffing issues.

Challenges Summary

Pre-Season Planning. Considering that the two most frequently cited challenges pertain to pre-season planning, this may be an indication that some additional time and energy could be dedicated to this aspect of Co-op operations. As noted earlier, 62% of all Co-op members grow vegetables, while vegetables account for only 32% of annual sales, potentially accounting for the perception of competition for crop commitments among producers. Based on some of the comments made during interviews, we recommend that some additional time be taken to explain how crop commitments are handled and how planning can be done more effectively in order to address these feelings of competition and poor planning.

The Co-op is Divided. Another challenge noted by growers is the issue of competition both among growers within the Co-op for crop commitments and between the Co-op and members who choose to use direct sales while also selling through the Co-op. Out of the 15 farms interviewed, a total of six, or 40%, specifically referenced this topic. Members described feeling affected by this conflict in two ways: First, growers indicated that direct sales prevent Co-op growth and increased sales by occupying some of the markets the Co-op might serve were it not for direct sales by individual growers. Second, some growers are frustrated that other members are simultaneously selling outside the Co-op while simultaneously claiming desirable crop commitments that others feel should be given to more “committed” Co-op producers.

Contrasting these views are two producers who do not see a conflict. Growers who did not share these concerns feel that the premium prices earned through direct sales compensate for any conflict between their business and the Co-op and that maintaining relationships with businesses through direct sales is a priority for them. Clearly, members are divided on the impact and logic behind direct sales, making it a particularly relevant issue for discussion and problem-solving as the Co-op continues to improve its cohesion and operations.

Member Engagement & Commitment

Introduction

Communication among various tiers of management within a business is a challenging endeavor. In a cooperative business, where the members are owners and operators,

communication is a critical function for successful and fair operation. Communication is also a means to establish member involvement and, in turn, commitment. The subject of communication within the Cooperative was specifically raised during our in-depth interviews, though responses described below include other answers that still address the topic of communication. Specific we discuss how the Co-op's Board of Directors communicates with the members; member involvement within the Co-op; and the resulting commitment of the Co-op members to the success of the WMGC.

Board Communication & Member Participation in Governance

According to the 2011 Business Plan, there are currently seven members of the WMGC board, all of whom are producer members. One member who plays a leadership role in the Co-op stated that new board members are elected every three years during an annual member meeting. Each member of the Co-op has a right to vote, the opportunity to serve on the board, and ultimately the ability to influence the decisions and directions of the organization.

General Member Participation at Board Meetings. Open communication between the board and producer members plays a role in determining the success of the participatory ownership model of the Co-op. The board is volunteer-based and members are encouraged to attend the board meetings to discuss operational matters. However, most of the producer members we interviewed, including those who have played a leadership role in the Co-op, expressed difficulties in including producer members in the board meetings. Two of the producer members we interviewed, both of whom have served on the Co-op board, stated that it is difficult to engage members. One explained, "We've got a really good board, and they do a lot of volunteer work. It's all volunteer, but it's really hard to get other members involved that aren't on the board. Anyone who's a member is welcome to come [to the board meetings]" (PM5). Another member, who used to play a leadership role in the Co-op, explained: "It gets a little much when non-board members show up and they don't know the history of the topic...so unless you have a connection with someone on the board, it's a little hard to figure out exactly what's going on and I don't like that part" (PM12).

Members who have not played a leadership role in the Co-op also expressed lack of interest or motivation in attending board meetings. According to Jan Tusick, Center Director for Mission Mountain Food Enterprise Center, cooperatives are, "user-owned, user-controlled, and user-benefitting." The best opportunity for producer members to become involved in the ownership and control of a cooperative is to participate in their shared governance model, most directly by attending board meetings or serving on the Board of Directors. However, at least 6 out of the 15 members we interviewed expressed a lack of interest in or time for attending the board meetings. One farmer stated, "I just grow and sell, and I don't really pay too much attention

about the government” (PM18). Members also expressed the need to spend their free time with family or running their business. When asked how they feel the board communicates with producer members, one farmer stated, “I’m the worst to ask because they have meetings on Saturdays, well, I like to spend time with my kids so I don’t go to the meetings” (PM13). Since board meetings are actually during the week, this answer might suggest that the board does not regularly communicate the dates of their board meetings with the entire membership.

WMGC members can participate as much or as little as they want in the governance of the Co-op. When asked about board communication with members, one producer stated, “Probably good enough. They publish the minutes of their meeting. You can go to a meeting. You can have as much to do with it as you want. There aren’t any secrets” (PM6). Some members mentioned that participation in Co-op governance is unequal among growers, with some producers putting in regular attendance and others participating minimally. As one put it: “There’s a core group of people that go to the meetings or come to the annual meeting, and there’s some people that you never see and you just don’t know how interested they are” (PM3). Another member discussed common interests, saying, “I know most of the Co-op members that are running the Co-op work as farmers, are farmers. I think that’s good. I think that the board should be farmers. The people running the Co-op should understand what farming is all about. If they don’t, they should come out and work with us one day and understand the issues” (PM11).

Communication between the Board and the Membership. Examples of the difficulties communicating with the board did come through in the interviews. When asked how they think the board communicates with members, 4 out of the 15 farmers we interviewed expressed overall disappointment in communication between the board and Co-op members. One farmer responded, “Actually, terribly. It’s really something that I would like to see changed. I mean, unless you’re on the board, you really have no idea what’s going on” (PM12). Similarly, another producer stated, “I don’t think they do communicate to us anymore. We used to get a letter every few months, but I haven’t received one recently. I don’t even know rightly who’s on the board these days. So there’s not a lot of communication.... Maybe the board doesn’t do a lot, I don’t know” (PM8). One farmer responded bluntly, “Poorly. The only time that I hear from them is when they’re having their annual meeting, or maybe it’s a semi-annual meeting, I don’t know. And again we’re geographically... we’re distanced to the point that it’s not a convenience for me to get to the meetings” (PM15).

Besides geographical distance, board members noted that not all members have email access, making communication even more challenging. One farmer who has played a leadership role in the Co-op stated, “Yeah, I’d say we could definitely communicate better with the membership.

We can send out, you know, kind of blanket emails to our membership. But not all of our members are even on-line. We do send out letters occasionally if there's really important things we need to get across" (PM5).

The lack of participation in the governance of the Co-op was frustrating to a few of the interviewees. One farmer who has played a leadership role in the Co-op said, "A lot of our members kind of just see us as a distribution service and don't want to put in any extra time or energy into making it work. Even though it's their business, I think a lot of people don't understand...they kind of view it as a separate entity, when really if you're a member, then you're an owner" (PM5). On the other hand, a few members expressed that they hadn't heard anything from the board for a while. One member stated, "I don't even know when the annual meeting is. There's supposed to be one in November, maybe they haven't set it up yet. And then after the meeting they take all the information and write a letter for the minutes and I don't get [anything] from the board anymore" (PM13).

Member Communication with Staff. Many members shared that their frequent communication with the staff, rather than the board, keeps them informed of Co-op business. Because of apparent communication challenges, members often contact the Co-op staff for information rather than board members. One member stated, "I don't know what's going on, because I don't get anything. And maybe I need to make a call and find out. I talked to Dave about it and it's going smooth" (PM13). Another producer member who has played a leadership role in the Co-op stated, "We've tried at different times, but then the board changes and the people who are doing it aren't there, and maybe, I know one board member said that they thought Jim and Dave were doing such a good job that there's not even really any need for a board. But, of course, there is structurally" (PM16). Another producer stated, "What communication we get usually comes through Dave Prather. He'll shoot us an email if there's something that is a major importance I guess, but we don't get a lot of communication" (PM8).

Member engagement

Trainings and Work Parties. Throughout the years of operation, the Co-op's Board of Directors has made attempts to organize trainings and work parties with producer members in order to communicate standards and engage new members of the Co-op. Three of the producer members we interviewed discussed these trainings and the work parties in their interviews. In the past, these trainings aimed to build community and cohesiveness within the Co-op, and were viewed by members as a communication tool. The trainings were started with the inception of the Co-op. One producer member explained,

There was a protocol for whenever a new member wanted to come in. Basically, we needed to have quality produce and consistency...people would join, and they wanted us to sell their product, so we would see if they were a good fit. If they were real gung ho young people that didn't know much about it, we would try to assign a local grower that would try to do that. That was important, because it gave a morale boost to the new grower (PM3).

The trainings were not required or very formal, according to one producer: "Sometimes, it's been direct visiting from an established producer to a, say a new producer. Sometimes it's more informal, just communication between the growers" (PM16).

A fourth farmer suggested that a training might be useful in helping members understand the Co-op's structure and role, stating, "I think for new members and beginning folks there needs to be some 'welcome to Wholesale 101,' 'this is what we expect of you'...members could teach the class" (PM19). This farmer continued by saying that members could teach these trainings, and the training time could count as volunteer hours. Trainings such as these for all members could help Co-op members understand the role of the Co-op in creating a farmer-owned distribution service, as well as the bylaws and overall operations and structure. Many of the new producers to the Co-op used to be supported by the more experienced growers of the Co-op. One producer mentioned, "When we were recruiting all of these new growers, they weren't used to what the market [requires], as far as handling and boxes and grading your vegetables. So we used to put out a packet with that, and that kind of came and went depending on how much time the marketer had.... And then there was also basically an informal crop improvement association within the Co-op for new growers where several members would go out to a new member and try to help them" (PM3).

In the past, the Co-op also organized occasional work parties. These provided another opportunity for producer members to become engaged in the Co-op. As one member explained, "We haven't so much in the last couple years, but in the beginning for sure, we were having a lot, needing to have a lot of work parties" (PM12). However, this same member emphasized the lack of participation in these activities, saying, "The only people who volunteer are the people on the board because they're the only ones who know about it; they're sort of the ones that feel more responsible" (PM12). According to this producer member, these work parties included things like infrastructure upgrades for the Co-op such as installing coolers in the storage space.

Newsletter Communication. Nearly half (7 out of 15) of the producer members we interviewed also mentioned the fact that the Western Montana Growers Co-op used to put out a newsletter

to communicate with the Co-op members. However, 5 out of the 15 interviewees also noted that the lapse in newsletters was likely due to staff and board being overwhelmed and too busy. Among the interviewees, there was confusion about the current status of the newsletter; however, they mentioned that they enjoyed the newsletter and saw it as a communication tool to stay in touch with the Co-op. According to one producer member, "They [newsletters] were just kind of keeping you up to date on what's going on and the board members and who they are, and just how things were going to operate" (PM13).

Some members have helped out in the past, but there are challenges in keeping a newsletter going, especially when there are one or two new board members elected every year. Producer members understood the complications of keeping a newsletter going. While discussing the upkeep of the Co-op newsletter, one producer member mentioned, "It's really hard for the management, because they are kind of over worked and under paid" (PM3). One farmer who has played a leadership role in the Co-op also mentioned, "There's not usually a ton of news. Once a month would be too much. Maybe a quarterly newsletter would be good" (PM5). Two members mentioned that a former board member used to put together the newsletters, which answered many of the questions members had regarding the status of the Co-op. According to these interviewees they view the board as being responsible for the production of the newsletter. Since 7 out of 15 of the interviewees mentioned the newsletter when communication within the Co-op was brought up, this is apparently an important communication piece between producer members and the Co-op board and staff.

Annual Meeting. The Co-op's Annual Meeting is another opportunity for the staff to share an overview of how the year went, discuss finances with members, and address any issues within the Co-op. However, member participation has often been low or infrequent. At the annual meeting, general membership is welcome to bring up any topics they would like to discuss. Members are also asked to vote on any policy changes, changes in the by-laws, and new board members are voted in. The Co-op's annual meeting serves as a platform for member involvement and participation, but, in many cases, participation in the annual meeting is relatively low. According to one farmer who has played a leadership role in the Co-op, "I'd say maybe a quarter or a third of members show up every year" (PM5). Reasons for not attending and a lack of interest in the annual meetings were prevalent in our interviews, especially when compared to just a few benefits related to attending the annual meeting.

Producer members had many reasons for not attending the annual meeting. Some were just too busy, while others were frustrated by the structure of the meetings. However, 3 out of the 15 farmers interviewed mentioned the benefits and importance of the annual meetings. The number of members who do not regularly attend the annual meeting was surprising. Only 5 out

of the 15 producers interviewed said that they regularly attend the annual meetings. Out of the 15 member interviews, even those who rely on the Co-op for a majority of their sales have only been to the Co-op annual meeting one time.

Investment in the Success of the Co-op

The WMGC, because it is a cooperative, is intended to work as a participatory organization. Commitment to the cooperative model serves as a model for success. We have discussed the involvement of producer members in the Co-op board and annual meetings, as well as communication between the board, staff, and producer members. During the interviews, we also asked to what extent producer members feel invested in the Co-op's success. Not surprisingly, a majority (10 out of 15) of the farmers interviewed expressed that they were definitely invested in the success of the Co-op. One member stated that, "We'd do anything to help them out" (PM4). Another farmer answered, "Yeah, [we are] super invested. It would be super challenging for us to, basically, redefine our business if the Co-op wasn't here" (PM19). Farmers also really appreciate the community that comes with the Co-op. One producer mentioned, "I feel totally committed to the Co-op and really invested.... I guess it comes back to being able to grow food and get it into lots of different local markets, and being a part of something a little bit larger than what our farm is. That part is important to me and having something that is owned by the growers is really important to me and not selling to a distributor" (PM16).

A few (3 out of 15) members said that they were just "fairly" invested in the success of the Co-op. One farmer stated, "I'm fairly committed. I believe in their mission...if one of the small accounts the Co-op has a problem, it's not a major problem for either the Co-op or myself. You know, you can always go find somebody that can take a couple [product]" (PM8). Another 2 out of the 15 farmers we interviewed admitted to being unsure of their commitment to the Co-op model. One of these producers admitted to using the Co-op strictly as a distribution service (PM6). The other producer mentioned, "I don't know that the Co-op is such a good fit for me. But then, it feels weird for me to think that oh, I would need to sell harder to these places where the Co-op is selling. I don't want to hurt the Co-op. But, I also feel like, I don't know, I had these accounts before there was a Co-op" (PM2).

Throughout the interviews, we found that loyalty, commitment to the cooperative model, and a sense of ownership all factored into how invested a member was to the success of the Co-op.

A Sense of Loyalty. A couple of the producer members interviewed have been with the Co-op since its inception and therefore expressed a sense of loyalty to seeing the Co-op succeed. A tenured member of the WMGC stated, "Over the years, you kind of come to feel like you

belong” (PM18). One producer member had even been approached by other distributors but stated that they decided to stick with the WMGC out of a sense of loyalty. This producer appreciates the longevity of their relationship with the Co-op and values the staff and other growers enough to continue working with the Co-op (PM14). Other producer members expressed a sort of nostalgia for and ownership of the Co-op. One long-time producer member stated, “We've watched them grow! You know, we've been a member right from the very beginning and we've watched them grow and get more organized” (PM4).

Being involved with the governance of the Co-op has also played a role in the loyalty producer members feel for the WMGC. One farmer who has played a leadership role in the Co-op explained that:

Being on the board really sort of enhanced that commitment. Just getting to know the inner workings of it as a business and understanding the struggles that we face feels like, in that way, I want to see it succeed. And now that it has grown so big, it seems to be such an important part of our community that I wouldn't want to do anything to jeopardize that so, that's why I want to put all effort into it (PM12).

Commitment to the Cooperative Model. Besides being loyal to the Co-op, several members also expressed commitment to the Cooperative model. The Cooperative model involves producers, the distribution business, and retail outlets. Since one of the challenges of farming in Western Montana is the geographic distance between markets and growers, a few farmers recognized the importance of the WMGC in this region of the state. Many (6 out of 15) of the producer members mentioned their commitment to the mission of the WMGC model. One member stated, “I am very supportive of the model, of the Cooperative model. I just think that makes a lot of sense” (PM15). Another producer explained, “That part is important to me and having something that's owned by the growers is really important to me and not selling to a distributor” (PM12). Another farmer also recognized the role the Cooperative model plays in Western Montana's food system. She stated, “By being a member of the Co-op I'm helping to supply local food to Western Montana in a way that wouldn't be possible without the Co-op” (PM5). By being supportive of the Cooperative model, these members are helping to supply local food through a distribution service that is owned and operated by those producing the products.

A Sense of Ownership. Members' degree of commitment to the Cooperative was also illustrated by the personal pronouns that our interviewees used when discussing the Co-op (“they” versus “we”). By definition, a cooperative business is an organization owned and operated by a group of users for their own benefit. Each member is inherently an owner of the

Cooperative, but feelings of ownership are not necessarily shared by all members. Members referenced the Co-op using both first person and third person possessive pronouns. For example, during the interview process, nearly all of the producer members would talk about the WMGC by referring to the staff that does the distribution and business side of the operations (“they”). By contrast, producer members who either had been on or were connected to the board used the word “we” when discussing the decisions and governance of the Co-op. One of the farmers even alluded to this tendency stating,

I think that most of the members look at the Co-op as passive customers to the Co-op as opposed to members...you just look at it as the language; they call the Co-op something other, it’s not like *our* business or anything like that. It’s ‘they’ want it, ‘they’ want it. You always refer to the Co-op as ‘they’ or ‘them,’ and even in a weird kind of way, we all compete a little with the Co-op...because none of us sell everything to the Co-op (PM17).

Another mentioned, “I think sometimes people confuse that role [of the Co-op], and get the inverse, like, not ‘what can I do for the Co-op,’ but ‘what can the Co-op do for me?’” (PM19).

Producer members who seemed to have no interest in the board meetings or annual meetings mostly used “they” when referring to the Co-op. Those producer members consistently talked about the staff of the Co-op and never about the Co-op membership as a whole. That many members look at the Co-op as if it is a customer, rather than as a business of which they are an owner, emerged in a number of the interviews. For example, one member stated, “They don’t ask much of us and we don’t ask much of them. In a sense, they’re just another customer for us.... Except for basically the philosophical commitment to changing a food system in Montana, they don’t offer any additional benefits to us that a non-Co-op distribution [company] would or another customer that was out of state. Their relationship is really pretty straight forward” (PM15). The disconnect between a successful farm business and the success of the cooperative model also sheds light on the lack of participation and investment in the success of the Co-op that was mentioned earlier. Although not intentional, a general lack of engagement and participation comes through in these statements.

Interestingly, some members who do not seem to want to play a governance role in the Co-op referenced the Co-op in a first person possessive form, “we,” when discussing the overall success of the Co-op. For instance, one member expressed a sense of ownership by saying, “We don’t even pay our way; I think somebody gives us office space. And somebody gave us start-up money...” (PM6). Occasionally, interviewees would switch between referring to the staff (“they”) or the Co-op (“we”) in their statements. One farmer stated, “Every winter they have to borrow

money from members to get through the winter, so it's not like there's a lot of cash floating around. I do think it's something we should work towards soon or we don't deserve to have these really loyal guys selling our stuff" (PM2). The way this particular farmer seems to conceptualize the relationship between the Co-op membership and staff illustrates the complicated nature of Co-op ownership and the sense of commitment held by members.

Discussion

Engaged members will ultimately determine the success of the "user-owned, user-controlled, and user-benefitting" cooperative model. A few themes stood out while studying the commitment producer members have to the WMGC. While the majority of producer members we interviewed (10 out of 15) expressed investment in the success of the Co-op, few were actually engaged with the Co-op meetings and decisions. Focusing on trying to engage producer members in the operations of the WMGC on a regular basis will help to accomplish the mission of making the WMGC a farmer-owned and operated local food distribution service for Western Montana.

Regular Communication between the Board and Members. Board members should set up regular communication with the Co-op. There are many ways to communicate with the producer members of the Co-op. And while a few of the interviewees suggested that the board was doing a good job overall, others were concerned that the board was either over-worked or clueless as to what the board was currently up to. Regular communication through mail or e-mail to all members is recommended. Nearly half of the members we interviewed also brought up the fact that the Co-op used to put out a newsletter. This does not have to be every month, but creating a newsletter committee could also help with the communication between the board and general members. If the board feels that they already have too much on their plate, the close vicinity of the Co-op operations to the University of Montana also makes hiring an intern to put together a newsletter a possibility. The UM Environmental Studies Program is filled with students eager to learn more about Western Montana's local food system. Regular communication from the board to the members would also make the board more accessible and open to hearing suggestions from farmers. Keeping farmers up-to-date with current decisions will also make them more likely to attend the board meetings and annual meetings.

Monthly Work Commitments. Board members should set up some sort of commitment for producers to work for the Co-op on a monthly basis. While most farmers have very busy schedules, if they are going to benefit from the Co-op as a distribution service, the farmers should also contribute to the success of the Co-op with occasional volunteer time. One interviewee mentioned that teaching trainings could count towards volunteer hours. Requiring all members to volunteer as little as five hours per month could help out the over-worked,

under-paid staff tremendously. This could include anything from calling members, putting together e-mails, updating the sales sheets, coming in to help pack boxes, or even just attending a board meeting or two. Volunteer hours will not only help out the staff and board, but will also help provide transparency and understanding to the work that goes into the operations of the Co-op for the producer members.

The Future of the WMGC & Member Thoughts on Co-op Growth

In order to get a sense of member perceptions of Co-op growth, we asked interviewees if they believe that the Co-op needs to grow or expand. In addition, the research team also asked members about opportunities or services the Co-op could offer, about important steps for growth, about willingness to increase production, and what they want the Co-op to look like in five years. In response to these questions, and during responses to other questions, members discussed growth and areas for change at the broad Co-op level and at the individual farm level. When discussing Co-op growth, members brought up the following issues: increasing the number of buyers, more thoroughly saturating current markets, diversifying the kinds of products sold by the Co-op, necessary steps for growth, and increasing the number of producer members. When discussing individual growth, members shared their willingness to increase or change personal production to meet changing demands of the Co-op. The responses to these questions give insight into members' perceptions about growth and can help the Co-op grow in the ways that may be most beneficial to its members.

Growth at the Co-op Level

Despite having some reservations, the majority of producers feel some kind of growth is beneficial. Of the ten members that generally felt growth would be beneficial, one producer discussed the need to grow in terms of the ability to find an ideal financial balance: "I think that at some point we are going to find a sweet spot where we sell more and our expenses can stay relatively the same" (PM5). Even though most producers were in favor of growth, some discussed ambivalence, which seemed to be related to skepticism about the idea of growth in any context, not just with the Co-op. One producer who held this view stated, "Could grow, yes. Needs to grow, I don't know. It seems like we [society] get caught in that cycle" (PM16). Another producer agreed and also mentioned, "You don't want to be too big so that you lose the sense of community" (PM18). Another grower who felt ambivalent about growth did acknowledge, however, that the Co-op's growth up to this point has gone smoothly: "I feel like they've been really doing a good job and are probably growing at an adequate pace" (PM2). Members feel there is an opportunity for the Co-op to expand slowly and responsibly as they have been doing, but they believe growth should not trump other Co-op values.

As noted in earlier sections, members feel the Co-op offers an opportunity to get their products to buyers who are less likely to work with individual growers. Half of the producer members we interviewed felt the Co-op should play a role in pursuing these markets which make less economic sense for individual producers to access because of small returns in comparison to the effort required to reach and satisfy those markets individually. As discussed earlier, the Co-op functions as an aggregator, marketer, and distributor. Producers feel this advantage enables the Co-op to reach marginal markets that would be otherwise unattainable for smaller growers. One producer commented that, “If a store or an institution has an interest...in emphasizing local...food, they would really have problems if there weren’t a Co-op...making personal contact with the number of different farmers that are involved would be prohibitive” (PM16.) The Co-op’s three main roles provide an opportunity for growth in selling to buyers that seek local food but cannot logistically work with so many producers to acquire the volumes they need.

Apart from one producer who pursued buyers individually, the majority of members who said new markets were needed felt it was the role of the Co-op to identify and cultivate these new buyers, but members also recognized the difficult nature of this task and are empathetic to the Co-op obstacles. One producer stated, “I think there’s an opportunity for the Co-op to pursue more markets than they do. But that may be again one of those critical mass things where you can only go so many directions at once. For them to pursue more markets, it might be a major jump” (PM8). Members understand the difficulties associated with acquiring new buyers but feel confident that the Co-op can access new buyers for them due to the advantages of Co-op aggregation, distribution, and marketing.

New members could facilitate growth by producing greater volumes for the Co-op, and some current producers feel there is a need to train new members in order to standardize Co-op product quality. Several members pointed out the importance of the Co-op as a facilitator and educator for new producers during the process of growth: “I know there as an attempt to do at least some of that [education] for new growers, or people who were growing new crops that they hadn’t grown before” (PM12). In order to reduce uncertainty about the quality and quantity of crops producers deliver and ultimately to maintain the reliability of the Co-op for new buyers, education is necessary to ensure all producers meet commitments and deliver acceptable products.

In addition to feeling that there is a need for new buyers, members also discussed the need to fully utilize existing, easily accessible markets in Missoula. Some participants feel there is competition between Co-op members because the Co-op attempts to access the same markets that members also market to directly. In contrast, other participants felt like the sales potential

for these markets has not been met and that the Co-op could work to facilitate increased sales in these areas.

Accessing Premium Markets

The Co-op sells many products with local, Homegrown, or Organic certifications, which allow the items to be sold to consumers at higher prices. Some producers feel there is no more room for additional sales in these markets. Stores, restaurants, and institutions around Missoula that are willing to pay premium prices for certified Organic, Homegrown, and local products are limited, thus making them somewhat competitive among growers. One producer acknowledged the small size of markets willing to pay higher prices in Montana saying, “What’s the percentage of people that eat organic? Is it 5, maybe 7%? So out of a million people, how many people is that? That’s not a huge number of people, so that market is not a huge market” (PM17). Another producer illustrated this using a specific buyer as an example, because the store “can only sell so much winter squash or so much garlic or basil...So it can get kind of tense I guess would be the best word” (PM5), referring to relationships between growers. In general, these producers feel there is no more room for increasing sales in Missoula markets.

Two producers who sold directly to Missoula markets before the Co-op, and also feel like Missoula markets are currently filling up, expressed that they plan to continue selling products directly to buyers even if these direct sales compete with the Co-op. One member noted explicitly that direct sales by members is common and that this prohibits the Co-op from taking full advantage of premium markets in Missoula: “They [Co-op] can’t take advantage of the big market right at their feet” (PM6). These competition issues are discussed in more depth in the challenges section, but they should also be taken into consideration when thinking about organizational growth. Such issues can be divisive and potentially detrimental to the long-term success of the Co-op because growth in a values-based supply chain requires more than just the ability to outcompete others in the marketplace.

Some newer growers who sell a large percentage of their produce through the Co-op also feel Missoula markets are small and competitive. One producer believes the Co-op should give priority to new members who contribute a higher percent of their crops to the Co-op when deciding which producers get sales priorities for high-paying Missoula markets: “It would be a good business move for the Co-op to try to pick up a commitment [promise to grow] from a grower who’s more committed [invested] to the Co-op...with this current setup, the local markets are all snagged up” (PM19). Some of the newer producers who believe higher paying markets are being filled are frustrated by other members’ decisions not to give up direct marketing when those sales compete with the Co-op.

Filling in the Gaps Existing in Readily Available Local Markets

While some members believe Missoula markets are saturated, other members feel there is still room for expansion. One producer felt Missoula markets want products that the Co-op could provide:

They [store] have Mexican conventional...I'm just saying that if the Co-op was able to organize growers, like let's make sure that among us there is hot peppers for [store name]...all summer they [store] had no local peppers at all...[store] is a huge untapped resource and can be difficult to work with. I've asked before, what do you not get locally? [Store staff] didn't answer that question (PM17).

Another producer also sees opportunities to grow within Missoula markets: "I feel like there's definitely more of a demand that we could fill" (PM12). Another producer indicated an interest in seeing more Co-op products in institutions, implying that these markets have yet to be filled by local produce which the Co-op could offer: "I'd like to have a greater role in providing food to institutions in five years...more to the University, and more to public schools" (PM5). In contrast with members who feel Missoula markets are full, a few members feel certain areas in these markets could be better utilized which would reduce challenges arising from competition between the Co-op and Co-op members who choose to conduct direct sales.

Market Feedback

One barrier to producer growth noted by a few interviewees is the need for feedback about crop planning and consumer preferences. Such feedback is crucial to improving product quantity and quality in order to increase sales through the Co-op. One interviewee noted specifically that feedback related to quantities determined during crop planning in January has been a challenge to growth: "We have to commit to certain crops and how much, and we'll get feedback...but the feedback is not all that good" (PM2). Another grower felt that the Co-op could play a vital role in sharing customer feedback about product quality, noting, "Cause they [Co-op] are in the markets every day, which is wonderful cause that means I don't have to be there...but the downside is that it's important to know the market trends, the feedback from buyers, consumers, at the ground level cause I'm kind of one step removed from that" (PM15). When a producer sells directly, they have the ability to respond to customers' feedback. This opportunity seems less available for some producers working with the Co-op, creating a potential barrier to increasing sales, both for individual growers and the Co-op as a whole.

Diversifying Types of Products Sold

In addition to increasing the overall number of markets accessed and saturating markets in Missoula, several members feel the Co-op could increase sales by increasing product diversity

and enhancing its infrastructure. Four producers specifically mentioned the benefit of being able to sell meat: “It would be nice if somehow we can figure a way to really incorporate meat...some way to have a steady, solid, bigger supply of meat” (PM17). Another producer agreed and also suggested meat could be sold as a value added product: “Some people wanted to get...a Co-op burger going...[beef] is a trickier thing to sell, but [PM7] thinks it is a problem that can be overcome” (PM3). Among producers who discussed the possibility of increasing meat sales through the Co-op, most felt that the challenges to meat distribution could be overcome such that the Co-op would benefit from increased meat sales.

Aside from suggesting increased meat sales, a few members suggested increasing the number and variety of products the Co-op is able to sell specifically during winter months. One producer commented, “They should focus their energy on expanding their products, the diversity of what they carry so that they can carry more products in the winter and early spring” (PM14). Another producer agreed and noted that storage crops are a potential area for growth, saying, “We’ve talked about trying to put in a Co-op storage facility to have that available for all growers, but so far we haven’t figured out a way to do that, so growers are responsible for their own storage crops” (PM12). Currently, producers bear the weight of keeping storage crops until their sale, but if the Co-op were able to provide storage, some producers feel it would encourage more production of these crops and increase year-round sales for the Co-op.

In addition to meat and long season crops, two producers also discussed processing as a means to diversifying Co-op products. One producer seemed to think the Co-op could be directly responsible for processing items: “I talked to them about it [coleslaw]. That’s something you could do for several more months through the winter. Lake County Community Development has the processing facility, but they want too much money for the use of it” (PM8). Another producer felt that the Co-op should operate as a facilitator for processing but should not be involved directly. They also felt strongly about producers being responsible for seeking out opportunities to process their products, although they did feel that the Co-op should actively encourage this behavior. From the producers’ perspectives, the potential role of the Co-op in the production of value-added products lies in the Co-op’s ability to aggregate and transport products and to actively coordinate production for processing.

Secure, Responsible, Low-Risk Growth

At least eleven of the producers sampled discussed the desire for the Co-op to grow responsibly, securely, and with minimal risk because of the close ties between the success of an individual’s operation and the success of the Co-op. Issues mentioned by these producers included economic viability, infrastructure, and efficiency.

Growing in an Economically Secure Way. Interviewees expressed confidence in the ability of the Co-op to grow responsibly, based on growth and improvement over the last several years, though many still expressed a desire for cautious, slow growth. About half of the producers expressed a need for careful economic consideration when considering the Co-op's potential for growth. One producer discussed this, citing a board decision to raise his membership fee: "Responsible growth has to be economically viable...they raised my dues this last year, but they have a legitimate reason to" (PM8). Another producer addressed the importance of careful economic decisions because of the Co-op's limited financial resources and assets, saying, "We don't have any cushion. We don't have any assets or anything like that. We're always going to have to be sort of a...balancing act" (PM17). While expressing concerns, several producers recognized that the Co-op has improved their financial viability: "I think they've got a better handle on those things, making numbers work, than they did two years ago" (PM 8). Because of tight margins, producers feel the need to grow in a way that will not jeopardize the Co-op and are simultaneously willing to make necessary, personal contributions because of their confidence in the Co-op.

Infrastructure, Logistics and Efficiency. A number of producers mentioned possible efficiency and infrastructure improvements that they believe are necessary for Co-op growth. At least five producers addressed physical infrastructure, referring to the need for warehouse space and functioning trucks: "It seems like...security of our distribution is probably our most important, so making sure that our trucks are reliable" (PM12). In addition to physical infrastructure, producers also stressed the need to improve the pay and time requirements of Co-op staff. One producer explained, "My biggest fear is losing managers, they're really talented. And drivers, we kind of burn through the drivers, because we used to have 16 hour days, which is not the best thing" (PM3). While several producers expressed the desire for improved infrastructure, many observed that it has already improved notably over the last few years. As one producer put it, "we need the infrastructure to be efficient. And I think we're doing a lot better on acquiring that infrastructure" (PM19). Several producers mentioned the challenge of balancing infrastructure improvements with the need to keep costs low. As one producer stated, "the more we sell, the more our expenses go up too, because we have more labor costs and more fuel costs...so far it hasn't happened where we've got that extra capital to invest" (PM5). For members, the viability of growth, especially secure growth, seems to be associated with steady, cost-effective improvements to infrastructure, and with good working conditions for the staff.

Aside from increasing the efficiency of Co-op operations, some producers noted the importance of economies of scale and partnerships for growth. One producer said the following about economies of scale: "[It] is not just an abstract concept, it's a reality. Especially when you're travelling distances and especially when you're dealing with relatively low value products per

pound, that economy of scale comes into play in a very positive way” (PM15). This producer suggests that one of the simplest ways to decrease the cost paid by the Co-op for each item they sell is to sell more items at a time with existing infrastructure. Along these same lines, one producer felt there was an opportunity for the Co-op to partner further with a processing facility and noted, “It might be nice to have a processing center that would buy stuff and process it. We don’t really have something like that around here. There’s Mission Mountain, but you have to process it yourself” (PM19). Another producer believes there are additional partnership opportunities between the Co-op and other organizations in Western Montana and offered transportation as an example: “there’s two ways to grow; you have your own trucks...and you grow that way, or you partner with another distributor in Billings to carry...the Co-op products” (PM11). Producers believe economics of scale and partnerships similar to the current partnership with Charlie’s would enhance Co-op distribution without necessarily additional infrastructure investments.

Increasing the Number of Producer Members

When making decisions about taking on new members, it is necessary to determine gaps in Co-op products that could be filled by new farmers. In general, four members felt there should be additional growers. One described their vision for the Co-op in five years saying, “Have lots of growers. I think there are a lot of growers that want to grow, they don’t” (PM4). Other members expressed ambivalence about additional producers who would potentially increase competition among growers in and outside of the Co-op: “New farmers...I don’t know. Sometimes I think that if too many people are growing the same thing, there’s going to be too much” (PM18). One producer suggested the need for additional producers depended upon the crop, saying, “With herbs, no problem, it depends on the crop, but some crops we [producer] are maxed, tomatoes, we’re maxed out” (PM16). For crops that have a large market, it may be prudent to incorporate additional producers when current producers cannot or will not increase their production of that crop. This kind of close, crop-by-crop consideration is necessary when making decisions about growth.

Growth at the Individual Level: Willingness to Increase or Change Production

In addition to sharing their thoughts on overall Co-op growth, producers also discussed their willingness and ability to increase production on their farms. Five producers (8, 11, 13, 4, and 5) all discussed their plans to increase production under the assumption that the Co-op would be able to sell their additional products. For these producers, sales through the Co-op have either steadily increased to the point where the member feels comfortable increasing production, or the member assumes they can increase production because they offer a product that does not currently seem to have limited markets. Although some producers mentioned future projections in planning with the Co-op, most did not seem to include projections in their

decision making process. Instead, decisions to expand production seemed to be based on the producers' understanding of past years' sales with the Co-op or decisions were based on member's dedication to the Co-op regardless of sales.

For many producers, willingness to change their production depends on the crop. According to one grower, if they knew the Co-op "wanted something that really sells well, I would be willing to increase production" (PM18). Another grower also mentioned they might change their production to crops that the Co-op has in lower quantities: "last year I switched to crops they didn't have, broccoli and cauliflower, and they sold everything I had. I didn't increase production on a producer scale, but I changed my production for the Co-op" (PM17). Guaranteed supply and sales are not the norm in agriculture, but careful evaluation of potential sales on a crop-by-crop basis makes decisions easier for producers who are willing to expand or change their production.

Other members would not be willing or would be unable to increase production for various reasons. Several producers are limited by regulations outside of the Co-op. For one producer, USDA poultry certifications restrict the size of their operation (PM14). Another meat producer felt they could not increase production because their farm is not certified: "They [Co-op] told me that if I did certify, I would have more likelihood of selling...from my point of view, I usually don't blame the Co-op because I'm the one that's not certified organic" (PM3). This producer finds the organic certification difficult to obtain, which makes it difficult to increase sales through the Co-op. One fruit producer stated explicitly that they would not be willing to change their production practices based on the Co-op's needs even if this decision increased competition between their operation and the Co-op's: "Missoula is an easily accessible market right now, the Co-op hardly sells anything in Missoula...all of the members, including myself, we sell directly in Missoula because we can get more money that way by bypassing the market of the Co-op" (PM 6). Members who have established markets in Missoula and other locations that are easily accessible are less willing to change their practices to benefit the Co-op.

Recommendations:

- To grow securely, the Co-op should increase sales volume (market demand can be increased by raising the number of markets accessed or more effectively saturating markets, and by providing more desirable products to those markets by providing market feedback to producers) while refraining from increasing investment in added staff members or physical infrastructure.
- When producers do not obtain certifications, which could help increase their sales through the Co-op, the following solutions are available:
 - The Co-op could facilitate producers' adaptation to the regulations.

- Emphasis could be placed on marketing in order to promote members' products as they are
- With regard to incorporating new producers, the Co-op should decide the extent of its role as a facilitator for new producers: Does the Co-op primarily see its role as a distributor of local food and thus a service for all producers of local food, or does the Co-op see its primary role as a service to current producers?

The Co-op should take on new producers if the producers can function easily within the current infrastructure (ex. can they deliver their own produce to drop points). Taking on these new members is a way to increase volume in order to create better economies of scale, which will provide more revenue without increasing costs.

The Role of the WMGC in the Regional Food System

This report has included producer reflections on benefits of Co-op membership, challenges associated with membership, and member engagement and commitment. Gaining a better understanding of what growers understand the Co-op's function in the regional food economy to be provides insight into grower perceptions of what the Co-op is currently doing well and what they *should* be doing well. The WMGC was initially begun as part of a network of community organizations and partners dedicated to local food system vitality. In order to identify whether the WMGC is meeting its mission and organizational goals, it can be useful to hear from members and partners what their understanding of the role of the WMGC is in our regional food system.

Each of the Co-op's producer members interviewed for this study described what they understand the role of the Western Montana Growers Cooperative (WMGC) to be in the regional food economy. Posing this question to them got at a central aim of our research, providing the interviewees with an opportunity to reflect upon the mission of the Co-op after they had already shared with us the services and benefits their own operations receive from Co-op membership. Overall, participants' understanding of the role of the WMGC aligned closely with their description of Co-op benefits, including the Co-op's function as a key aggregating, marketing, and distribution agent in our food system. Many participants also reflected on how the Co-op's role includes supporting the popularity of local food, supporting small-scale farmers, and, more generally, to support a changing food system by offering critical improvements to transportation and access. This suggests that, in addition to performing these three central functions in the regional food system, the WMGC has had a broader impact, leading members to see the Co-op's "role" as including more than just marketing, aggregation, and distribution.

Aggregator, Distributor, Marketer

With the exception of only two interviewees, all participants clearly identified the WMGC's role in the regional food system as including three functional dimensions: local food aggregator, distributor, and marketer. Each member highlighted one of these three roles as important to their relationship with the Co-op depending in part upon the size and geographic location of their operation. For example, producers located in more geographically remote locations emphasized the importance of the WMGC as the *transporter* of quality local products. One producer for whom this was of particular importance noted that the WMGC goes:

all over western Montana, you know, all the way over to Billings and up to Whitefish and down in the Bitterroot...Because of the remoteness of our farm, there's just no way we could do that. And there's really no local restaurants or grocery stores around us that we could make a living supplying anyway...Our business totally relies on the success of the Co-op (PM 5).

By contrast, growers who operate smaller farms or who prefer to grow a greater variety of items in smaller quantities tended to focus on the role of the WMGC's role as *aggregator* of products such that these products can then be marketed to businesses and institutions that would otherwise be uninterested in purchasing produce in smaller quantities. One producer who described this relationship reflected that:

The Co-op is good in a way because it can get you out to the stores where we wouldn't be able to get into the stores. They wouldn't want to buy from you when they can buy it from Sysco or from other people that are a lot bigger. For the little grower it's a good thing (PM13).

Finally, some members who have particularly benefitted from the WMGC's outreach to new stores, institutions, and other markets (PM 4 and 8) emphasized the importance of the WMGC's role in marketing quality local products to diverse markets in western Montana. One producer commented that the WMGC has established relationships with small rural stores in parts of the region that had previously not been accessible to his farm or that had not been interested in purchasing local produce. Our data clearly indicates that grower members understand the central role of the WMGC to be that of aggregator, marketer, and distributor of local produce, but their focus on one particular function seems to depend on the type and size of the operation and the geographical location of the farm. This suggests that when the Co-op wants to convey the benefits of membership to existing and potential members, they may want to emphasize the functions that are most relevant to the audience in question.

Improving the Viability of Small and New Growers

By successfully filling the role of aggregator, marketer, and distributor of local, and often organic or “sustainably-produced” products, the WMGC has also helped small and/or beginning farms across western Montana grow. In order to build and maintain the financial viability of their farms, small and beginning farms require market access and opportunities to establish new market relationships as their businesses grow. Five growers noted that this has been a major part of the work of the WMGC in the regional food system. One farmer couple explained:

I just know that, for us, we’re pretty new farmers and...our sales to the Co-op are the place where we can continue to grow...the bulk of our income and our increase in income come from increased sales through the Co-op...It has pushed us or allowed us to become producers of larger quantities of fewer items, which I think is more efficient and I think it’s easier to do and I think it will allow us to keep doing this longer. I think it’s a more sustainable approach (PM19).

For these farmers, the WMGC has not only increased the market for their produce, it has also influenced their production planning. Another farmer explained that the Co-op provides “encouragement for new farmers to get started because...it’s a major help for people who are new to doing this and who don’t have long-established contacts with outlets.” This grower also felt that Co-op membership provides additional “clarity and direction” for new growers and could even help them establish “higher standards of crop production” (PM16). In addition to offering outreach to and new markets for *beginning* farmers, participants reflected that the WMGC is also critical for existing small farms because of the services they provide. One farmer noted that, prior to the WMGC, “the distribution and the marketing were lacking, and the production, the farmers were here, but there was no established market, no kind of guarantee, semi-guaranteed market for when you were planting” (PM16). In this way, the WMGC’s role has been to support small farmers in western Montana who might otherwise be unable to sell and distribute their produce as effectively as they can with the Co-op’s assistance. These responses suggest that through their role as distributor and marketer of local produce, the WMGC has supported new *and* existing farmers in their efforts to establish viable farm businesses, thereby increasing the number of farms in western Montana and, in turn, the quantity of local produce.

Increasing Access to Local Food

Looking at the role of the WMGC from a broader perspective, several interviewees commented that the Co-op has played a crucial role in increasing access to local food in rural communities and, to some extent, lower income groups. In other words, by virtue of their role as distributor

of local goods, the WMGC is playing a role in the expansion of an alternative food economy. One producer noted that this has seemed particularly important for the communities in the central part of the state that are served by the WMGC (PM6). Another grower expressed appreciation that communities north of Missoula have increased access to healthy, fresh foods because of the Co-op, while other members noted the importance of aggregation (and thus of the WMGC) in getting local food to geographically more remote locations for efficiency reasons (PM17, 13). In addition to their ability to reach more remote areas, the WMGC is also supporting an alternative food system through its work with institutional buyers, including hospitals, universities, and schools. Their role in building farm-to-institution programs is a critical step in expanding the breadth of a local foods movement and an alternative food system, but also has meaning for producer members, who recognize that they may not otherwise be participants in such programs without the involvement of the WMGC. One grower noted that:

We used to try selling, for instance, to St. Patrick's and...the guy after a few deliveries showed me this list that he gets from Food Service of America and he says, 'we want this, we make an 'x,' we want this quantity, we make an 'x' here, and we put this together, we fax it in, and we get it next week'...It was clear enough, I take up his time, I deliver twenty pounds of onions, and in that span of time, he could have made his whole food order for St. Pat's (PM16).

Because of their involvement in these programs, the WMGC is both an active participant in our local foods movement as well as the "glue" that connects individual farms and farmers to broader community efforts to build a new system. Specifically, the WMGC plays a key role in accessing wholesale markets that want and need to work with one marketing and distribution entity rather than with multiple small producers.

Transparency and Accountability

A key impact of the WMGC appears to be the increasing transparency and accountability present in our regional food system. Specifically, one of the producers interviewed felt that this was a particularly important role being filled by the Co-op because our dominant food system seems to discourage consumer awareness of food origins and production practices (PM14). Another producer offered similar thoughts and feels that the WMGC is (and will continue to become):

the premier distributor of local, quality product...That they can explain to the consumer that they are friends with the consumer, that they are not the enemy, that they are not trying to sell them a product that isn't a quality product, that they are protecting the consumer by doing nothing but selling and servicing

them with quality farmers that care about what they grow...and a healthier product (PM11).

The perception that the Co-op is enhancing transparency and accountability within our regional food system stems from the connections between producers and staff, as well as from the perception that staff communicate frequently and thoroughly with buyers.

The “Face” of Local Food

Many participants expressed the belief that the WMGC plays a critical role in the rebuilding of a more viable, sustainable food system. One producer commented that “...our mission is to participate in and help support a more sustainable food system and WMGC is a model for how that can be done” (PM15). Another member explained his thoughts on the WMGC’s role being:

critically important if we’re looking at establishing a viable and sustainable food system within the state or within the Co-op’s particular piece of the state, because in addition to providing food, they’re also providing the advocacy for a sustainable food system. I would say it’s critically important (PM16).

Besides aggregating products which are then marketed and distributed, a couple of producer members feel the WMGC plays a central role in the “bigger picture,” meaning that their work is about more than simply improving the viability of small farms in western Montana. For instance, one farmer noted that the Co-op “aggregates us,” meaning the producers, and connects them to each other and to the broader scope of the alternative food system work being done in our region of Montana (PM19). By bringing together like-minded farmers and identifying buyers who value quality local produce, the WMGC is acting as a key structure within the alternative food system they are hoping to build.

Because the Co-op has been effective at marketing and distributing local products around western Montana, a number of growers reflected that an additional function of the WMGC is to “represent” local food and agriculture through its business operations. One grower explained that, “part of the reason the Co-op exists is to promote local agriculture” (PM6). Another grower expressed his belief that stores and institutions around Montana “look to the Co-op for quality local produce” as the demand for “local” increases in popularity (PM14). In other words, producers recognize that the WMGC serves to promote and advocate for local agriculture by focusing its marketing and aggregation services on specifically local, and oftentimes organic or “sustainably-grown,” products. By serving as an advocate for local products and agriculture and by supporting the viability of small and/or new farms around Montana, the WMGC fills a vital niche in our regional, values-based food economy. In his interview, one grower noted the

unique role WMGC plays in the food system and that they take a different approach than other businesses with similar functions:

Their basic role is to provide that distribution that otherwise would not exist and sort of beyond that, provide it as a kind of a mission and service-driven enterprise versus a profit-driven enterprise (PM15).

Their use of the cooperative business model, combined with their focus on supporting small, local farms and working with institutions to increase the volume of local purchasing, means that the WMGC embodies a set of values that is shared by its membership. These values are expressed by its membership as being focused on a healthier, more sustainable agriculture, a more transparent food system, and smaller farm operations.

Conclusions

- Products sold by multiple members while representing a small portion of sales (such as vegetables) may indicate potential areas of conflict for grower commitments. Low sales item may indicate areas for growth and increased member participation (such as beef and pork).
- Primary member benefits are: the distribution and aggregation of goods; empathetic relationships with other members; working with committed staff; financial return; and belief in local products.
- Primary member challenges are: inaccurate sales projections; competition between growers over commitments; competition between members and the Co-op for the same market; short turnaround from sales to pick-up; and the sales margin.
- Overall member participation in the Co-op is divided – some members are deeply involved and invested while others remain on the fringes.
- Members think the Co-op is fulfilling its role in the local food system by being an aggregation and distribution hub, increasing access to local foods, improving the viability of small and beginning farmers, and being “the face” of local food in the region.

PART III: MARKETS OF THE WMGC

Kim Gilchrist, Arza Hammond, Morgen Hartford, Katie LeBlanc,
Rachel Mockler, and Stephanie Parker

Overview

This part of the report explores the market outlook for the Co-op, including customer and staff perspectives and market considerations. We targeted three specific areas that the staff and Board of Directors of the WMGC desired to have more information about– the growing Community Supported Agriculture (CSA) program, the strong health food store customer base, and the potential growth opportunity of institutional buyers. We first review our research methods, followed by a discussion of perspectives from each of the above-mentioned target areas. Each market section explores customer satisfaction with ordering and delivery, perceptions of product quality and variety, marketing, benefits, challenges, and market considerations for the Co-op. We conclude with an overview of the role of the WMGC in our regional food system from a customer perspective and conclusions from this part of the report.

A 2007 case study of the WMGC interviewed wholesale buyers, and in this study, Neeley (2007)¹ concluded:

The Western Montana Growers Cooperative helps its wholesale customers overcome many challenges of purchasing local food by providing: high quality products; access to a wide variety of items from many growers; a convenient process of ordering, delivery, and payment; a professional business strategy in-line with industry standards; and somewhat reasonable prices. Despite many positive aspects of buying from the Co-op, however, participants also suggested several areas in which the Co-op could better meet their needs, including: increasing supply; promoting stronger connections between Co-op members, wholesale customers, and end consumers; doing more planning in the off-season; delivering directly to all customers; doing more promotion; and, in some cases, the high prices of Co-op products.

Since that study, the WMGC has experienced a substantial increase in sales across all product sectors, with total sales increasing 254% over the past six years. This growth reflects expanded inventory categories as well as a broadening of the types of customers served by the WMGC.

¹ Neeley, B.A. (2007). *Building a Better Local Food System: A Case Study of the Western Montana Growers Cooperative*. (Graduate Thesis). University of Montana, Missoula, Montana.

The distribution of sales by wholesale customer type in 2011 can be seen in Chart 1 (data does not include CSA sales).

Chart 1. WMGC Sales by Customer Type, 2011.

Health food stores generate a significant majority of WMGC sales, compared to a minor percentage of sales generated from institutional customers. With the Co-op being so disproportionately represented in different markets it's a strategic time to study their current standing in the marketplace.

Methods

To conduct our study of the WMGC markets, we used two primary data collection methods: mail-in surveys and phone interviews. We also interviewed staff and partners for their views on the CSA program (see Appendices F & G for survey tool, tabulations, and interview guide).

CSA Survey

The WMGC CSA program has experienced a lot of growth since its inception, and more expansion is planned for the coming seasons that will require increasing commitment from WMGC staff. In interviews of staff and Co-op partners we asked questions about the CSA to gain an insider perspective of the program. All opinions discussed in the Perspectives on CSA section are based on in-depth interviews with staff and key partners.

Mail-in surveys were used to gather information and opinions of individual CSA members which aimed to understand demographic characteristics of the members, important factors in choosing to be a member, and overall member experiences.

Data Collection and Analysis. Demographic questions asked about pickup location, length of CSA membership, age, gender, and education level. To gauge important factors of choosing to be a CSA member a series of statements were written in which the respondent may choose varying levels of importance, including “Very Important”, “Somewhat Important”, “Not Important”, or “Don’t Know.” To evaluate member experiences with the CSA a series of statements were written in which the respondent may choose how true they feel the variable statement is, including, “Very True”, “Somewhat True”, “Not True”, or “Don’t Know.” These survey questions and their corresponding responses are shown in Appendix F.

To reach a deeper level of understanding from the CSA members, the final portion of the survey asked open-ended questions. This was to get a range of items the members would like to see more or less of in terms of produce; whether the CSA share met their weekly produce needs; and an explanation of why they do or do not intend to continue being a CSA member.

The aim of the research team was to get as many of the 151 current CSA members as possible to respond to the survey. Team members were stationed at the four largest pick-up locations in the Missoula area to distribute surveys and collect them once completed. A postage-paid, self-addressed envelope was given to respondents who were unable to complete the survey on-site. These locations included: St. Patrick Hospital, the Trailhead, and two areas near the University of Montana. For all other pick-up locations surveys were distributed into each member’s share box on the last delivery date of the 2012 season with a postage-paid, self-addressed envelope attached for return. Of the 151 CSA members, 112 members responded to the distributed surveys, a 74% response rate.

The survey collected data from summer CSA program participants only. Using statistical software (SPSS) for analysis, cross tabulations were analyzed to determine significance at the .05 level according to Chi-Square tests.

Limitations of the CSA Study. Our strong response rate made the surveys an integral tool in the collection of information about the CSA members. There were, however, errors in the survey design. One question used to determine the characteristics of the sample, in this case family size, asked participants to check a box with a range of household sizes in increments of two, i.e. the CSA fed 1-2 people, 3-4 people, etc. There was a repeated number in the range 5-6 people

and 6-7 people, which may have distorted the demographic characteristics of the sample. One question appeared twice on the survey, but many respondents caught this error and did not answer the question. Another question assumed that all respondents had children: “The vegetables I feed my children are healthy,” which led some respondents to write in “N/A” or “Does not have children” beside the question. There was also a double-barreled question that asked: “Did the quantity of the produce meet your weekly produce needs? Or did you need to visit a grocery store for supplemental items?” Lastly, a set of questions asked members if they wanted more information on the following topics: 1) The farmers who grow for the CSA 2) The Western Montana Growers Cooperative or 3) Other local food issues, such as (with a blank for respondents to fill in particular food issues). Each question had a box to check if they wanted more information. We could not assume an unchecked box equated to a respondent not wanting to know about a certain topic. Therefore, these questions were not used in analysis.

Wholesale Buyer Methods

To study the WMGC’s wholesale buyers, we conducted phone interviews with a selection of current WMGC customers. To determine the potential participants, we identified a purposive sample, focusing on two types of buyers: health food stores and institutions. We focused solely on these two types (and thus left out grocers, restaurants and others) because they currently represent the Co-op’s largest market and an area for potential growth, respectively.

Health Food Store Sample. Health food stores comprise the largest sales category for the WMGC (47% of total sales) and represent the Co-op’s largest market. In general, individual health food stores also buy more WMGC products than individual restaurants or grocery stores, and therefore seem to have a more established relationship with the Co-op. Looking to draw on the knowledge these particular customers have about the Co-op, we interviewed those stores that purchased at least \$4000 worth of goods from the WMGC so far this year (as of September 2012). Because these stores regularly conduct business with the Co-op, we anticipated they were most likely to provide us with the best opportunity to gain insight into the WMGC’s role in our local food system.

Our proposed interview sample consisted of 10 different health food stores (out of a total of 24 current health food store customers of the Co-op) with a total of 12 different interviewees. We chose to interview two people in some stores because of their size and the fact that different departments work with the WMGC (e.g., some stores have separate produce, deli, and dairy departments which order products independently). Two people did not respond to our request for interviews, so our sample consisted of 9 different health food stores, with 11 total interviews, a response rate of 92%.

Institution Sample. Institutions are an emerging customer base that presents a lot of growth potential for the WMGC. As this is an opportunity the Co-op is interested in pursuing, our research team felt it was important to learn from these customers as well. WMGC had six institutional customers in 2012, however one of those customers was new. From the 2012 customers, we chose to interview the five institutions that were also customers in 2011 and therefore had at least a one-year relationship with the Co-op. We were unable to schedule an interview with one of these institutions, so our institution sample consists of four interviews, a response rate of 80%.

Data Collection and Analysis. We conducted individual phone interviews with our two institution types and on average these lasted about 30 minutes. Each interviewee was asked the same questions; some were closed-form and others were open-ended questions. We analyzed the close-formed questions for high frequencies to determine themes or trends. We then analyzed the open-ended questions by reviewing transcripts of each phone interview and identifying recurring themes regarding topics of particular interest.

Strengths and Limitations of Methods. We chose to conduct phone interviews rather than face-to-face interviews so we had the opportunity to talk with customers from all of the areas of Montana. Otherwise, we would have been limited by time and funding in traveling considerable distances to areas such as Billings and Bozeman. As a result of the phone interviews, we were able to capture the perspectives of a broader range of customers, giving us a more holistic view of how the Co-op functions as a food distributor in our region. Our phone interviews were also more in-depth than a self-administered survey would have been because we were able to probe during interviews to gain the level of detail needed to conduct a thorough analysis.

Furthermore, conducting phone interviews gave us the ability to reach a larger portion of the WMGC customer base. We were also able to interview buyers from different sales tiers, so we heard the viewpoints of large, mid-level, and smaller buyers. By interviewing institutional buyers, including some with smaller sales, we were also able to gain perspective in this area of potential growth for the Co-op. Again, speaking with a broader range of buyers gives us a better picture of their perspectives on working with the WMGC.

Our study is not without its limitations. Although we were able to get more in-depth in our phone interview than with a self-administered survey, we were not able to get the level of depth that would come from a face-to-face interview. We interviewed people far away who have busy schedules, so participation in our study could not take up too much of their time. As a result, there will likely be some details missing that we were unable to explore in more depth

(as one would in a face-to-face interview). Also, we had five different students conducting the interviews, so the level of depth may be greater from some interviews than others.

As previously mentioned, we chose to interview more than one person from a few stores. Although we feel this ultimately gives us a clearer picture of that store's relationship with the WMGC, it does mean that the perspective of some customers may be over-represented in the findings. In addition, once one interview in particular was underway it became apparent that many of our interview questions were not applicable due to the type of relationship this customer has with the Co-op; however, this customer has a deep knowledge of the WMGC and is an important customer so we still decided to include this information in our data.

Perspectives on Community Supported Agriculture (CSA)

A CSA is a means for consumers to buy local, fresh food direct from farmers. It has grown in popularity since it began in the Northeastern US during the 1980s. The way a basic CSA works is that the consumers, or shareholders, make a down payment at the beginning of the growing season and in exchange get a box of produce, sometimes including dairy or meat products as well, usually once a week. The items in this box are chosen by the farmer and the amount may fluctuate week to week depending on what they are able to harvest. The farmer gets advanced capital and the shareholder is able to invest in a farm and access fresh and local produce.

Background of the WMGC CSA

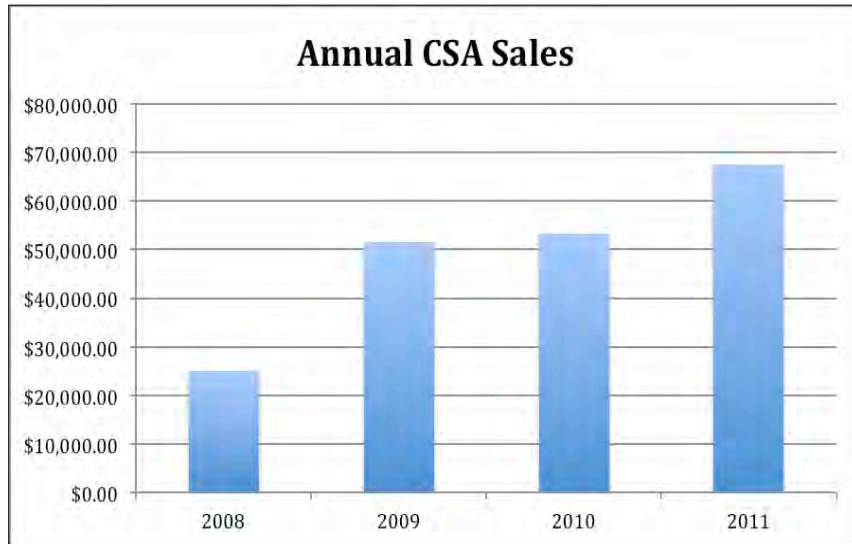

Although the WMGC was founded in 2003, it was not until 2008 that the Co-op established a CSA. WMGC's CSA is a little different than a typical single farm program, in that it is an aggregated CSA. Instead of CSA members buying shares in one farm, they buy shares in the WMGC CSA, which sources from eight to ten grower members.

CSA members may choose between two share sizes, a large share, which costs \$550, or a small share, which is approximately two-thirds the size of a full share and costs \$365. Members are not required to pay for the entire share upon signing up for the program. There is a deposit required, but there are payment plans for those who do not want to pay for the entire share all at once. Supplemental Nutrition Assistance Program (SNAP) benefits are also accepted as a form of payment.

The summer CSA runs from June through October and has nine drop-off points once a week in Missoula, Arlee, Dixon and Helena among other places. The fall CSA has three deliveries with storage crops and costs \$230 total.

WMGC CSA Sales and Shareholders. The WMGC CSA program started with fewer than 30 shareholders and sales of roughly \$25,000. In its second year, both its membership and sales nearly doubled. By 2011, CSA sales accounted for roughly 9% of the WMGC’s total sales and membership grew to 151 shareholders in 2012. Annual sales of the CSA are shown in Chart 2.

Chart 2. Change in Annual CSA Sales, 2008 – 2011.

The WMGC secured a Farmers Market Promotion grant this year that was based on a plan for growth, so the staff and partners are looking forward to a future with a larger CSA program. The grant proposal stipulated “that we wanted to double our membership within two years, so be at 300 people within two years for the summer share,” said S6. P3 believed that CSA growth is a no-brainer. “And then targeting like the CSA which is barely tapped. I mean one producer can do 150 CSA shares. One producer up in Eureka does. They should be at 1000. So how do they get there?”

Staff and partner perspectives on the CSA program

The following section discusses the opinions of WMGC staff and partners about the CSA. All the benefits and areas for improvement highlighted here are based on interviews with staff and partners and do not take into account the opinions of the growers or CSA members. The next section will discuss member opinions of the CSA based on surveys.

Benefits for the WMGC and Growers. The growers of the WMGC benefit from the CSA program in a number of ways. Prices for certain items sold through the CSA, like herbs and green beans,

are higher than the items they sell retail. In addition, growers do not have to worry as much about excess produce during the CSA season because they can fill the boxes with whatever produce they have. This serves to both reduce food waste and help the growers bottom line. There are no requirements to have a certain number of any one thing in each box, although consumers do have preferences.

The CSA also provides cash flow for the growing season. It requires payment early in the year so the growers receive an investment for necessities like seeds and equipment. “And the CSA, like other CSAs, gives them a down payment at the beginning of the year for their operational costs,” said Co-op partner P3.

The CSA also markets and sells for the growers, taking that labor and time commitment away. “So there is a huge cost-benefit because we do all the marketing for the growers, so that it kind of takes away a lot of extra work they would have to do. It just kind of adds another market for them,” said S6. It is also a powerful marketing tool for the WMGC. While a shopper at the Good Food Store, for example, may not realize where their produce comes from, CSA consumers are much closer to the producers of their food and communicate directly with the Cooperative itself.

Benefits for Consumers. One of the primary benefits that Co-op staff saw for consumers was freshness. ““They are getting fresher produce than they would normally get at market or the stores because we pack on Wednesday and everything is delivered on Thursday,” said S6. The produce being packed on Wednesday is usually picked Tuesday or even Wednesday morning.

The drop-offs are also meant to be convenient for consumers. For example, employees at St. Patrick’s Hospital can pick up their CSA boxes anytime between 2:00pm until 6:00pm at the hospital cafeteria. This offers them the convenience of picking up produce where they work. In addition, the employees are able to have the cost of the CSA split up and deducted from their paychecks during the season instead of paying at once.

Additionally in a time where much of our food is shipped to us from across the country and around the world, WMGC’s CSA allows buyers to know where their food comes from. Even though the members do not know exactly which farmer grew their produce, they still know about the WMGC and what it stands for and therefore know that they are getting a fresh and local product that supports Montana growers.

The CSA also offers competitive prices for produce and offers the convenience of additional online ordering for items like meat, cheese and eggs. These goods typically cost about 25% less

through the CSA than they do through retail channels. S6 elaborated, “it is not just vegetables they are getting, they can kind of custom order what they want and I don’t know of any other CSA that does that...If you are buying that stuff every week anyways, why wouldn’t you just buy through the CSA, it is cheaper for you.”

Areas for Improvement for WMGC and Growers. The Co-op staff also highlighted some areas where they believe that the CSA could improve. One was that the CSA boxes often take a lot of work to pack and organize. Additionally, while some growers make the CSA their first priority for their best produce, others use it as an outlet for their excess. “What I would like to change, I would like the growers who grow for the CSA to grow first for the CSA and then their other commitments are second to that. That is how the CSA was originally started, the growers who did it, that was their primary market and whatever they didn’t sell to the CSA they sold wholesale or they had market commitments or whatever,” said S6.

There is also some competition over who grows for the Co-op and what they grow. Not everyone can grow whatever they want and certain growers, usually the ones who have been there longer, get first choice. This issue isn’t just specific to the CSA. Competition over commitments is also discussed in other sections of this report as an issue at the WMGC.

Another challenge is consumer perception. While the CSA is always looking for more members, it can be challenging to have shareholders who do not understand the how a CSA works. Some people like the idea of eating seasonally from a CSA but do not recognize the limitations that it can bring. “That has been a dilemma because last season we tried to really market on saying that we are selling produce that is cheaper and fresher than what you would buy at the market, and that was our marketing push. But I think when we did that we got some customers who were just looking for cheaper produce and didn’t understand the CSA model,” said S6. Additionally, according to S6, the boxes at the beginning of this past season were practically empty due to weather, and confused customers thought that they were supposed to be getting roughly \$17.00 of produce per week. Additionally, when they went to the farmers market, they saw produce, sometimes from WMGC farmers, that was readily available to be purchased but had not yet appeared in their boxes. “Because when we have 153 members, like for a grower to sell the first week of market and they have 3-5 heads of bok choy...that is not enough to source our CSA but they can still sell it to market. So our members will go to market, see our growers with things that we don’t have in the boxes yet and want to know why they are not getting it in their box yet. So...how do we sort of bridge that to make sure our growers are contributing to the CSA the same things that the public is seeing?” Bridging the gap between public expectation and the reality of what a CSA is without dissuading potential customers is a challenge that Co-op staff is working to overcome.

CSA Member Perspectives on the CSA Program

The survey used in this study collected data from summer CSA program participants only and aimed to determine demographic information of the CSA members, discover the most important factors to members for choosing to be part of a CSA, and to evaluate member experiences with the WMGC CSA. Below we provide an overview of findings from the survey; complete survey responses can be found in Appendix F.

Demographics. Demographic information helps the WMGC understand who their current CSA membership is and also target markets for future years. Respondents came from nine drop points ranging in location from the Bitterroot Valley up north to Polson and east to Helena. Women were the majority of respondents (83%, n=88) and ranged in age from 20 years old to 79 years old, with 41% (n=43) falling between ages 30-39. The respondent population was also highly educated, with 48% (n=52) having a college degree and 42% (n=46) having attained at least a graduate degree. The majority of respondents (67%, n=73) have only been CSA members for one year and fed either 1-2 or 3-4 people with their share

Most Important Factors for Choosing a CSA. Several questions were designed to determine factors and benefits CSA members found to be important when choosing to become shareholders. The most important factors for CSA members fall into several categories: taste, freshness, local and sustainable agriculture, and health. Table 1 shows the statements that CSA members found to be most true and their corresponding percentages:

Table 1. Statements CSA Members Described as “Most True” Regarding Decision to Become or Remain a Shareholder. (n=112)

Category	Statement	Percent of Respondents
<i>Freshness</i>	The vegetables are extremely fresh	93.7%
<i>Local Agriculture</i>	I am supporting local farming	91.9%
<i>Taste</i>	The vegetables taste so good.	89.2%
<i>Health</i>	I am doing something that is good for my health.	88.3%
<i>Sustainable Agriculture</i>	I am contributing to environmentally friendly agriculture	86.5%

Shareholders’ Experiences with the WMGC CSA. The survey gauged CSA member experiences through general questions about the CSA, about drop point convenience, and about the

respondent’s likelihood of joining the following year. Respondents cited customer service, convenience and value, and trust as the most important experiences as CSA members. Table 2 shows the statements that CSA members found to be most true and their corresponding percentages:

Table 2: Statements CSA Members Described as “Most True” Regarding Member Experience as a Shareholder. (n=112)

Category	Statement	Percent of Respondents
<i>Value</i>	Season length is appropriate.	91.9%
<i>Customer Service</i>	CSA Coordinator responsive to concerns and questions.	87.7%
<i>Convenience</i>	The drop point was convenient for me.	82.7%
<i>Trust</i>	I feel a sense of trust in the Co-op and the food I get from it.	82.7%

Drop Point Convenience. The WMGC aims to make drop points convenient for its CSA members. The survey asked respondents to determine the statement, “My drop point is convenient,” as “very true,” “somewhat true,” or “not true.” The majority of respondents (82.7%) answered that this statement was very true. In statistical analysis, a strong significance (Chi square test – R = .000) was found between a specific drop point and drop point convenience. Of the 19 respondents that determined the drop point convenience statement to be somewhat or not true, 10 of those respondents came from a single drop point (Helena).

Future Plans. A strong statistical significance (.000) was also found between responses as to whether or not the CSA program was a good value and whether or not the respondent will be a CSA member next year. Respondents choosing “somewhat true” or “very true” when asked if the CSA program is a good value also frequently responded that they would be CSA members next year. Additionally, statistical frequency output was used to determine the reasons for or against continued CSA membership. 93.6% of respondents said they would like to be CSA members next year compared to 6.4% of those who would decline membership. Respondents had the option to say why they would or would not choose to be a CSA member next year and 42% chose to respond.

The reasons for continued CSA membership with the greatest frequency were:

- 1) Supporting local food and/or the local economy
- 2) Good value
- 3) Quality and/or freshness of the food

4) Overall good experience

Those who have decided against CSA membership next year, listed the following as a reason for not doing so:

- 1) Preference for farmer's market
- 2) Presence of a personal garden
- 3) The drop point was inconvenient

There were more respondents that were unsure as to whether or not they would continue to be members next year compared to those who decided against continued membership. Some of these undecided respondents noted that their membership might be contingent on the following factors:

- 1) Decrease in membership price
- 2) Establishment of personal garden
- 3) Difference in quantity and variety of produce

Market Considerations

Staff perceptions of the consumer benefits of the CSA were right in line with what survey respondents said. Freshness, convenience, and the locality of produce are important factors for CSA members both in choosing to participate in the program and in valuing their membership. 93.6% of respondents reported that they would like to be CSA members next year, clearly indicating that respondents were overall very satisfied with the program. This high customer satisfaction coupled with the awarded grant money present many opportunities for growth for the WMGC CSA program.

In order for the growing CSA to be a continued success additional infrastructure and commitments will be necessary to accommodate the increasing demand. Staff cited concerns about member commitment to growing for the CSA, staff preparation time, and consumer misperception. The WMGC may consider increasing the amount of delivery days per week to spread out the packing time and recruiting more farmers to participate in the CSA. These are all areas that will need extra thought and planning to accommodate a larger CSA.

Although staff felt an obstacle for the CSA might be that the consumers do not get to know a specific farmer's produce, survey results did not support this. It was a top priority for the respondents to feel they were contributing to a local and sustainable food system, but they were less passionate about knowing the farmers themselves. Over 85% of respondents said supporting local farming and contributing to environmentally friendly agriculture were very

important to them, compared to 43% who said that knowing the people who grow the vegetables they eat is very important. Although improving farmer identity may not be a high priority improvement for the CSA, it still presents opportunities. Farmers that wish to have more of a presence and brand with CSA members can host farm tours or farmer meet-and-greets. These opportunities may help build loyalty from those members who do wish to know individual farmers.

Some other things to consider as the CSA gets ready for future seasons may be:

- Advertise the options of using alternative payment plans or SNAP benefits to pay for CSA shares. One of the reasons some respondents cited against continued membership is the cost of membership and more knowledge of different payment methods may encourage continued or new membership for those who feel they cannot afford to participate in a CSA.
- Provide an opportunity for prospective members to taste produce since freshness and taste are some of the highest rated qualities of the CSA.
- Although it is difficult to cater to individual palates, sending a survey out to enrolled members before the CSA season begins to determine what they would or would not like to receive in their weekly share may help retain CSA members and help growers meet the needs of CSA members.
- Explore opportunities to provide CSA shares to other institution employees, as has been successful with St. Patrick Hospital, paying particular attention to opportunities with other cooperatives, such as the Missoula Federal Credit Union.
- Most importantly, continue the high quality customer service the WMGC is already providing. Responsiveness to customers and quality customer service is important to CSA members.

Health Food Store Perspectives

We examined the overall satisfaction of health food store customers with the WMGC by having the customers evaluate the ordering and delivery processes and product quality of the Co-op, in addition to marketing by the Co-op and the benefits and challenges of being a customer. At each store we interviewed the person responsible for making purchasing decisions. Each participant was given a code; health food store participants are noted with a “HFS” and a number. If more than one person was interviewed from a particular store the code also has a letter “A” or “B” to differentiate the different people.

Ordering

Health food store purchasers have a positive view of the Co-op's ordering process. Seven out of ten buyers rated the ordering process as very convenient, and three rated it as somewhat convenient. No interview participants felt the process was inconvenient.

Of the seven who rated the process as very convenient, three mentioned consistency as a primary reason. For example, HFS-4 appreciates the "consistent order times." Three of these health food buyers also mention that the process makes purchasing local food much more convenient for them. HFS-3A said that it is nice "Not having to do all of these orders separately. It's nice being able to group all of these orders into one order instead of having to order from one farm then call another farm and so on." HFS-2B said the convenience of ordering local food through the Co-op allows them to spend their time to "just work the customers." In addition, four health food stores like that the WMGC manager, Dave, calls them every week. HFS-1 likes it that the "Co-op always calls his cell phone." HFS-6 said that "Dave is good at calling and going down the list of what they have available."

The three health food stores that rated the ordering process as somewhat convenient would prefer to order more than once a week. HFS-3B said that "Once a week is not nearly enough. It makes me cram all my ordering into one shipment." HFS-5 also struggles ordering everything that they need in a weekly order and that they prefer to not order in bulk; but, the only way to ensure that they will get the product that they want in a once-a-week ordering system is to order in bulk.

Delivery

Health food store purchasers tend to have a positive view of the ordering process as well. Seven of the buyers rated the process as very convenient, two rated it as somewhat convenient and one rated it as not convenient.

Of those stores that rated the Co-op's delivery process as very convenient, five mentioned the consistency and promptness of the deliveries as a reason why they are very convenient. "They arrive on time from week to week," said HFS-3B. Three of these buyers also commented that they appreciate the courtesy of the WMGC's drivers.

The two buyers who rated the delivery process as somewhat convenient said the following: HFS-2B noted that the process is "not super convenient, but better than others. With the Co-op, often times, someone needs to pick-up the shipment with a forklift, then go and sort it together. The packages are reused and recycled, which are hard to differentiate. They're sorted almost randomly." HFS-4 said that the delivery occurs too long after they have ordered.

The buyer who rated the delivery process as not convenient also said that their store has to wait too long for the delivery.

Quality of Product

First, we determined what types of products these health food stores purchase, with the most frequently purchased products being produce and dairy products. In addition, our interviews with health food store purchasers explored what these buyers think about the products that they buy from the Co-op. We asked these buyers to compare the freshness, packaging, appearance, availability, quantity and prices of WMGC products to other distributors. We also asked if they were satisfied with WMGC prices given the quality of their product. Lastly, we asked if the buyers process any Co-op products and if they would be interested in purchasing more processed goods if the Co-op offered them.

When asking buyers to compare Co-op products to other distributor products, we did not specify which products they were comparing, and if they were comparing to a conventional distributor or another local distributor. These comparisons are meant to provide a general indication of the buyer’s perception of the Co-op’s products. Overall, the Co-op’s products fared well in these comparisons. Freshness was the biggest standout factor, being rated better than that of other distributors by a large majority. Appearance of the product was also rated better by a majority of participants.

Packaging seems to be the area in need of most improvement, as almost half of the participants rated this factor as worse than other distributors. Other factors of mixed opinions were availability of product and quantity of product. Full results of these comparisons can be seen in Table 3.

Table 3. Health Food Store Comparison of WMGC Product Quality to Other Distributors. (n=10)

Product Characteristic	Better	Same	Worse	Don’t Know
Freshness	9	1	0	0
Packaging	1	4	4	1
Appearance	6	4	0	0
Availability	4	3	3	0
Quantity	1	5	3	1
Price	3	5	1	1

Price. Three health food store purchasers rated price as better, five as the same, and one rated the price as worse compared to other distributors (one buyer did not respond).

As a follow-up, we asked if they are satisfied with the WMGC's prices given the quality of their product, to which all 10 respondents responded that they are satisfied with the Co-op's prices given the quality of the product.

Processed Products. Four buyers process goods that they buy from the Co-op while six do not. When asked if they would buy more processed goods from the Co-op if they were available, four health food store buyers said they would, while six said that they would not. It is important to note that many buyers indicated that it depends exactly what the Co-op offered and at what price before these buyers responded with a yes or no.

Marketing to Health Food Stores

We asked the health food store customers about two different marketing strategies: (1) How effective the Co-op is at marketing to the particular store, (2) How Co-op products are marketed to the end consumer. We also inquired about the meaning of the Organic and Homegrown certification labels to the particular store's customers.

Marketing to Stores. When asked whether the Co-op is adequate in marketing to health food stores all 10 respondents said "yes." Aspects of the Co-op's marketing that health food stores found particularly helpful were the weekly availability bulletins and the Co-op's website. Another buyer spoke on the communication aspect of marketing the store has with the Co-op. "Personal communication with Jim and Dave and Steffen has been good – we've been communicating with them on a really regular basis, which is fundamental to cooperatives."

Point of Sale Marketing. Farm information cards were also discussed favorably during a number of interviews. Although the cards did not arrive at the store consistently, six stores mentioned their effectiveness at the point of sale. One buyer said, "The cards that show what farm the food comes from and describes the farm are great. The customers seeing these visual aids really helped. Customers are more likely to buy the produce affiliated with the farms that have these cards- many [customers] are usually only willing to buy certified organic, but they are willing to buy the produce that have these cards about the farms even if it's not certified organic."

Montana Homegrown and Certified Organic. A series of questions asked how meaningful the terms organic and Homegrown are to the store's customers. All 10 participants stated the organic designation is "very meaningful" to their customers. When asked how meaningful

Homegrown products were to their customers, only one replied “very meaningful.” Three participants believed Homegrown was not meaningful to their customers and two respondents did not even know what Homegrown meant. We then asked if the buyer would like to see a larger presence of Homegrown goods in their store. Six respondents replied no. One respondent explained, “Customers want “Organic” or “Local”. [The store] understands “Homegrown”, but customers don’t.” Another respondent said, “It’s not a well-known term. I think customers think of Homegrown as a literal term, not a certification. If people knew the certification, that would be helpful. It may be better, but we don’t know that.”

Several stores expressed openness to educating their customers about what Homegrown is and helping however they could in this education process. “People like local! Education on where their food comes from is necessary and very good for everyone. People really enjoy finding out where their food comes from!” Another buyer said, “People don’t know what it is, so it doesn’t help me sell anything. It creates a new opportunity for educating customers.” Finally, six of the stores mention that they would be willing to buy more Homegrown product if the proper educational tools were used. “The [Co-op] can either sell more certified organic, or conduct a very well executed plan to educate them (consumers) about what Homegrown is.”

Benefits of purchasing from the WMGC

Buyers were asked to list their top three benefits of working with the Co-op. Of the varied answers we received, several themes emerged, including personal relationships, ease of local purchasing, and quality.

Personal Relationships. The personal relationships the stores are able to have with the Co-op was a benefit expressed by nine of the buyers interviewed. This was expressed through the face-to-face interactions as HFS-9 explained, “You get to know the people that deliver to you. You get to know their faces.” The importance of the personal relationship was also expressed through the responsiveness, effectiveness and pride the Co-op staff has in their jobs. “They stand by and back up their product. If I don’t like the product when it’s delivered, [they] work with me by either giving me credit, a discount, or replaced what I don’t like with a different product so I’m not affected by not having the product I originally wanted.”

Ease of Local Purchasing. The majority of buyers listed the ease of local purchasing as a benefit of buying from the Co-op. This sentiment was expressed several ways: as expanding access to local food, simplifying local purchasing, and consolidating local sourcing. The Co-op’s ability to aggregate the product, rather than having the store work with many farmers directly, gives more stores the ability to purchase locally. Many buyers expressed an appreciation for simply buying local as a benefit of the WMGC. HFS-8 said, “Availability is being addressed by multiple

growers and small growers can focus on farming rather than burning up a lot of gas running around everywhere.” A couple of buyers also expressed appreciation at how well run and organized the Co-op is. This attribute only makes it easier for customers to use the WMGC as a distributor.

Quality. The quality of product was another important benefit expressed by the buyers. As a benefit of buying from the Co-op, HFS-3B describes, “Being able to offer a local product to our customer base comes down to quality and freshness that’s not traveling thousands of miles to get here.”

Challenges of Purchasing from the WMGC

Alongside the many benefits of working with the Co-op, the stores were asked to describe areas of improvement the Co-op may want to address. As indicated in previous sections, the themes to emerge here involved packaging and labeling and quantity of produce, and Homegrown education.

Packaging and Labeling. One of the more prominent themes to arise was the need for a more consistent packaging and labeling system. One buyer said, “Consistent packaging – standardized boxes like, broccoli in broccoli boxes, that sort of thing. That would improve quality of boxes and labels.” Another buyer stated, “It would be great if they could have a more professional production system in packaging.”

Homegrown Education. A few buyers also expressed a need for better education about the Homegrown label. HFS-5 explains as a suggestion, “either more certification for organic, or a very well executed plan to educate about what Homegrown is.” Another health food store purchaser stated, “If they’re going to do Homegrown, they need more education, awareness and marketing for it.”

Quantity. More consistent quantity of produce was also requested. One buyer stated that when they order twice a week, several of the items they needed have already been sold. This forces the buyer to order one item in bulk per week to ensure the stores gets what they ordered.

Miscellaneous. Finally, information about the Co-op at point of sale was requested by a buyer, and that the delivery time, from when the store ordered the product to when it is actually delivered, is shortened, along with more deliveries. Another suggestion was to expand the Co-op into other regions around Montana.

Market Considerations

Health food stores continue to be a viable, high-value market for Co-op products. Success in this market has already been proven for the WMGC and it is evident that customers are generally happy with the service and products they receive. Additionally, farmers are able to get better prices for their products in this higher-end market. However, new, efficient opportunities may be harder to come by since the WMGC already has a strong presence in the health food store market.

The Co-op has the opportunity to make a strategic decision about which markets may be most beneficial and efficient to pursue. Some considerations we recommend thinking about in regards to the health food store market include:

- How can marketing be improved, especially in preserving farmer identity and Homegrown education?
- Are there other health food stores outside of the Missoula area that may also help with delivery efficiency and make sense to pursue?
- Is there a particular niche or further health market opportunities within Missoula?

Institutional Perspectives

We examined the overall satisfaction of institutional customers with the WMGC by having the customers evaluate the ordering and delivery processes and product of the Co-op. We also asked interviewees to respond to questions regarding WMGC marketing and the benefits and challenges of working with the Co-op. At each institution we interviewed the person responsible for making purchasing decisions. Each participant was given a code; institutional buyer participants are noted with an “INST” and a number.

Ordering

When asked to rate the ordering process with the Co-op as “very convenient, somewhat convenient, not convenient, or don’t know”, two institutions said the process was “very convenient”. The other two described their experience with the ordering process as “somewhat convenient.” Those who found the process to be very convenient mentioned helpfulness and availability of WMGC staff when ordering as factors contributing to convenience. The two institutional buyers who rated the ordering process as only somewhat convenient both commented that an online ordering system would offer more convenience. INST-1 recalled having to wait to receive the list of available items from the Co-op, then discuss with staff which orders to purchase, then call back to place an order. INST-1 said, “It’s not as convenient as online ordering from other distributors, but is more personable, which is a plus.”

Delivery

Three of four institutions rated the delivery process as “very convenient”, while only one said it was “somewhat convenient”. The three institutions that viewed the process as very convenient mentioned the consistency of deliveries both in regard to punctuality and accuracy in supplying the correct product order. One institution said that when orders were not accurate, they were corrected “on the spot”. Another institution appreciated the “good communication” with the driver at the delivery site. The institution that rated the delivery process as “somewhat convenient” did so because they found it more convenient when their orders could be delivered twice per week. However, the buyer at that institution said that they understood the Co-op couldn’t be as convenient as a larger distributor.

Quality of Product

First, we determined what types of products the institutions purchase. Three institutions purchase produce, and one purchases dairy. In addition, our interviews with institutional purchasers explored what these buyers think about the products that they buy from the Co-op. We asked these buyers to compare the freshness, packaging, appearance, availability, quantity and prices of WMGC products to other distributors. We also asked if they were satisfied with WMGC prices given the quality of their product. Lastly, the interview asked if the buyers process any Co-op products and if they would be interested in purchasing more processed goods if they were offered by the Co-op.

When asking buyers to compare Co-op products to other distributor products, we did not specify which products they were comparing, and if they were comparing to a conventional distributor or another local distributor. These comparisons are meant to provide a general indication of the buyer’s perception of the Co-op’s products.

All four institutions stated that the quality of the Co-op’s products were better than that of other distributors. Three buyers indicated that the appearance is also better than other distributors’ products, and one institutional buyer found it to be the same. Three indicated that price of the Co-op’s products is “worse” than other distributors, however all agreed that given the quality of the products they are satisfied with the prices they pay.

Packaging, availability, and quantity all received mixed reviews; responses are shown in Table 4.

Table 4. Institutional Buyer Comparison of WMGC Product Quality to Other Distributors. (n=4)

Product Characteristic	Better	Same	Worse	Don't Know
Freshness	4	0	0	0
Packaging	1	2	1	0
Appearance	3	1	0	0
Availability	2	0	2	0
Quantity	1	2	1	0
Price	0	1	3	0

Processed Products. Two institutions process products once they are received from the Co-op, and three institutions indicated they would be interested in buying more processed products if they were available, assuming the price and quality met their standards. When asked which products respondents would like to buy that were not currently offered, institutions mentioned a desire for chopped lettuce and frozen fruits and vegetables.

Marketing to Institutions

We asked institutional customers about two different marketing strategies: (1) How effective the Co-op is at marketing to the particular institution, (2) How Co-op products are marketed to the end consumer. We also inquired about the meaning of the Organic and Homegrown certification labels to the particular store’s customers.

Marketing to Institutions. Two of their buyers felt the Co-op does an adequate job of marketing itself to them. One noted liking the weekly availability email and the face-to-face communication, another said that the Co-op did not even have to market to them because the institution had sought them out. A third institution stated they wished the Co-op would be more persistent with them as a reminder that the Co-op’s products are available. This question was non-applicable to the fourth institution.

During our interviews we also inquired as to how the institutions’ relationships began with the Co-op. We found that the stories with all four institutions were consistent with the above comment about the institution seeking out the WMGC. In each case, a third party suggested the institution start purchasing local food and the Co-op was recommended as a possible avenue for doing so. We believe the Co-op has an opportunity to begin marketing directly to institutions, as was proven successful with many health food stores.

One institution was able to start purchasing WMGC products using federal dollars from the Fresh Fruits and Vegetables Program. After the first year of this relationship, the institution was then able to prove that it was feasible to add WMGC products to the regular budget. This opportunity may be relevant to other institutions and help the Co-op get their foot in the door with them.

Another avenue to pursue is offering CSA shares as a benefit to institution employees. This process was a great success for one institution and could be a viable model for others as well.

Point-of-Sale Marketing. We found that all institutions used their own marketing materials for their food service. In addition, organic and homegrown labels were either somewhat or not meaningful to all institutional customers. In fact, one institution specifically noted that they would not want to advertise organic or homegrown as they felt it might be perceived as wasteful spending on the institution's part. Also, the Co-op's products may simply be labeled as "local" or "Montana" food instead of a WMGC or specific farmer product. These results indicate that although an institution may buy local food products, specific labels or the origin of the food may not fully trickle down to the end consumer.

For these reasons, if the Co-op decides to pursue greater institutional sales, direct marketing to potential institutional customers will be more effective than concentrating on point-of-sale marketing materials. Co-op branded marketing materials for institutions may be an area for potential growth in the future, once the WMGC has more experience in this market and can make more informed strategic marketing decisions.

Benefits of Buying from the WMGC

Throughout our interviews with institutional buyers a few main themes emerged as benefits these customers receive when working with the Co-op. The benefits mentioned most were: the high quality of produce received, the great relationship they have with the Co-op, and the ability to access local products.

High Quality Products. Institutional buyers unanimously felt the Co-op consistently provided them with high quality produce. Three institutions specifically stated the quality of product as being the best benefit of buying from the WMGC. As previously noted, when the institutions were asked to compare the Co-op's products to products from other distributors, Co-op products were consistently ranked better than the others -- so much so that institutions were comfortable paying a higher price for this level of quality.

It is important that these institutions explicitly listed the high quality as a benefit of buying from the WMGC. Historically, institutions such as hospitals and schools were not known for the quality and taste of the cuisine in their foodservice. However, food service is becoming more of a priority as consumers are starting to care more about their food. Serving high quality food allows institutions to stand out in the marketplace and can bring them more notoriety.

Strong Relationships. When specifically asked what the institutions felt the top three benefits were of buying from the Co-op, one institution mentioned their “special relationship” with the Co-op, while another noted the ability to talk and plan with the Co-op face to face as a benefit. Throughout the interviews three institutions spoke about the great communication between them and the Co-op, which we consider a key aspect in fostering these positive relationships. Some examples of statements that showed an appreciation for this line of communication are references to the helpfulness of coordinators of the WMGC when ordering products or signing employees up for CSA shares, the willingness of the Co-op to accommodate the institution’s needs, the personable ordering process requiring verbal communication (even though online ordering would be more convenient), and the great communication and service when deliveries are made.

Other recurring themes amongst institution interviews were the high quality of produce from the WMGC, and timely, convenient deliveries. These accounts signify a confidence in the Co-op, which fosters a sense of trust between the Co-op and the institutions and further builds upon these positive work relationships.

Consistent, honest, and helpful communication helps the Co-op to build a strong relationship with their institutional customers. We also see this as a strong benefit from the health food store respondents. We believe this is a core strength of the Co-op and note that this should be an area of high importance to continue this level of personable, high-level customer service. This relational aspect of working with the Co-op is clearly valued by many of its customers and is something that may be lacking in the working relationships these stores and institutions have with other distributors. By continuing to promote personal relationships built on quality and trust, the Co-op allows itself to stand out from other distributors that may be competitors.

Providing Local Food. All institutions noted as a benefit that buying from the Co-op allows them to serve local food. This benefit was viewed differently between institutions. One institution noted that buying from the WMGC allows them to serve products from a larger mix of farmers than they would otherwise be able to. Another institution liked buying local food to have that money benefit area farmers. Two other institutions stated that buying from the Co-op makes it easier and more convenient to buy local. As one institution noted, “We really like farmers, but

we don't like talking to them." Another expressed appreciation at the efficiency of not having to order from 40 different farmers by stating, "They [the WMGC] make it possible for institutions and restaurants to get in on the local food action too."

This ability to make purchasing local food convenient for institutions is very important. Whatever the ideals or values behind an institution's desire to serve local food, the fact is that they are busy and work with high volumes, and therefore need an efficient, convenient avenue for purchasing local product. The WMGC may serve as the impetus for an institution to actually move forward with local purchasing, instead of being discouraged by time and efficiency constraints.

Challenges of Purchasing from the WMGC

In addition to benefits, we asked about possible suggestions institutional buyers may have for the Co-op. Two respondents mentioned expanding or focusing the Co-op's ability on processed and value-added goods. Other suggestions included: expanding the Co-op itself (either by adding more members or starting a new one in a different area), further extending the growing season, work on providing higher quantities of some products to be more in line with demand, and deciding on a particular markets to focus the Co-op's energy on.

Market Considerations

Institutions provide a new market opportunity for the Co-op, an opportunity that may act as an incentive for WMGC members to work more closely with the Co-op in order to gain access to this market. Serving institutions could also help local food become more mainstream because the food ends up being consumed by people who might not otherwise choose to eat locally (i.e. hospital patients and school children). However, as discussed in the marketing section the Co-op brand, farmer identities, and product labels (Organic and Homegrown) may be diluted once the food gets to the end consumer.

The Co-op has the opportunity to make a strategic decision about which markets may be most beneficial and efficient to pursue. Some considerations we recommend thinking about in regards to the institutional market include:

- How may serving more institutional markets affect product demand, and can the Co-op sustain a possible shift to higher quantities?
- Are there more opportunities to process value-added products that make sense both for the Co-op and institutions?
- What institutions make sense to pursue as new customers and how can the Co-op effectively market themselves to these potential customers?

Role of the WMGC from Customers' Perspectives

From the perspective of its institutional buyers, health food store buyers and CSA members, the Co-op plays a critical role in the regional food system of Western and Central Montana. As previously mentioned, the number one reason for current CSA members wanting to continue their membership is to support the local food system and economy. In fact, 91.9% of the CSA members who filled out the survey say that supporting local farming is very important to them.

Institutions and health food stores value being a part of the regional food system as well. HFS-3A proclaimed, "We're glad to be a part of the local Montana food system with WMGC!" Specifically, institutional and health purchasers value the aggregation and distribution of locally produced food from a variety of local growers. Nine of the institutional and health food store buyers mention the aggregation and distribution as a critical function of the WMGC in the regional food system. These buyers view this consolidation of local food as a great convenience that allows them to more easily purchase local food. HFS-2B lists, "simplified local purchasing" as a top benefit of buying from the Co-op and INST-1 says that the "ease of local purchasing" is also a top benefit for them. More than just the increased convenience of buying local, three buyers commented that the WMGC expands access to local food. Institutions such as public school districts now have a means to access local food that they otherwise might not have. INST-1 said, "[The] Co-op plays a crucial role in organizing and aggregating to serve their markets. [The] Co-op is almost an entire supply chain up to the consumer."

Several buyers also appreciate that the Co-op gives more local farmers access to markets that the farmers otherwise could not access. HFS-3A said the following about the role of the WMGC in the local food system: "It's huge. It gives growers the opportunity to distribute food that they wouldn't otherwise be able to. Getting products to market is hard, so WMGC allows them to do that which is huge." INST-4 reiterated this sentiment when they assert that the "WMGC gives a way for smaller farmers to get goods into the market in a sustainable way." Several buyers appreciate the fact the WMGC provides a reliable framework and distribution system that allows purchasers to support a larger number of local farmers.

The WMGC's consistent, consolidated supply of quality and fresh food expands regular access to healthy, local food for its CSA members, customers of health food stores, and for those who eat at institutions. As access increases to local food, so does the amount of money that goes back to local farmers and re-circulates into the Montana economy.

Conclusions on Markets of the WMGC

Results from our study indicate that the WMGC is a highly valued local distributor to its customers that provides high quality products, convenient and accessible local food, reliable delivery, and excellent working relationships. In fact, appreciation for the relationship between the buyers we spoke with and the WMGC came up throughout our interviews. This personal touch is an important aspect of the WMGC's business and is one that may differentiate the Co-op as a distributor in our regional marketplace.

Providing adequate quantities, delivery days, pricing, availability, and education about certification labels are all areas in which the Co-op might better improve itself, but the pillars for continued success are all there. The Co-op is poised for future growth, and now is the time to think strategically about what markets most complement the Co-op's abilities. It is essential to ensure that the grower membership and Co-op infrastructure are all on-board with the organization's growth trajectory. Once all these pieces are fit into place word can really spread about how delicious local truly is.

Interview Guide with WMGC Staff

WMGC BASE INTERVIEW GUIDE

Introduction. Thanks for taking the time to participate in this interview. As you know, our class is doing this research with the Western Montana Growers Cooperative.

Before we start, I'd like to let you know that we will not attribute any direct quotes to you in our writing. Since it could be obvious who we spoke with at the Growers Cooperative, if there is any sensitive material, we will contact you first before we include it in our report and we encourage you to speak freely about your experiences and ideas.

We'll be presenting our research to the WMGC in December and we hope you will come listen. We will let you know when that will be happening.

With your permission, I'd like to record this interview. This ensures that your views are most accurately recorded. Is that ok?

If yes, turn on recorder.

Current Operations:

To start off I would like to ask you some questions about your history working at the WMGC.

Role

1. What is your role at the Western Montana Growers Cooperative?
2. How long have you been employed in your current position?
3. As an employee, what is the most rewarding thing about your work with the co-op?
4. As an employee, if there was one thing that you could change about your job, what would it be?

Vision for the Cooperative

For these last questions I would like to speak with you about the mission of the WMGC and your vision for the future of the cooperative.

8. What is the mission of the growers cooperative?

Probe: In what ways do you think WMGC is fulfilling this?

Probe: What areas are most in need of improvement?

9. In what ways do you think the members buy into the mission of the cooperative?
10. Are there opportunities or services you wish the co-op would offer its producer members that it does not currently offer?
11. Do you think the co-op should expand? If so, how?
Probe: Why do you think expansion is important?
12. Stepping back now from your own experience with the co-op, what do you think the role of the WMGC is in our local and regional food system?
Probe: Is it important that it is a cooperatively run business and if so, why?
13. Try to think about the future and imagine the co-op in 5 years. What would you like it to look like?

Thank you again for taking the time to speak to us. We really appreciate and value your input. Is there anything else we haven't yet covered that you'd like to discuss?

Appendix B

Cooperative Principles

WHAT IS A COOPERATIVE?

A cooperative is an organization that is owned and controlled by the people who use its products, supplies, or services. Although cooperatives vary in purpose, they share in common the fact that they are formed to meet the specific objectives of members, and are structured to adapt to members' changing needs. Self-reliance and self-help are the hallmarks of cooperatives.

Although cooperation, that is, people working together for their mutual benefit, has been practiced throughout human history, the cooperative as a form of business organization began during the Industrial Revolution. Cooperatives were useful for promoting the interests of the less powerful members of society. Farmers, producers, workers, and consumers found that they could accomplish more collectively than they could individually.

Cooperatives can be used to address a multitude of shared needs:

Producers like farmers, artisans, or industrialists use cooperatives to market or process their goods jointly.

Workers in areas as diverse as bicycle sales, baked goods production, and catalog sales use cooperatives to create employment that offers many of the benefits of ownership—more control over their work, and wages or income that directly correspond to the economic results of the business.

Consumers use cooperatives to gain better prices, acquire unique goods and services, or to meet social or cultural desires.

Private business or public entities can use cooperatives to gain purchasing power through bulk buying, acquire products or services that are difficult to obtain individually, or share administration of certain projects to reduce overhead costs.

The International Cooperative Alliance (ICA), composed of cooperative leaders from around the world, has established seven fundamental principles that guide cooperatives:

1. **Voluntary and open membership.** Cooperatives are voluntary and non-discriminatory organizations. Membership is open without regard to gender, social class, race, political affiliation, or religious beliefs.
2. **Democratic member control.** Cooperatives are democratic organizations controlled by their members, who actively participate in setting policies and decision making.
3. **Member economic participation.** Members contribute equitably to, and democratically control, the capital of their cooperative.
4. **Autonomy and independence.** Cooperatives are autonomous, self-help organizations controlled by their members.
5. **Education, training, and information.** Cooperatives provide education and training for their members, elected representatives, managers, and employees so they can contribute effectively to the development of their cooperatives.
6. **Cooperation among cooperatives.** Cooperatives serve their members most effectively and strengthen the cooperative movement by working together.
7. **Concern for community.** While focusing on members' needs, cooperatives work for the sustainable development of their communities through policies accepted by their members.

Appendix C

WMGC Bylaws

**BYLAWS
OF
WESTERN MONTANA GROWERS COOPERATIVE**

**BYLAW 1
MEMBERSHIP**

Section 1.1 Eligibility for Membership. Producers of agricultural products who reside in the territory served by the Cooperative shall become members of the cooperative by:

- (1) Applying for membership;
- (2) Being approved for membership by the Cooperative's Board of Directors;
- (3) Becoming the holder of one (1) membership certificate, value of which will be determined by the Board of Directors; and
- (4) Entering into an annual Producer Commitment Agreement with the Cooperative.

Section 1.2 Termination of Membership. Membership in this Cooperative may be terminated by the Board of Directors if any of the following events occur:

- (1) A member ceases to be an agricultural producer or has become ineligible for membership for any reason;
- (2) A member has failed to patronize this Cooperative for a period of one year or more;
- (3) A member that is an individual dies, or a member that is not an individual ceases to exist as a legal entity and leaves no successor; or
- (4) The Board of Directors by resolution finds that a member has:
 - (i) intentionally or repeatedly violated any provision of the Cooperative's Articles of Incorporation, its Bylaws, or its rules and regulations;
 - (ii) breached any contract with or obligation to the Cooperative or any of its members including, but not limited to, the Producer Commitment Agreement; or
 - (iii) willfully obstructed any lawful purpose or activity of the Cooperative.

Section 1.3 Consequences of Membership Termination. Upon termination of membership, voting rights and other rights of membership shall cease. Termination of membership alone shall not affect the rights or liabilities of either the member or the Cooperative under any individual contract.

Section 1.4 Evidence of Membership. Membership in the Cooperative shall be evidenced by the records of the Cooperative. Membership certificates will be issued by the Board of Directors as evidence of membership.

Section 1.5 Nonliability of Members. Members and patrons of the Cooperative are neither obligated to pay nor liable upon any Cooperative obligations.

BYLAW 2 MEETINGS OF MEMBERS

Section 2.1 Annual Meetings. The Annual Meeting of the members of this Cooperative shall be held annually at the principal place of business of the Cooperative, or at any other place conveniently located within the area served by it, as may be determined by the Board of Directors. The Annual Meeting shall be held on such date, place and hour as determined by the Board of Directors. The notice of the meeting shall state the date, place and hour of the meeting. At the Annual Meeting, the members shall transact business as may properly come before the meeting.

The officers of the Cooperative must submit reports to the members at the Annual Meeting which cover the business of the Cooperative for the previous fiscal year, and which show the condition of the Cooperative at the close of the fiscal year.

Section 2.2 Special Meetings. The Chairperson shall cause notice of a Special Meeting of members to be given upon a written petition by at least twenty percent (20%) of the members, or upon a majority vote of the Board of Directors. The notice shall state the time, place and purpose of the Special Meeting. If a Special Meeting is called by virtue of a member petition, the notice of such meeting shall be issued with ten (10) days of presentation of such petition and the Special Meeting shall be held within thirty (30) days from the date of presentation of such petition. No business shall be transacted at a Special Meeting except that stated in the notice of the meeting.

Section 2.3 Notice. Notice shall be given by the Secretary of all Annual Meetings and Special Meetings of the members by mailing a notice of the meeting to each member at the member's last known address not less than ten (10) nor more than thirty (30) days prior to the date of the meeting. The failure of any member to receive the notice shall not invalidate any action which may be taken by the members at the meeting.

Section 2.4 Quorum. Five (5) members or fifty percent (50%) of the membership, whichever is a larger number, shall constitute a quorum at any properly called annual or special membership meeting. Members represented by signed votes may be counted in computing a quorum only on those questions as to which a signed vote is taken. If less than a quorum is present at any meeting, a majority of votes present in person may adjourn the meeting from time to time without further notice.

The attendance of a sufficient number of members to constitute a quorum shall be established by a registration of members of the Cooperative who are present at the meeting, which registration shall be verified by the Chairperson and Secretary, and shall be reported in the minutes of the meeting.

Section 2.5 Voting.

- a) Each member shall be entitled to one vote and no more upon each matter submitted to a vote at a meeting of the members.
- b) All questions shall be decided by a vote of a majority of the members voting thereon in person, except as otherwise provided by law, the Articles of Incorporation, or these Bylaws.
- c) Voting by proxy and cumulative voting shall not be allowed, but signed votes may be used when specifically authorized by resolution of the Board of Directors. When so authorized, signed votes shall be valid and entitled to the same force and effect as a vote in person if the member has been previously notified in writing of the exact motion or resolution upon which the vote is taken.
- d) A member that is not a natural person must designate and authorize a representative to cast its vote in the affairs of the Cooperative. The designation must be in writing, must be properly authorized by the member, and must be provided to the Secretary of the Cooperative. Such a written designation will remain effective until it is superseded by a more recent written designation meeting the same criteria. In the absence of written notice that some person has been designated to represent a member who is other than a natural person, such member may be represented by any of its principal officers. No individual may be authorized to cast more than two votes for a nonperson member entity in addition to his or her own membership vote at a membership meeting.

Section 2.6 Order of Business. Insofar as practical, the order of business at the Annual Meeting and, where applicable, at all other meetings of the members shall be:

1. Registration of Members;
2. Call of Meeting to Order;
3. Proof of Notice of Meeting and the Report as to the Members Present in Order to Determine the Existence of a Quorum;
4. Reading of Minutes of Prior Meeting;
5. Reports of Officers and Committees;
6. Election of Directors;
7. Unfinished Business;
8. New Business; and
9. Adjournment.

Section 2.7 Action Without a Meeting. Any action which may be taken at a member meeting may be taken without a meeting if a writing setting forth and approving the action shall be signed by a majority of the members entitled to vote on such action.

Section 2.8 Procedure. The rules of parliamentary practice comprised in Robert's Rules of Order, most recent edition, shall govern this Cooperative in all situations in which they are applicable and are not inconsistent with the Articles of Association of this Cooperative or these Bylaws.

BYLAW 3 Directors

Section 3.1 General Powers. The Board of Directors shall govern the business and affairs of the Cooperative and shall be empowered to adopt all necessary rules and regulations not inconsistent with the Articles of Association or Bylaws. The rules and regulations may be established for the operation of the business, the guidance of the officers and other employees, and the management of the Cooperative. The Board of Directors of the officer or officers to whom the power is delegated, shall hire and fire employees of the Cooperative, and determine duties, salaries, and other conditions of employment.

Section 3.2 Number, Qualifications and Terms of Office. The government of this cooperative and the management of its affairs shall be vested in a Board of Directors composed of a minimum of five (5) members elected from the Cooperative's membership. The terms of office shall be for three (3) years except for the initial staggered terms under Section 3.3. All directors shall hold office until their successors are elected and qualified. Any vacancy in the Board, other than by expiration of a term of office, shall be filled by a majority vote of the remaining directors. If a vacancy in the Board of Directors extends beyond the next annual meeting, such vacancy shall be filled until such meeting at which meeting a director shall be chosen by the members for the unexpired term of such vacancy; otherwise the vacancy shall be filled by the directors for the unexpired term.

Section 3.3 Director Elections. At the first meeting following the adoption of these Bylaws, two (2) directors shall be elected/appointed to serve for a term of one (1) year, two (2) directors shall be elected/appointed to serve for a term of two (2) years, and one (1) director shall be elected/appointed to serve for a term of three (3) years. Annually thereafter as many directors shall be elected/appointed to serve for a three (3) year term as there are regular vacancies in the number of directors. The Board of Directors may establish a Nominating Committee, which shall be responsible for placing into nominating the names of qualified candidates. Moreover each member present at the Annual Meeting and eligible to votes may place into nomination at the meeting the names of eligible candidates. Voting shall be by ballot and each member may vote for one (1) candidate for each vacant director position. The candidates receiving the highest numbers of votes for the vacant positions shall be elected to the Board.

Section 3.4 Annual Meeting. Within thirty (30) days after each Annual Meeting of members, the Board of Directors shall meet for the purpose of electing officers of the Cooperative and for the transaction of such other business as shall come before the

meeting. The Annual Meeting of the Board of Directors shall be held at such time and place as may be fixed by resolution adopted by a majority of the whole Board of Directors.

Section 3.5 Regular Meeting. Regular Meetings of the Board of Directors shall be held from time to time at such time and place as may be fixed by resolution by a majority of the whole Board of Directors.

Section 3.6 Special Meeting. Special Meetings of the Board of Directors may be called by the Chairperson, the Secretary or by any three (3) of the Directors and shall be held from time to time at a time and place as may be designated in the notice of the meeting.

Section 3.7 Notice of Meetings. Notice of each annual regular or special meeting of the Board of Directors shall be given by the Chairperson or Secretary who shall give at least seven (7) days prior notice of the meeting to each director by mail, telephone, telephonic facsimile transmission, telegram, or in person. Notice shall be deemed given upon mailing, if notice is given by mail.

Section 3.8 Waiver of Notice. Notice of any meeting of the Board of Directors may be waived either before, at or after the meeting, in writing signed by each director. A director, by attendance and participation in the action taken at any meeting of the Board of Directors, shall be deemed to have waived notice of such meeting.

Section 3.9 Quorum. A majority of the whole Board of Directors shall constitute a quorum for the transaction of business except that, when a vacancy or vacancies exist, a majority of the remaining directors shall constitute a quorum. All questions shall be decided by a vote of a majority of the directors present at a meeting. Any one or more members of the Board of Directors or any committee thereof may participate in a meeting of the Board of Directors or any such committee by means of a conference telephone or similar communications equipment allowing all persons participating in the meeting to hear each other at the same time. Participation by such means shall constitute presence in person at a meeting.

Section 3.10 Removal. Any director may be removed from office, for cause, by a majority vote of the members at an Annual Meeting or a Special Meeting called for that purpose. In case of the removal of a director, the members may elect another director to fill the vacancy for the unexpired term at the same meeting.

Section 3.11 Executive Committee. The Board of Directors may appoint an Executive Committee of not less than three directors. The Executive Committee shall have authority to exercise all powers of the full Board of Directors between the meeting of the Board except,

1. Powers reserved by the board itself.
2. Apportionment or distribution of proceeds.
3. Election of officers.

4. Filling of vacancies in the board.
5. Amendments to the bylaws.

Section 3.12 Committees. The Board of Directors may establish committees from time to time making such regulations, as it deems advisable, with respect to the membership, authority and procedures of such committees.

Section 3.13. Compensation. Directors who are not salaried officers of this Cooperative may receive such fixed sum per meeting attended or such fixed annual sum as shall be determined, from time to time, by resolution of the Board of Directors. All directors may receive their expenses, if any, of attendance at meetings of the Board of Directors or any committee thereof. Nothing in these Bylaws shall be construed to preclude any director from serving the Cooperative in any other capacity and receiving proper compensation for the service.

BYLAW 4

Officers and Employees

Section 4.1 Officers. The officers of this Cooperative shall be a Chairperson, a Vice-Chairperson, a Secretary, and a Treasurer, who shall be elected in the manner as provided in Section 4.7 of these Bylaws. The offices of the Secretary and Treasurer may be combined and when so combined shall be termed "Secretary-Treasurer". The clerical work of the secretary and treasurer may be delegated by the Board of Directors. The Chairperson, the Vice-Chairperson, the Secretary, and the Treasurer shall be members of the Board of Directors.

Section 4.2 Chairperson:

- (a) Shall preside at all meetings of the members and the Board of Directors;
- (b) May sign any deeds, mortgages, deeds of trust, notes, bonds, contracts, or other instruments executed on behalf of this Cooperative, except in cases in which the signing and execution thereof shall be expressly delegated by the Board of Directors or by these Bylaws to some other officer or agent of the Cooperative, or shall be required by law to be otherwise signed or executed; and,
- (c) In general, shall perform all duties incident to the office of the Chairperson and such other duties as may be prescribed by the Board of Directors from time to time.

Section 4.3 Vice-Chairperson: In the absence of the Chairperson, or in the event of the inability or refusal to act, the Vice-Chairperson shall perform the duties of the Chairperson, and when so acting, shall have all the powers of and be subject to all of the restrictions upon the Chairperson; provided, however, that in the case of death or resignation of the Chairperson, the Board of Directors may declare the office vacant and elect a successor. The Vice-Chairperson shall also perform such other duties as from time to time may be assigned by the Board of Directors.

Section 4.4 Secretary:

- (a) Shall cause minutes of the meetings of the members, of the Board of Directors, and of any executive committee to be kept;
- (b) See that all notices are duly given in accordance with these Bylaws, or as required by law;
- (c) Supervise custody of the records of the Cooperative;
- (d) Cause a register of the names and post office addresses of all members to be kept; and
- (e) In general, perform all duties incident to the office of Secretary and such other duties as from time to time may be assigned by the Board of Directors.

Section 4.5 Treasurer: The Treasurer shall supervise the custody of all funds, securities and property of the Cooperative. The Treasurer shall cause deposit of all funds in the name of the Cooperative and cause disbursement of the same upon the authority of the Board of Directors. The Treasurer shall perform such other duties as may be prescribed by the Board of Directors.

Section 4.6 Delegation of Responsibilities: Other Officers: Notwithstanding the duties, responsibilities and authorities of the directors and officers provided for in these Bylaws, the Board of Directors by resolution may, except as otherwise limited by law, delegate, wholly or in part, the responsibility and authority for, and the regular and routine administration of, one or more of such officer's duties to one or more agents or other officers of the Cooperative who are not directors.

The Board of Directors shall appoint a general manager who shall manage the affairs of the Cooperative, under the supervision of, and in accordance with the policies of, the Board of Directors. The Board of Directors may elect such other officers from time to time, and in such event shall establish appropriate duties and responsibilities for any such officers.

Section 4.7 Compensation. The officers of the Cooperative shall receive compensation for their services as may be determined, from time to time, by resolution of the Board of Directors.

Section 4.8 Election of Officers: Vacancies. At its Annual Meeting, the Board of Directors shall elect from its number, a Chairperson, a Vice-Chairperson, a Secretary, and a Treasurer. The offices of the Secretary and Treasurer may be held by one person and when so combined, shall be termed, "Secretary-Treasurer". Election for persons to fill any other offices established by the Board of Directors pursuant to Section 4.1 of these Bylaws shall be held at the Annual Meeting of the Board of Directors or at any other meeting of the Board of Directors, provided that notice of such election has been given in the notice of such meeting. The officers shall hold their offices until their successors have been elected and have qualified, except as provided in Section 4.8. Any vacancy in

an office shall be filled by a majority vote of the Board of Directors for the un-expired term of such office.

Section 4.8 Removal of Officers. Any officer may be removed by the Board of Directors, with or without cause, at any meeting called for that purpose. The removal, however, shall be without prejudice to the contract rights of the person to be so removed.

BYLAW 5 Indemnification and Insurance

Section 5.1 Liability of Directors, Officers, and Manager. Directors, officers and the manager (who is the person most responsible for carrying out the policies and directives of the officers or Board of Directors) are immune from civil liability for any act or omission relating to their service or function as a director, officer, or manager, except as otherwise provided in the Cooperative's Articles of Incorporation or required by law.

Section 5.2 Indemnification. This Cooperative shall indemnify each director, officer, manager, or employee of this Cooperative, and any person serving at the request of this Cooperative as a director, officer or manager of another corporation, partnership, joint venture, trust or other enterprise, against expenses, including attorney's fees, judgments, fines and amounts paid in settlements actually and reasonably incurred to the extent to which such officers, directors or managers of the Cooperative may be indemnified under the law of this state.

Section 5.3 Insurance. This Cooperative shall have the power to purchase and maintain insurance on behalf of any person who is or was a director, officer, manager, employee, or agent of this Cooperative, or is or was serving at the request of this Cooperative as a director, officer, manager or agent of another corporation, partnership, joint venture, trust or other enterprise against any liability asserted and incurred in any capacity.

Section 5.4 Bonds of Employees. The Board of Directors may require all officers, agents and employees charged by the Cooperative with the custody of any of its funds or property to be adequately bonded. Such bonds shall be furnished by a bonding company, and the cost thereof shall be paid by the Cooperative.

BYLAW 6 Operations on a Cooperative Basis

This Cooperative shall be operated on a cooperative basis. Each transaction between this Cooperative and each member and patron shall be subject to and shall include as part of its terms and provisions the Articles of Association and the Bylaws of this Cooperative. Upon contracting to market commodities to this Cooperative, each member shall be entitled to the patronage refunds, as described in these Bylaws, that arise out of the patronage transactions with the Cooperative.

BYLAW 7

Calculation on Annual Savings and Distribution of Annual Savings Based on Patronage

Section 7.1 Gross Receipts. All proceeds received by this Cooperative from any source shall be deemed to be “Gross Receipts”. This Cooperative shall account separately for gross receipts from business with or for members and patrons, and for gross receipts from sources other than business with or for members and patrons.

Section 7.2 Deductions from Gross Receipts. For purposes of making the calculations described in this Bylaw 7, this Cooperative shall account separately for deductions from gross receipts from business with or for members and patrons, and for deductions from gross receipts from sources other than business with or for members and patrons. This Cooperative shall deduct the following costs and expenses from its gross receipts from business with or for members and patrons, and from its gross receipts from sources other than business with or for member and patrons, respectively:

- (1) all operating expenses and costs;
- (2) the cost of goods sold;
- (3) the cost of services performed;
- (4) all taxes and all other necessary expenses;
- (5) reasonable and necessary reserves for depreciation, depletion, and obsolescence of physical property, and other valuation reserves, all of which shall be established in accordance with usual and customary accounting practices; and
- (6) all accounts deemed worthless by this Cooperative and actually charged off on the books of the Cooperative.

Section 7.3 Annual Savings. The remaining gross receipts after all deductions, calculated on a fiscal year basis, shall be called “annual savings”, and shall be distributed and paid as provided in these Bylaws. This Cooperative shall account separately for annual savings from business with or for members and patrons, and for annual savings from sources other than business with or for members and patrons. In determining the amount of annual savings, the amounts of gross receipts as defined in Section 7.1 above, and deductions from gross receipts as defined in Section 7.2 above, shall be adjusted so as to include only such amounts as are includable or deductible for federal income tax purposes.

Section 7.4 Allocation of Annual Savings Between Departments and Divisions.

Annual savings from business with or for members and patrons shall be distributed to the members and patrons of this Cooperative on the basis of their patronage with the various departments, divisions of operation, or functions of this Cooperative.

Section 7.5 Capital Reserve. The Board of Directors may annually set aside as a capital reserve a reasonable reserve for any necessary purpose.

Section 7.6 Manner of Distribution of Patronage Refunds. The remaining annual savings, excluding amounts allocated to capital reserves, shall be distributed to members and patrons annually as patronage refunds in cash, stock, or in the form of written notices of allocation (sometimes referred to as “equity credits”), or in any combination thereof on a patronage basis. The written notices of allocation may be qualified or nonqualified, as determined by the Board of Directors, and may be issued in non-certified form. A notice shall be sent to each member and patron showing the amount distributed to the member or patron, including the amount distributed in cash and the amount distributed in capital credits or patronage equities. The notice shall be sent not later than eight and one-half (8 ½) months after the close of the fiscal year.

BYLAW 8 Unit Retentions

Section 8.1 Unit Retain. The Cooperative may require investment in its capital in addition to the investments from retained patronage. These investments shall be direct capital investments from a retain on a per unit basis of the products purchased from its members. The unit retention, if required, shall be made on all products delivered, in the same amount per unit and shall at no time become a part of net annual savings available for patronage. Each member, by continuing to be such, agrees to invest in the capital of this Cooperative as prescribed in this Bylaw 8. Such investments shall be accounted for separately in a unit retention account set up on the books of the Cooperative. Any unit retain, prior to implementation, shall first be approved by the membership.

Section 8.2 Income Tax Treatment and Consent to Take Qualified Per Unit Retains Into Income. The Board of Directors shall have the power to determine whether any unit retain shall be a “qualified per unit retain” or a “non-qualified per unit retain” within the meaning of the Internal Revenue Code. Each person or organization that hereafter applies for and is accepted for membership in this Cooperative and each member of this Cooperative on the effective date of this Bylaw who continues as a member after such date shall, by these acts alone, consent that upon a determination of the Board of Directors that a unit retain authorized by this Bylaw 8 is to constitute a “qualified per unit retain”, the member will take the per unit retain certificate issued to the member in connection therewith into account at its stated dollar amount in the manner provided in 26 U.S.C. 1388(h) and will report such amount in the member’s income tax returns for the taxable year in which the per unit retain certificate is received.

BYLAW 9 Consent

Section 9.1 Consent to Take Patronage Distribution Into Income. Each person or organization that hereafter applies for and is accepted for membership in this Cooperative and each member of this Cooperative on the effective date of this Bylaw who continues as a member after the effective date shall, by these acts alone, consent that the amount of any distributions with respect to patronage which are made in written notices of allocation (as defined in 26 U.S.C. s 1388), and which are received by the member from

this Cooperative, will be taken into account by the member at their stated dollar amounts in the manner provided in 26 U.S.C. s 1385 (a) in the taxable year in which the written notices of allocation are received.

Section 9.2 Consent Notification to Members and Prospective Members. A copy of this Consent Bylaw, and a statement of its significance shall be given to each member, and to prospective members before they become members of this Cooperative.

BYLAW 10

Losses

Section 10.1 Netting of Losses. In the event of a loss in one or more departments or divisions of operation of this Cooperative, but not of such magnitude as to cause an overall loss for the fiscal year of the Cooperative, such loss or losses may be prorated against each of the remaining profitable departments on the basis of their respective percentage of the total net proceeds during such fiscal year.

Section 10.2 Allocation of Net Loss. In the event this Cooperative shall incur a net loss in any fiscal year, the Board of Directors, in its sole discretion, may (a) charge such net loss against any earned surplus or paid-in surplus which is unallocated, or against any unallocated reserve other than valuation reserves; or (b) may recover the amount of such loss from prior or subsequent years' net margins or savings. If such loss exceeds the total of said unallocated earned surplus and unallocated reserves, or in any event, if the Board of Directors so elects, the amount of such loss may be recovered from prior or subsequent years' net margins or savings. In no event shall the Board of Directors have the authority to make any assessment against members or patrons. This selection shall not be construed or administered in such a way as to deprive the Cooperative of the right to carry back or carry forward net operating losses to past or future years, in accordance with the applicable provisions of the Internal Revenue Code or state taxing statutes.

BYLAW 11

Fiscal Year

The fiscal year of this Cooperative shall be determined by the Board of Directors.

BYLAW 12

Amendments

These Bylaws may be amended by the members at the Annual Meeting, or at any Special Meeting for that purpose, if approved by a majority of the votes cast, provided that the notice of any such meeting contains a summary statement of the proposed amendment.

Appendix D

**Membership Agreements –including (1) Prospective Member Letter; (2) Member Application;
(3) Member Commitment Agreement; and (4) Statement of Cooperation**

MEMBERSHIP APPLICATION

Applicant's Statement. I hereby apply for membership in WESTERN MONTANA GROWERS COOPERATIVE and agree to abide by the articles of incorporation and bylaws of the association, now and hereafter in effect, copies of which have been presented to me for inspection. I certify that I am a producer of _____ (product), agree to purchase one annual membership certificate, agree to sign an annual producer commitment agreement, and have met such other qualifications for membership as have been explained to me.

After my membership shall have been in effect for one year from the date of its acceptance by the association, either party may terminate it by notifying the other party in writing of this intention. If neither of the parties to this agreement so notifies the other, annual renewal of membership certificate and producer commitment agreement will not require resubmitting this application form.

Date _____, 20 ____.

Applicant's: Name: _____

Address _____

Telephone Number _____

Social Security or EIN Number _____

Applicant's Signature _____

Acceptance. This certifies that _____ is a member of *Western Montana Growers Cooperative* and is entitled to all of the rights, benefits, and privileges of membership in the association.

Date _____, 20 ____.

Chairperson: _____

Secretary: _____

grower@wmgcoop.com

Dear Prospective Member:

Thank you for your interest in healthy food, local economies, and the Western Montana Grower's Co-op. This packet contains our by-laws, Articles of Incorporation, membership application, and commitment form.

Participation in the co-op can be a real benefit to any farmer whose ability to raise food is greater than their ability to sell it. For farmers who already sell all they raise at a farmer's market, or CSA- congratulations, you are already reaching your customers in the most direct way. If you raise or would like to raise, more than your present outlets can use, the co-op offers important possibilities.

Started 10 years ago, our Co-op has grown from a grouping of 5 farmers and sales of \$10,000 to our present membership of 35 and sales of \$715,000. Our distribution network reaches from Missoula to Whitefish, Helena, Butte, Bozeman, Billings, Great Falls, and is centered in Arlee, at the Common Ground farm. We are reaching retail stores, institutions, restaurants, and individuals who come together at central drop points in their communities. It is by joining together that we can provide enough volume and variety of food to enter these many markets.

Members have both rights and responsibilities. A person becomes a member after completing the membership application, an interview, and submitting a payment of \$150 for your first year. Membership dues are adjusted annually based on the farms sales through the Coop. Each member is an owner of the business, with a right to vote, to serve on the board, and to determine the Co-op's future directions. An annual meeting is held each winter, when new board members are elected, the year is reviewed, and general interests are shared.

In addition to the membership fee, the Co-op sells the member's product at a 25% margin. That 25% margin provides the operating funds for the business. We have five employees, and own a refrigerated truck for deliveries, a forklift and cooler space for storage.

The marketing and distribution that the Co-op performs is a cost based service, and any revenue that is generated beyond the operating needs will be returned to you as a member-owner, or put toward infrastructure needs, as members decide by voting.

We go through an extensive planning process each winter through which the needs of our market are identified and the growers decide what they can produce to meet those market needs.

We welcome your interest and participation. This is a business, but it is also an effort to form an effective community of people.

With Best Wishes,

Dave Prather
General Manager

WESTERN MONTANA GROWERS COOPERATIVE
PRODUCER COMMITMENT AGREEMENT

THIS AGREEMENT, made as of this _____ day of _____, 20 ____, by and between _____, herein referred to as “Producer,” and *Western Montana Growers Cooperative*, an agricultural cooperative having an office at Arlee, MT, herein referred to as “Association.”

RECITALS

- A. Association is an agricultural cooperative organized under the laws of the State of Montana.
- B. Producer is a member of the Association who produces
_____.
- C. Producer has purchased one membership certificate and paid to the Association the sum of one hundred fifty dollars (\$150.00) or the amount required based on the previous year’s patronage with the Association. This entitles Producer to all the benefits of membership in the Association for one year as long as Producer complies with the articles of incorporation and bylaws of the Association and the provisions of this agreement.

In consideration of the mutual covenants and obligations contained herein, the parties agree as follows:

Section 1. Sale of Products. Association agrees to sell and distribute and Producer agrees to produce for Association as defined by USDA standards and grown by Producer all products agreed upon from Member Product Commitment Summary Sheet or otherwise confirmed between producer and association.

This agreement is not intended by the parties to pass an absolute title to above units of product grown by Producer between dates specified, and such product shall be at the risk of Producer until delivery to and acceptance by the client.

Section 2. Payment to Producer

Association shall market Producer’s product and Producer shall accept as payment for Producer’s product a set price based on a predetermined averaged price or the current fair market price in the area for the specific product of like grade and quality. The payment option will be agreed upon at the beginning of the marketing season between the Association and the Producer.

Association shall pay the amount due Producer, less deductions authorized in Section 5 of this agreement, not more than 30 days after delivery of the product to Association or Association's prescribed location.

Section 3. Delivery. All product shall be delivered by Producer at Producer's expense at the earliest reasonable time after harvesting, or at such time as called for by Association, to Association's principal place of business or to one of Association's authorized locations as prescribed by Association. The Association will use its best efforts to locate locations within a reasonable distance from Producer's farm.

Section 4. Inspection and Grading. All marketing of products received by Association from Producer shall be based upon USDA Grade 1 or better, and Producer agrees to accept the grading established by USDA. Furthermore, all marketing of products received by Association from Producer shall be based on quality standards established with clients that may have more requirements than the USDA grading standards, and Producer agrees to accept the requirements established by the clients. Association reserves the right to not accept any products that do not meet the standards established by USDA and/or the clients.

Prior to acceptance by Association, all products that require it shall be inspected and graded by the USDA in accordance with USDA standard rules and regulations.

Section 5. Deductions. Association agrees to market for Producer the product set forth in Section 1 and to pay to Producer for said product the price set forth in Section 2, less an amount to be determined annually by the board of directors, in the sole discretion of the board, to meet the general contingencies of the business of the Association including operating and transportation expenses.

Section 6. Liens. Producer shall notify the Association of any lien on any product covered by this agreement. Producer shall obtain permission from the lien holder for Association to market such product and to retain any deductions from the payments to Producer authorized hereunder and under the articles of incorporation and bylaws of the Association. After any such deductions, Producer authorized the Association to apply the balance of the sale proceeds, or so much thereof as necessary, for payment of the lien.

Section 7. Liquidated Damages. The remedy at law would be inadequate and it would be impracticable and difficult to determine the actual damages to the Association should Producer fail to deliver the product covered by this agreement. Therefore, Producer agrees to pay to the Association for all such product delivered or disposed of by Producer, other than in accordance with the terms of this agreement, a sum equal to 100%

of the agreed purchase price of the product that should have been delivered to the Association, as liquidated damages for the breach of this agreement.

Failure to deliver the product committed herein due to ACTS OF GOD shall not constitute a breach of this agreement.

Section 8. Specific Performance. Producer agrees that in the event of a breach or threatened breach by Producer of any provisions of this marketing agreement regarding delivery of product, the Association shall be entitled to a preliminary restraining order and an injunction to prevent breach or further breach hereof and to a decree of specific performance hereof. The parties agree that this is a contract for the sale of personal property under special circumstances and conditions and that the Association may, but shall not be obligated to, go into the open markets and buy product to replace any that Producer may fail to deliver.

Section 9. Legal Costs and Expenses. If the Association brings any action whatsoever by reason of a breach or threatened breach of this agreement, Producer shall pay to the Association all court costs, costs for bonds, travel expenses and all other expenses arising out of or caused by the litigation, including reasonable attorney's fees expended or incurred by Association in such proceedings, and all such costs and expenses shall be included in the judgment.

Section 10. Termination and Renewal. This Agreement shall remain in effect so long as Recitals A, B, and C are met and a Member Product Commitment Summary Sheet or other product agreement is submitted annually. After this agreement has been in effect for one year from the date of execution, either party may choose to terminate the agreement for any reason.

Section 11. Nonconforming Agreements. Association may enter into agreements with other growers differing in terms from those contained herein, consistent with the bylaws of the Association, without invalidating this agreement, provided that Producer at Producer's request may sign a similar agreement as a substitute for this agreement.

Section 12. No Contrary Agreements. Producer warrants that Producer has not contracted to sell, market, consign, or deliver and will not contract to sell, market, consign, or deliver any product during the term of this agreement to any person, firm or corporation, contrary to this agreement.

Section 13. Forfeiture of Membership. Violation of this agreement in any material respect by Producer shall be grounds for the board of directors to terminate Producer's membership in the Association.

Section 14. Articles and Bylaws. Producer agrees to conform to and observe the articles of incorporation and bylaws of the Association now in force and as they may be amended hereafter.

Section 15. Entire Agreement. It is agreed that the articles of incorporation and the bylaws of the Association, now or hereafter in effect, and this marketing agreement constitute the entire agreement between the Association and Producer, and that there are no oral or other conditions, promises, covenants, representations, or inducements in addition to, or at variance with, any terms of this agreement.

Section 16. Governing Law. This agreement shall be governed by the laws of the State of Montana.

IN WITNESS WHEREOF, these parties have executed this agreement as of the day, month and year first above written:

Producer _____

Cooperative Chairperson _____

ATTEST:

Cooperative Secretary _____

Western Montana Growers Cooperative Statement of Cooperation

The Western Montana Growers Cooperative (WMGC) is a union of growers and producers that choose to work together to market their products in western Montana. Together, our growers are better able to increase distribution efficiency, scalability, and marketing power. The goals of WMGC are: to provide fresh, sustainably-produced farm products to our region; to access new and diverse marketing outlets for our members; and to receive a fair price for our products.

1. Members of WMGC agree not to market or sell their products either directly to Co-op customers or indirectly to distributors who compete with the Co-op by selling to Co-op customers. WMGC members agree not to sell to other producer co-ops. WMGC members who sell through the Co-op CSA agree not to operate private CSA's.

Exceptions to this agreement:

a). Members may maintain direct accounts with Co-op customers provided said accounts were established prior to their becoming Co-op members. These accounts need to be documented and submitted to the board of directors prior to being approved for membership to WMGC. An established account is defined as having sold a specific product to a customer multiple times per season on a regular basis.

b). Members may conduct direct business with Co-op customers by special arrangement with the Co-op manager or assistant manager provided it is approved of by the board of directors.

2. Members of WMGC may sell directly to businesses with which the Co-op does not currently have accounts. Members agree to disclose those business relationships on a separate disclosure form at the time they submit their commitment forms. The disclosure form will document farmers' markets attended, current CSA business, and other direct accounts including specific crops or products sold. This information will be used to better coordinate crop commitments and potential business collaboration between individual members and the Co-op, and will be made available solely to Co-op staff, unless the staff should deem it necessary to bring a potential conflict of interest to the attention of the board.
3. If there is a question of non-compliance with this agreement, a Co-op staff member or member of the board of directors will meet with the individual member to discuss the issue. The member will be informed of the manner in which they are non-compliant, and the staff or board member will work with them to define what needs to be corrected and a timeframe in which this needs to be accomplished. If an agreement cannot be reached the matter will be referred to the board. This process will be documented in a written correction agreement which is signed by both the staff or board member and the Co-op member. If the non-compliance issue is jeopardizing the Co-op, or a correction agreement is not executed, the board will issue a Disciplinary Letter, or a Discharge Letter.

A Disciplinary Letter will:

Clearly state how the member is in non-compliance, how the non-compliance can be corrected, a timeframe in which the non-compliance items must be corrected, and the consequences for not correcting the non-compliance items within the timeframe stated. These consequences will be determined by the staff and board and may include loss of crop commitments, or a higher margin charged for using Co-op services while operating in direct competition with the Co-op.

A Discharge Letter will:

Clearly state the reasons that the member is being discharged from the Co-op, reference the relevant policy, and provide a detailed description of the member's appeal rights.

The purpose of this policy is to help our membership more efficiently meet our common goals. It is intended solely for the future good of our Co-op, to ensure that we work together in cooperation to help WMGC become a thriving, dependable, sustainable business for all of its members.

I _____ (name) and all representatives of our business,
_____ (business name), agree to abide by the Western
Montana Growers Cooperative Statement of Cooperation Policy. I understand that the purpose of
this policy is to create an agreed-upon expectation for doing business as a member of the Western
Montana Growers Cooperative. I understand that a breach of this policy is grounds for dismissal
as a member of the Western Montana Growers Cooperative.

Interview Guide with Producer-Members

Producer Interview Guide

Before Interview

Check Tape

Name:

Farm Name:

Date:

Name of Interviewee:

Introduction: Thank you for agreeing to participate in this interview. As I think you know, I am working with a team of researchers from the University of Montana to learn how the Western Montana Growers' Co-op is functioning within our regional food economy. We are especially interested in learning more about the perspectives of co-op members. So, we have some questions for you about your experiences as a member of the co-op, what it involves for you, and other things like that.

Before we get started, I want to let you know that your identity as a participant in this study will remain confidential. Your name will not be specifically associated with any data in any presentations or written reports. In other words, I want you to feel free to share your opinions with us.

Once we have finished interviewing and have compiled all of our research, we will present the research at a time that is best for those involved in the Co-Op. So, if you're interested, we hope you'll watch for announcements.

If it is OK with you, I would like to record the interview. Taping ensures that your views are accurately recorded and allows me to really listen to you instead of scribbling notes the whole time.

Is that OK with you? **IF YES, TURN ON RECORDER.**

To start us off, I'd just like to get a better sense of your operation.

1. First, please tell me a little about your farm and what you produce.
2. Approximately what percent of your annual sales go to the Co-op?
3. How else do you market what you produce?

Now let's talk about what being a member of the co-op means to you.

4. When you think about the financial success of your farming business, overall, which of the following best describes how important being part of the co-op is to you:
Critically important, very important, somewhat important, not very important, not at all.
Please explain why you chose the answer you did (**PROBE for depth**).

5. We've talked a little about the financial aspects of being a co-op member. Are there other benefits of membership?

PROBE: Are there any other benefits of being a member that you haven't already mentioned?

6. As a member of the Co-op, what challenges have you experienced?

PROBE: Have there been any other challenges?

Now, let's talk a little about the governance of the co-op.

7. How well do you feel the board communicates w/ co-op members?

8. Do you regularly participate in the co-op annual meeting?

9. Do you think that the co-op needs to grow or expand? Why or Why Not?

PROBE: What do you think are the most important steps in helping the co-op grow?

10. Would you be willing to increase production to accommodate greater demand as a result of the co-op continuing to grow? Why or why not?

11. Are there opportunities or services you wish the co-op would offer its producer members that it does not currently offer?

PROBE: Any other ideas?

12. To what extent do you feel invested in the co-op's success as a cooperative business and committed to supporting it into the future?

PROBE: Could you say more about that?

13. Stepping back now from your own experience with the co-op, what do you think the role of the WMGC is in our local and regional food system?

PROBE: Would you say that its role is critically important, very important, somewhat important, or not very important?

14. Try to think about the future and imagine the co-op in 5 years. What would you like it to look like?

Thank you for all of your thoughtful responses. Is there anything else you think we should know or that we haven't already discussed?

Thank you again so much for your time and willingness to talk with us. We will keep you posted as we move forward with our research and determine when and where we end up sharing our findings.

Community Supported Agriculture (CSA) Survey Instrument and Tabulations

Western Montana Growers Cooperative CSA Survey 2012

The Western Montana Growers Cooperative appreciates your participation in the CSA this summer. To serve our CSA customers better, researchers at the University of Montana are conducting a study to learn more about your perspective. **We would appreciate you taking a few minutes to complete this brief questionnaire.**

Responses will also contribute to a University of Montana study of the role of this cooperative in the local food system. If you cannot complete this survey at this drop point, please return it in the postage-paid envelope we gave you by **November 5th** so we can still hear your feedback. Thank you for your time!

- 1. Where do you pick up your share?** St. Ignatius St. Pat's (Missoula) Polson
 Trailhead (Missoula) University area Ronan Arlee Charlo Bitterroot Valley

- 2. How many years have you belonged to the Western Montana Growers Co-op CSA?**
 1 2 3 4 5

- 3. Please indicate how important the following are to you as a CSA member.**

	Very Important	Somewhat Important	Not Important	Don't know
a. I know the people who grow the vegetables I eat.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b. The vegetables I feed my children are healthy.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c. The vegetables are extremely fresh.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d. I am supporting local farming.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e. The vegetables taste so good.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f. I am doing something that is good for my own health.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g. I am contributing to environmentally friendly agriculture.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
h. I am able to order extra items online (eggs, meat, cheese).	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

****Please be sure to fill out the back side****

4. Think about your experience of belonging to the Western Montana Growers Coop CSA. Please indicate the degree to which each of the following is true for you.

	Very True	Somewhat True	Not True	Don't know
a. The CSA shares were a good value for my money.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b. I have learned how to prepare and eat new vegetables.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c. I am happy with the variety of produce provided throughout the season.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d. The length of the season was appropriate.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e. The CSA coordinator was responsive to my concerns and questions.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f. The drop point was convenient for me.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g. I have learned how to prepare and eat new vegetables.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
h. I have learned that more vegetables can be grown in our area than I have realized.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
i. I enjoy eating vegetables more than I used to.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
j. My desire for high quality vegetables has increased.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
k. My awareness of and attention to the larger food system has increased.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
l. I feel a sense of trust in the co-op and the food I get from it.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
m. I feel that I am supporting my local economy.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Please provide a short response to the following questions:

5. My CSA share fed: 1-2 3-4 5-6 6-7 7+ people.

6. Did the quantity of the produce meet your weekly produce needs? Or did you need to visit a grocery store for supplemental items?

7. What items would you like to see more of?

A. _____ B. _____ C. _____

8. What items would you like to see less of?

A. _____ B. _____ C. _____

9. Are you interested in being a customer next year?

Yes No Why or why not? _____

10. Your age: _____

11. Are you: Female Male

12. What level of schooling have you completed?

Less than high school High school College Graduate degree

13. Would you like more information available on:

- The farmers who grow for the CSA
- the Western Montana Growers Cooperative
- other local food issues, such as:

Thank you for filling out this survey!

If mailing the survey, please return it by November 5 to:

Western Montana Growers Cooperative CSA Survey 2012

Kim Gilchrist, Arza Hammond, Morgen Hartford, Katie LeBlanc, Rachel Mockler
University of Montana

The survey was administered at the end of the 2012 CSA season. The following presents simple tabulations of the results. These tabulations are based on 112 completed surveys (overall response rate was 74%). The **N** column indicates the number of people who gave each response to a given item, and the **%** column indicates the corresponding percentage of people who gave that response (based on the total number of people giving valid responses to the item, and thus omitting people who skipped the item or answered 'don't know' or 'not applicable'.)

Appendix G

Interview Guide for Wholesale and Institutional Buyers

Buyers Interview Guide

Rachel, Kim, Arza, Katie, Morgen

Instructions to interviewer:

Introduction. Thank you for agreeing to participate in this interview. I'm part of a research team studying the Western Montana Growers Cooperative.

We will present our research to the Grower's Cooperative this winter and we will provide a copy of our report to all of our participants as well.

If it is OK with you, I would like to record this interview. This assures that your views are accurately recorded.

Is that OK with you? IF YES, BEGIN RECORDING.

Relationships. I would like to begin by talking about your relationship with the cooperative.

1) How long have you been buying product from the co-op?

Probe: How did this relationship begin?

Who contacted who?

Tell me more, how did that first interaction go?

2) What factors influence your purchasing decisions regarding buying?

Probe: Do you think that providing local food from the grower's co-op attracts more customers to your store? Why or why not?

Buyer Experiences Now I would like to discuss your experiences buying from the co-op.

3) Walk me through the ordering and delivery process for your store.

Probe: How does this process work for you?

4) Do you consistently have access to the quantity of product that you want?

Follow-up: How does it affect your business when you can't order what you want?

5) How does the quality of the co-op's products compare to products from your other distributors?

Follow-up: Given the quality, are you satisfied with the prices you pay for these products?

6) Do you process any of the products that you purchase from the co-op?

Probe: Would you buy (more) processed goods from them if they were available?

7) Are there any products you'd like to purchase from the co-op but are unable to?

Follow-up: Would would need to happen for you to start purchasing these from WMGC?

8) I understand that WMGC meets with their customers during the winter. How helpful are these meetings from your perspective?

Probe: Are there ways these meetings could be more helpful?

Marketing. Now let's discuss marketing strategies for the Co-op products.

9) What is your perspective on how the co-op markets itself?

Follow-up: What suggestions do you have for the co-op when it comes to marketing?

10) What kinds of display materials does the co-op provide you with for use at point-of-purchase in the store, if any?

Probe: Are these materials adequate?

Follow-up: Do you use any of your own materials to advertise the co-op?

11) We understand that the co-op typically provides products that are either certified organic, carry the Homegrown (local) label, or both. Please tell us a little how this affects you as a customer.

Follow-up: Do you think organic has meaning in your marketplace?

Follow-up: Similarly, do you think Homegrown has meaning to your customers and in your market?

Probe: Would you like to see more of a Homegrown presence?

Benefits and challenges. I would like to finish by discussing some of the benefits and challenges you see in working with the co-op.

12) Are there any challenges you have experienced that we haven't talked about already?

Probe: What could they do better?

13) What are the benefits you have experienced from buying from the co-op?

Probe: Are there any unexpected benefits? What are they?

14) What do you like most about working with them?

Thank you for your time today. I will be in touch to let you know when to expect the final results of our report.

Appendix H

Co-op Curtsey

Based on his observations, student researcher, Taylor Lyon, composed this song. He played guitar and sang it for our research team at our final group gathering.

Co-op Curtsey

Composed by Taylor Lyon December 2012

1st verse:

G C G
Well it's 6 am and I'm gone again off to make my pay

D
Got a boss to please and a load to haul got me some bills to pay

G C
And I got some pride that I just caint hide that I wear all over my face

G D G
And I do what I do because I want to thats the WMGC way

2nd verse:

We're a little renegade a little out of the way a little scrappy but that's just fine
Cause we pick it fresh and we pick the best and get it to you on time
Well our labels suck and fork lift too and our boxes just get in the way
Oh but we don't mind cause our golden goose is that good ole CSA

Chorus

3rd verse:

Well we got a friend who lends a helping hand to help us down the road
On an east bound truck with some empty space he helps us carry our load
And a philanthropist who shacks us up and gives us pretty cheap rent
So the money comin in is money in the bank instead of money spent

Chorus/4th verse

Chorus:

D C G D C G

Hats off to you for all that you do

D C

Well yer food taste great and your service is fine

D C

When you gonna start selling whiskey and wine?

D C G

Hats off to you!

**Joint Written Testimony of El Pasoans Fighting Hunger Food Bank and DoorDash
Before the Committee on Rules, U.S. House of Representatives
Ending Hunger in America: Food Insecurity in Rural America**

Dear Chairman McGovern, Ranking Member Cole, and Members of the House Rules Committee:

Thank you for the opportunity to submit testimony on the critical issue of ending hunger in America. Our testimony details the innovative partnership between El Pasoans Fighting Hunger and DoorDash that is powering home food delivery for those in need in the Texas borderland and the important role that local delivery can play in ensuring that no one in our country goes hungry.

El Pasoans Fighting Hunger (EPFH) is El Paso's only food bank and a member of Feeding America, the nation's largest hunger relief network. EPFH's mission is to combat the hunger crisis in our region by strategically procuring and distributing nutritious food through community partners. The food bank is the distribution center for over 132 partner pantries across the borderland region and collaborative hub for hunger initiatives that assists in SNAP applications and nutrition education. EPFH also distributes healthy and nutritious food to 543 client choice mobile pantries, which provide food to underserved/unserved communities.

EPFH currently serves an estimated 200,000 food insecure people. And, in 2020, the food bank distributed 139.7 million pounds of food -- which represents a 400% increase in food distributed from the previous year and makes EPFH the third-largest food bank in the nation in terms of distribution despite being the youngest food bank in the country.

DoorDash is a technology company that connects consumers with their favorite local and national businesses in more than 7,000 cities across the United States, Canada, Australia and Japan. Launched by DoorDash in 2018, Project DASH uses the DoorDash local delivery platform to tackle issues like food access and food waste. Project DASH enables government and nonprofit partners to request pickup and delivery fulfilled by Dashers -- the couriers who use the platform -- to food insecure families and other clients in the community. To date, Project DASH has fulfilled more than one million deliveries in over 900 localities across the U.S. and Canada, with approximately 85% of deliveries being made in communities of color. We estimate that these deliveries equate to more than 21 million individual meals for those in need.

Project DASH is DoorDash's signature social impact program. The company has dedicated a team of five full-time operators to manage and expand the program, who partner closely with cross-functional teams focused on external partnerships, product, delivery quality and communications. DoorDash is proud to have contributed more than \$4 million in in-kind deliveries through Project DASH to date.

Our Partnership to Serve Neighbors in Need Throughout the Borderland

The COVID-19 pandemic drastically increased the need for food assistance in the Texas borderland and across the country. In addition to the growing need, the unique challenges of the pandemic required El Pasoans Fighting Hunger and other food banks to find ways to safely get meals and other essentials to clients who are highly-vulnerable, ill, or in quarantine due to a COVID-19 exposure. The partnership between EPFH and Project DASH -- which began piloting deliveries in March 2021 as part of the food bank's home delivery program -- was the innovative solution that met these challenges.

Since launching, Dashers have fulfilled over 50,000 deliveries, providing approximately 750,000 meals to vulnerable community members, including seniors, individuals with disabilities, and veterans. The partnership has served up to 2,100 food bank households during some weeks.

Our Vision: Local Delivery As A Tool To End Hunger

While the partnership between El Pasoans Fighting Hunger and Project DASH has allowed the food bank to respond to the immediate needs of the COVID-19 pandemic, it has also demonstrated that local delivery is a transformational tool in the fight to end hunger. Delivery can address many of the barriers to access faced by vulnerable families -- including barriers that were present before the pandemic and will persist after the pandemic recedes -- while simultaneously enhancing client convenience and food bank operations.

Breaking Down Barriers to Access

In absence of local delivery, those in need are often required to travel to a food bank or food pantry to obtain food assistance. This means that lack of reliable transportation, a disability, or scheduling challenges created by work or childcare commitments can become insurmountable barriers to access for many families. Local delivery takes these barriers out of the equation by ensuring that food travels to families in need -- not the other way around.

As an example of the impact that this partnership has had for EPFH clients, we would like to tell you a little about Martina: Martina is in her late sixties and lives in a rural town located on the U.S.-Mexico border. When she reached out to EPFH, she shared that she had recently lost her husband, which significantly impacted her financially. She was also recovering from a set of knee surgeries. Martina didn't know how she would be able to get food because of the financial hardship she was experiencing coupled with her age and lack of mobility. She worried she might go hungry. Martina asked food bank staff if there was any service that could help her get food without requiring her to leave home. EPFH signed her up in the food bank's home delivery program powered by the partnership with Project DASH. She now receives food assistance in a way that accommodates her circumstance, including her limited mobility.

Even after the pandemic is over, the barriers that clients like Martina face will remain and, as a result, the need for local delivery services will continue.

Enhancing Client Convenience and Dignity

Local delivery facilitated by the partnership not only addresses barriers but also improves the client experience. Many Americans now order groceries or food for home delivery. A struggling family should not be precluded from having that convenience merely because of where the food is coming from -- in fact, families facing the challenges of economic hardship and hunger need the convenience more than anyone else. By better aligning the client experience with how other families receive their food, home delivery also reduces the likelihood that clients will endure the unfortunate stigma that many feel when accessing food assistance and other social programs.

Driving Efficiencies in Operations and Service

The partnership between EPFH and Project DASH has made facilitating home delivery to clients simple. Once EPFH identifies a client in need, the food bank can use DoorDash's existing local delivery network to easily schedule delivery of food to the client's home the same way that many restaurants or other merchants use the platform to connect with their customers. Deliveries are then fulfilled by DoorDash's community of Dashers, who are compensated for each delivery they make. Because of this partnership, there is no need for EPFH to have its own delivery vehicles or dedicate staff time to delivery services -- this drives operational efficiencies and allows EPFH to focus more resources on client assistance, food procurement, and other important services that advance its core mission.

A Policy Landscape to Support Local Delivery

Local delivery is an innovative solution to end hunger, but one that needs to be accompanied by the right public policies. We hope that any legislative or regulatory package following the work of this Committee or the proposed White House Conference on Hunger, Food, and Nutrition will acknowledge the power of local delivery and provide a policy landscape that empowers food banks to scale home delivery service to meet the needs in their community.

Ensuring That Our Nation's Food Banks Have Adequate Resources

Local delivery, like any other service, requires food banks and food pantries to be sufficiently resourced. Recognizing the sudden, heightened need during the pandemic, increased government aid was made available to ensure that food banks could continue to serve their clients. Food banks were able to expand their capacity through robust funding for services, hiring additional staff, and the surge in volunteerism. Now, EPFH and food banks across the country face substantial decreases in both funding and personnel. For EPFH, declining resources has meant evaluating whether to close as many as three of its five primary food pantries, end its homeless feeding program, and reduce its home delivery program by 50%.

In order to do their part in closing the meal gap and ending hunger, food banks need robust resources from the public and private sector. Increased aid during the pandemic demonstrated what was possible: standing up innovative models to reach vulnerable families -- like the partnership between EPFH and Project DASH -- and meeting unprecedented levels of need. Continued, increased funding will help food banks hire or retain essential staff, make infrastructure investments, conduct client outreach, and establish and enhance programs like local delivery that can ensure that every family has access to the food they need. Robust resources are particularly important in order to expand services to meet the food and nutrition needs of those in rural, hard-to-reach communities.

Further Assess the Power of Local Delivery Through Demonstration Pilots

Local delivery should be considered as Congress weighs authorizing and funding demonstration pilots to evaluate the potential of alternative approaches to food assistance. Doing so would provide opportunities for new food banks to initiate local delivery for their clients and for food banks to expand the scope of existing delivery programs to new populations or new communities. Demonstration pilots would also allow the federal government to better evaluate the positive impact of local delivery on food insecure families and how delivery could be implemented as part of a national anti-hunger strategy.

* * *

We can end hunger in America, but it will require innovative solutions in order to ensure that food reaches those most in need. The partnership between El Pasoans Fighting Hunger and Project DASH to serve struggling families in the Texas borderland has demonstrated the power of local delivery in overcoming some of the steepest barriers to food access. As Congress and the Administration look for solutions to this critical issue, we encourage consideration of the role local delivery can play.

Thank you for the opportunity to submit this written testimony. El Pasoans Fighting Hunger and DoorDash stand ready to work with the Committee, find solutions, and push for action during this truly all-hands-on-deck moment to end hunger.

The Honorable James McGovern
Chairman
House Committee on Rules
H-312 The Capitol
Washington, D.C. 20515

The Honorable Tom Cole
Ranking Member
House Committee on Rules
H-152 The Capitol
Washington, D.C. 20515

RE: National Grocers Association Statement for the Record
Ending Hunger in America: Food Insecurity in Rural America

The National Grocers Association (NGA) is the voice in Washington, D.C. for America's 21,500 independent community grocers and the wholesalers that service them. Independent grocers account for 33 percent of all grocery sales and more than 1 million American jobs. Our members are at the heart of local communities throughout the country and play an important role in feeding our nation. NGA thanks Chairman McGovern, Ranking Member Cole, and Members of the House Committee on Rules for giving much needed attention to the issue of food insecurity in America.

From the customers they see each day to the local producers who fill their shelves, the country's independent grocers offer insights into Main Streets and towns that are truly unique. Independents play an outsized role in food access for rural communities across the country; our member retailers serve as one of the few options for families to access fresh fruits and vegetables and other grocery staples. According to the USDA Economic Research Service, rural areas – including areas with a higher share of low-income households – tend to have more independent food retailers and fewer chain stores.¹ The same study found that stores with a higher share of Supplement Nutrition Assistance Program (SNAP) redemptions are more likely to be independently owned.² Furthermore, rural Americans are disproportionately represented in nationwide food insecurity statistics. According to Feeding America, sixty-three percent of counties in the United States are composed of rural communities, and yet these communities represent nearly eighty-seven percent of the counties with the highest rates of overall food

¹ <https://www.ers.usda.gov/webdocs/publications/85783/err-240.pdf>

² Id.

insecurity.³ Taken together, the data illustrates the crucial role independent grocers play in providing food access to rural populations who face some of the greatest challenges to addressing food insecurity nationwide.

The Covid-19 pandemic and the current supply chain crisis has brought into focus the tenuous situation that many community grocers face in today's climate. Our members who serve rural communities are not only having difficulties keeping their shelves stocked but are struggling to stay open in the face of ever-growing pressures from national big-box and dollar store chains who use anticompetitive practices to drive local grocers out of business.

While shortages and limited availability of critical inputs and food supplies affects everyone, the impact of these shortages are felt disproportionately by independent grocers and the rural communities they serve. Inconsistent distribution and apparent shortages of consumer goods has made it more difficult for customers of independent grocery stores to obtain high-demand products because our members compete against dominant players with immense economic power that can wield tremendous influence over their suppliers.

In addition to supply inequities, independent grocers are experiencing unprecedented levels of price discrimination. Our largest competitors use their influence to maintain favorable wholesale pricing as independents experience a retreat of promotional trade spending, a critical marketing tool that allows independent grocers to compete on price.

The effect of these supply and pricing issues is that independents simply cannot compete on a level playing field. If independent grocers are unable to stock necessary food staples, or cannot remain competitive on price, the rural communities they once served will take their business to a dollar store or big-box chain. Unfortunately, however, these national retailers are either farther away from the communities who need them most, or simply do not offer the level of produce and other fresh food items that are necessary to maintain a nutritious diet. Rural and low-income consumers are already forced to travel longer distances to find the products they need, but if their community grocer goes out of business, that 10-to-20-mile trip to the grocery store now becomes a 30-to-50-mile excursion to a big box retailer or dollar store.

Independent grocers and their rural customers are also bearing the greater burden of food price inflation. Historically, dominant chains have been able to resist inflationary cost increases thanks to their uneven bargaining leverage over suppliers. As a result, suppliers are forced to impose higher costs onto their smaller retail customers who have less clout in the market. In turn, independents are forced to raise their prices to stay profitable, hastening the likelihood of their

³ <https://www.feedingamerica.org/hunger-in-america/rural-hunger-facts>

community choosing to travel farther to a national competitor. In severe access-deprived areas, rural consumers who lack grocery alternatives – or means of transportation – are forced to stretch their food budgets even further as inflationary pressures and higher prices mean less food on the table.

There are various factors that are making it difficult for independent grocers to stay in business and continue serving rural communities. As a result, it is these low-income and low-access populations who suffer the most. But the impact of a rural independent grocery store closure is not just felt in terms of food access. In many small towns, the local grocery store supports the community as a major employer and through various other outreach initiatives. Whether serving as a partner to help eligible beneficiaries apply and access information on nutrition programs or donating to local food banks and spearheading food drives, independents serve as a bulwark of community resilience in the best and worst of times. When local grocery stores disappear from Main Streets in rural communities, it affects far more than just the customers who can no longer buy food there.

Antitrust laws that prohibit exclusionary conduct and price discrimination have not been enforced by regulators in a generation. It is nearly impossible for aggrieved private parties to bring cases in court because the burden of proof is all but impossible to overcome. Therefore, dominant firms can use their size and influence to tilt the playing field in their favor without fear of consequence.

Antitrust regulators have the power to deter harmful anticompetitive conduct by enforcing antitrust laws like Section 2 of the Sherman Act and the Robinson-Patman Act. Agencies must be funded by Congress with the resources necessary to police anticompetitive conduct in the grocery sector. Additionally, Congress should consider updating the antitrust laws to reflect the modern competitive landscape in the grocery industry.

As Congress considers antitrust enforcement in Big Tech, Americans' food supply should be part of that conversation. What we cook is at least as important as what we click. The laws written to prevent this conduct can no longer be ignored and must be enforced to protect local stores, consumer access, and Americans' health.

With a level playing field, independent stores can stay open, and customers can choose where to buy their groceries. Families living in rural and urban areas can have the reliable access to staples they need in good times and bad. A vibrant marketplace – where small, medium, and big businesses compete to offer better prices, higher quality, and more locations – benefits all Americans.

Rural Grocery Stores are Key to Supporting Rural Community Health

**Statement of
Rial Carver
Program Leader and Extension Specialist
Rural Grocery Initiative**

December 8, 2021

Rural grocery stores are vital to rural communities

Across the country, rural communities face a multitude of challenges: declining and aging population, school consolidation, poor access to healthcare and broadband, and the list goes on.¹ Among those challenges is the all-too familiar story when a rural, independent grocery store shuts its doors the community loses out on yet another essential resource.²

In 2007, the Center for Engagement and Community Development at Kansas State University was founded to connect Kansas residents with resources generated by the university. A series of listening sessions were conducted to identify the critical needs of Kansans, and one theme that arose was a deep concern for the viability of their community's grocery store. As a result, the Rural Grocery Initiative was founded with the mission of sustaining locally-owned rural grocery stores in order to enhance community vitality and improve access to healthy foods by identifying, developing, and sharing resources that support grocers and rural communities.

Rural grocery stores provide key benefits

The vitality of a rural community is directly linked to the viability of its local grocery store. Rural grocery stores play three key roles in their communities: they boost local economies, they support community health, and they promote community vibrancy.

Economic Development

A survey of rural grocery stores in Kansas communities of 2,500 people and below showed that, on average, the rural grocery store contributes \$644,000 to the local economy annually.³ This stems from the rural grocery store's contribution to the local tax base in sales and property tax dollars.⁴ The average rural grocery store's payroll includes 17 employees, comprised of a mixture of full and part-time positions.⁵ Rural grocers compliment other businesses in the town: they are top customers of the local water and electric utility, and when a grocery store closes, other local businesses are negatively affected.⁶ Additionally, independent businesses, including rural grocery stores, return more than three times as much money per dollar of sales to the community as compared to their chain competitors. The independent retailer's greater impact on the local community can be attributed to local employment, purchasing items locally for sale at the store, contracting services from local companies, and donating to community causes.⁷

Community Health

Rural grocery stores play a critical role in their community's health. Rural communities experience higher rates of obesity and other chronic diseases, and research shows that improving access to retail outlets with healthy food options is an effective strategy for combatting chronic disease.⁸ Rural grocery stores also provide a greater variety of healthy foods at lower cost than their convenience store counterparts.⁹ Additionally, rural grocery stores offer access points for federally funded nutrition programs like the Supplemental Nutrition Assistance Program (SNAP) and Women, Infants and Children (WIC) as well as nutrition incentive programs that double SNAP dollars for eligible recipients.¹⁰

Cultural Vibrancy

Rural grocery stores are anchor institutions. They serve as community hubs and places where social capital is built.¹¹ The presence of a rural grocery store can be a critical factor in quality of life for a community and in resident retention and recruitment.¹²

The grocery industry is tough and it's even tougher for independent and rural grocers

Nationally, the grocery industry sees profit margins between 1% and 3%.¹³ For every \$100 in sales, a grocer is lucky to hold on to \$3 after covering inventory and operational costs like utilities and staffing. In addition to low profit margins, the grocery industry has continued to consolidate over the past three decades. The independent grocer has lost more and more of its share in the grocery industry, making it harder to compete. With their purchasing power, big box retailers are able to negotiate huge discounts and favorable terms from suppliers. As a result, customers are drawn to lower prices offered by chain competitors and away from rural and independent grocery stores. Single location stores, a category of store commonly found in rural areas, have lower average sales than chain stores.¹⁴

Operating costs are also difficult to control for rural grocers, as many stores are located in aging buildings. According to the latest Kansas Rural Grocery Survey, conducted by the Rural Grocery Initiative, 78% of rural grocery stores are located in buildings that are more than 30 years old and the majority of equipment and infrastructure in these buildings (refrigeration and HVAC) are over ten years old.¹⁵ Renovating grocery stores to support efficient operations is of great importance for grocery stores to remain viable and is difficult to accommodate without external support due to aforementioned low profit margins.

¹³ Johnson, "The Industry Standard for Gross Margin in Groceries."

¹⁴ Alex et al., "The Food Retail Landscape Across Rural America"; Zeballos and Sinclair, "USDA ERS - Retail Trends."

¹⁵ Ramirez et al., "Rural Grocery Survey Preliminary Findings."

Tracking of retailers during the period between 1983 and 2021 shows that more than 4,200 grocery stores are estimated to have closed across the country¹⁶ and many of these closures have affected rural areas. Nationally, the share of grocery stores in rural areas has decreased by 15% between 1990 and 2015.¹⁷ Between 2008 and 2018, the Rural Grocery Initiative found that one in five rural grocery stores in Kansas shut their doors for good.¹⁸

In conjunction with this trend of store closures, an enormous sea change in rural grocery ownership is on the horizon. According to a recent study conducted by the Rural Grocery Initiative, rural grocers in Kansas are aging. Many have worked in the grocery industry for decades, and 40% plan to retire within the next five to ten years. Overwhelmingly, 81% of Kansas rural grocers do not have a plan in place to transition ownership of their grocery store.¹⁹ Rural communities will lose out on the benefits of rural grocery stores if rural grocers cannot find a successor.

Rural grocery stores need local supports and national solutions

Rural grocery stores need help if they are to continue playing the vital role of driving local economics, providing access to nutritious and affordable food, and promoting community vitality. While some solutions are already underway, additional support is needed to level the playing field.

Local Solutions

Fortunately, rural communities are flexing their creative muscles to develop innovative solutions to keep healthy food options in town. Just in Kansas, there are numerous examples of cooperative and non-profit rural grocery stores. As opposed to a single owner, some stores are run by municipalities and schools, while others leverage public-private partnerships to stay in business. These emerging models of shared ownership are reliant on strong partnerships, creative thinking, and community input. None of these models are set in stone, but components of each can be combined to create a new, unique model that fits the needs of individual communities.²⁰

State and National Supports

Many existing federal programs have been utilized to support rural grocery store construction, renovations and owner transitions in Kansas. USDA Rural Development's Rural Economic Loan and Grant (RED-L/G) program has supported several communities that have lost their grocery store and needed to build anew. Perhaps one of the greatest success stories has been the work of the Kansas Energy Program in supporting small business energy assessments and applications to the USDA Rural Energy for America Program (REAP). USDA REAP has funded energy improvements at 30 rural Kansas grocery stores since 2016, equating to \$550,000 in grant

¹⁹ Ramirez et al., "Rural Grocery Survey Preliminary Findings."

²⁰ Brinkley et al., "'If You Build It with Them, They Will Come'"; Rural Grocery Initiative, "Rural Grocery Ownership Models."

funding that lowers utility costs and allows businesses to invest in other aspects of their business.²¹

Healthy Food Financing Initiatives have also gained traction over the past few years.²² Such initiatives provide financing to support the development and/or long-term sustainability of healthy food retail outlets. They operate at various levels of government in states across the country. In Kansas, the Kansas Healthy Food Initiative is a public-private partnership between the Kansas Health Foundation, the Rural Grocery Initiative, NetWork Kansas, IFF and The Food Trust. An economic impact analysis of the program showed that every \$1 of initial healthy food access investment contributed to another \$1.11 in economic activity across the Kansas economy²³. At the national level, USDA Rural Development operates America's Healthy Food Financing Initiative, which was established in the 2014 Farm Bill. Through its Targeted Small Grants Program, funding is available to support food retail projects located in underserved and low-income communities across the country.²⁴

Conclusion

Home to 60 million Americans, scores of families have, for generations, called rural America home.²⁵ It is a quintessential attribute of American culture and history that has left an indelible mark across the country. Yet, rural communities face a multitude of challenges, one of them being the continued decline of rural grocery stores. As essential infrastructure, rural grocery stores are vital to sustaining the health and well-being of rural America for generations to come.

U.S. HOUSE OF REPRESENTATIVES
COMMITTEE ON RULES
EST. 1789 | JAMES P. McGOVERN (MA-2), CHAIRMAN

U.S. HOUSE OF REPRESENTATIVES

Committee on Rules

**ROUNDTABLE: “Ending Hunger in America: Examining Indigenous
Nutrition and Food Systems”**

February 18, 2022

OPENING STATEMENT

Thank you, Chairman McGovern, for hosting this roundtable on *Indigenous Nutrition and Food Systems* as part of your Ending Hunger in America series.

On the House Committee on Natural Resources, we have talked about the impacts of climate change and highlighted traditional ecological knowledge. By listening to Indigenous Peoples, we can begin discussions around climate change and ensuring the protection of the environment.

Similarly, this idea applies to Indigenous nutrition and food systems. Our global society can promote the idea that globalization is the key to creating sustainable agriculture when it's local or Indigenous knowledge that will assist us as the climate changes.

Drastic changes in temperature and water levels have left it difficult for some tribes to continue some agricultural practices.

Food insecurity has been linked to chronic health conditions, including diabetes, kidney disease, cancer, coronary heart disease, stroke, and lung disease. This is especially true with American Indians, Alaska Natives, and Native Hawaiians, who already experience these health conditions disproportionately high.

Let's not forget we are not the first cultivators in this country. Before colonial contact, Indigenous Peoples lived off the land and established their food systems.

Although many foods have been overwhelmed by a global economy, many tribes continue to cultivate the land and grow food for their communities.

As Members of Congress, it's time that we listen to Indigenous peoples – the original cultivators of this land. We must understand that sustainable food creates a strong community.

I look forward to listening to our panelists and hope to work with Members to ensure that Indigenous nutrition and food systems remain top of mind when creating robust legislation to address the problems we may hear today.

Thank you to Chair McGovern for hosting this one of a kind roundtable and addressing this important issue.

Rules Committee and Natural Resources Committee Roundtable:
Ending Hunger in America: Examining Indigenous Nutrition and Food Systems.
February 18, 2022

OPENING STATEMENT

Good afternoon. Thank you to the Rules Committee and Chair McGovern for hosting today's roundtable.

You can't think of a New Mexico traditional meal, without giving thanks to the three sisters of corn, squash and beans -supplemented by the sisters fiery cousin chile, which is also indigenous to the Americas. Our tamales, enchiladas, and calabacitas reflect the gifts we were given by those Indigenous to these beautiful lands we call home.

Yet, in return, the Europeans who made contact caused much harm, from slaughtering the bison so as to starve the plains Indians into submission to taking lands upon which our indigenous peoples depended for hunting, fishing and cultivating.

Now, Native Americans have some of the highest rates of food insecurity, and highest rates of diabetes.

Yet, we see the resurgence of healthy diet as coming directly from our tribal leaders.

I've heard often that there is no word for hunger or poverty in Keres or other indigenous languages, because no one would be left hungry or without what they need to survive.

We need to get back to that view

In my district, the Red Willow Center is working to reclaim the agricultural heritage of Taos Pueblo and restore its traditional food systems.

Led by Tiana Suazo, Red Willow grows organic produce for the community. The farm brings whole, nutritious foods like blue corn, beans, squash, wild asparagus, and carrots to the local farmers market every week where the produce is sold at a discounted price to tribal members. Anything left over is delivered to elders along with pamphlets explaining nutrition content and simple recipes.

Red Willow Center also hosts a youth program for native children to learn about local agriculture and nutrition.

Local physicians have noted improved health ever since Tiana increased programs during the pandemic, especially in the elders receiving food packages.

Additionally, last fall the United States Secretary of Agriculture Tom Vilsack visited my district to tour the food distribution center in Rio Rancho. He also visited the Ohkay Owingeh Pueblo's water treatment facility.

Secretary Vilsack spoke with community members about the importance of targeting our most vulnerable families to make sure they have access to nutrition programs. He highlighted the need for children to be well fed at school so they are ready to learn. I agree.

Rules Committee and Natural Resources Committee Roundtable:
Ending Hunger in America: Examining Indigenous Nutrition and Food Systems.
February 18, 2022

Issues like this are why I will soon reintroduce the Tribal Nutrition Improvement Act to bring increased access and tribal sovereignty to school nutrition programs.

To honor the federal trust responsibility, Indigenous communities must have federal resources to promote nutrition and agriculture to their people. And we must always make sure that Tribes themselves lead the efforts to improve tribal nutrition.

I am pleased to see our panelists virtually today. I look forward to listening to your stories so that we may continue to work with the Biden administration to address the problems you face.

Hoopa Valley Tribe Food Security Efforts

Background

Background

The Hoopa Valley Tribe is located in the far Northern portion of California roughly 7 hours North of Sacramento and two hours South of Oregon. The Hoopa Valley is rich in traditional foods and natural resources that have sustained the people of the valley since time immemorial.

Hoopa tribal people have been a secure food nation for thousands of years pre-contact. Since contact and the establishment of the Hoopa Treaty in 1868, the Hoopa people have seen declines in food sovereignty.

The resiliency of the Hoopa people in the past few decades has awoken the need to address food insecurities on the Hoopa Valley Indian Reservation. The Hoopa Valley Tribe's nonprofit organization, the Klamath Trinity Resource Conservation District(KTRCD), has initiated agricultural and food security efforts in Hoopa since its formation in 2007. This organization has worked with the USDA agency to support and provide technical assistance for tribal producers.

The KTRCD has been able to work alongside USDA NRCS California to create a million-dollar set aside for tribes. This set aside has benefitted many tribes throughout California and has initiated Statewide tribal advisory council meetings semi-annually with the NRCS State conservationist. These meetings have created tribal traditional ecological practices that tribes are using to provide resources for managing their natural resources on their tribal lands. Tribes in California have used these practices for tens of thousands of years. These efforts have been a guide for NRCS nationwide, and the KTRCD partnership with NRCS is highlighted as to how to effectively work with tribes throughout USDA.

The KTRCD works with the Hoopa Valley Tribe's education programs to get youth involved in food security projects and the Klamath Trinity Joint Unified School District. These pre-K and K12 projects consist of seeding plants, planting, conservation practices, harvesting, and prepping and preserving the foods grown. The KTRCD has overseen the Hoopa community garden and used it as a demonstration garden.

The KTRCD also works with tribal producers to develop conservation planning on their property and provide resources for purchasing seeds, starts, irrigation supplies, and more. These producers are provided information if they want to seek out USDA programs such as EQIP NRCS and FSA Micro Loan programs. The KTRCD listens to the needs a vision of tribal producers on their lands.

Also, the KTRCD provides nutrition and food preservation classes to the Hoopa community. These classes teach how to use foods grown in Hoopa year-round and preserve these seasonal foods. The KTRCD also provides traditional foods classes that teach community members how to properly and sustainably harvest traditional foods.

Finally, the KTRCD has a local farmers market that provides an avenue for tribal producers and value-added producers to sell their products to the Hoopa community. The market starts beginning of June and ends at the end of October yearly. The KTRCD successfully obtained a USDA RD Community Facilities grant and purchased tables, chairs, and pop-ups. These items help producers and have been of great value to the community. The KTRCD also can accept

EBT benefits. The KTRCD was able to secure this through USDA FNS and provide a market match and a voucher for tribal elders and SSI/SSID recipients.

Empowering Tribes in Technical Assistance, Outreach, and Capacity Building

- Background
 - The census definition of a farm is any place from which \$1,000 or more of agricultural products were produced and sold, or normally would have been sold, during the census year. The definition has changed nine times since it was established in 1850. **This ruling has exited out many tribal producers, tribal traditional food gatherers, and tribal subsistence farmers.**
 - USDA dates back to 1862, a period that includes federal government sanctioned removal and Homestead Acts transferring Tribal lands to white settlers.
 - Although Native people have been farming this land since time immemorial, Tribal governments and producers were never envisioned as stakeholders in the Department.
 - For example, the average Native farm size is 978 acres and more than twice the average size of white farms (431 acres). However, white farms are more than 3 times as profitable as Native farms despite being less than half the size (total value of production for Native farms is \$58,885 compared to \$193,132 for white farms).
 - This can be attributed to the historical and systemic lack of access to capital, lack of access to USDA programs, and lack of access to technical assistance. These concerns also align with what Tribal producers are saying during the pandemic.
- To address these issues, USDA must not only take steps to address barriers within the building but also empower Tribal governments and Tribal organizations.
- Issues with Rural Development
 - USDA RD offers many grant and loan programs to support rural communities, however Indian Country remains underserved.
 - Tribes often lack large scale planning resources but are in critical need of the resources USDA RD offers.
 - Tribal Nations encounter difficulty accessing credit through lending institutions which currently have very little incentive to extend credit and capital services onto tribal lands.
 - Implement the Tribal Technical Assistance Office at Rural Development provisions from the 2018 Farm Bill to support Tribes and Tribal entities have access to the agency Rural Development (RD) programs as well as provide need support and connection with partner organizations on training and guidance within RD on Tribal business structures and entities to clear up any misunderstandings of ineligibility.
 - Rural Development community facilities grants are a benefit to agriculture economic development in tribal communities. The problems faced by tribes is the reimbursement rate. It is a barrier for tribes to purchase all items of the grant upfront and wait for reimbursement. USDA RD could alleviate this barrier, if they would allow for partial reimbursements.
- FSA Credit Access
 - FSA needs to address cultural sensitivities when dealing with tribal members. Often tribal producers enter FSA office only to be told they would not qualify from the start. FSA employees need to be trained to understand that a tribal producer

walking into a federal agency is a cultural barrier and there are cultural traumas tied to these encounters.

- FSA field office are geographically inaccessible to tribal producers. The nearest distances to office are barriers to rural tribal producers. USDA FSA could assist tribal producers remotely.
- NRCS and Conservation
 - To support a focus on healthy and productive agriculture lands, both DOI and USDA-NRCS must update their accepted conservation practices and processes. While most of the currently acceptable practices support the deployment of the conservation practices, many of the enhancements no longer apply, limiting producers ability to adapt and modernize their conservation practices to fit their needs. Standardization of GIS data across the departments is also essential to facilitate the enrollment of Indian Land in programs. In addition, a uniform system of NRCS funding allocation must be adopted that sets aside funding for tribal conservation efforts based on land-base.
 - NRCS funding allocations are nearly as disjointed as the BIA practices. South Dakota as a positive example, allocates NRCS program dollars by the proportion of tribal land within the state. Other states, such as Nevada and Arizona take decidedly different approaches. An analysis of the most effective approach taken by State Conservationists for getting conservation dollars on Indian land is needed, and that approach needs to be adopted across the nation.
 - NRCS payments, and other cost payment schedules for reimbursement, need to be updated to fund projects as many currently do not align with actual costs.
 - Setting standards between BIA and Natural Resources Conservation Service (NRCS) regarding compliance, practices, and length of time for conservation practices, including the respective approval processes for easements.

Suite 219

Fayetteville, AR 72701

Testimony of Carly Griffith Hotvedt, JD/MPA (Cherokee), Associate Director of the Indigenous Food and Agriculture Initiative before the House Rules and Natural Resources Committee Roundtable on Indigenous Nutrition and Food Systems on February 18, 2022.

Osiyo, Nigada. Good afternoon, Chairman McGovern, Chairman Grijalva, Ranking members Cole and Westerman and members of the Rules Committee and Natural Resources committee. My name is Carly Griffith Hotvedt. I am an attorney and the Associate Director of the Indigenous Food and Agriculture Initiative at the University of Arkansas School of Law or IFAI for short. While I am here in my capacity as the Associate Director of IFAI, my testimony today should not be considered as the endorsed opinion of the University of Arkansas. I also serve on the Oklahoma State FSA Committee assisting in the administration of USDA programs in Oklahoma. I have been engaged in agriculture beginning as a 4-H member in elementary school then FFA in high school and have been working in tribal agriculture for the last 7 years.

Hunger in Indian Country is a multi-faceted challenge. Native Americans are more likely than non-native Americans to experience food insecurities, live in food deserts, be diagnosed with metabolic diseases springing from nutritional challenges and be more reliant on federal nutrition programs. But significant progress has been made through a reinvigoration of self-determination and sovereignty, empowering tribes and indigenous people to get in the driver's seat and power their own path forward. As self-governed nations, we cannot be truly sovereign unless we can feed our own people. That is true for ANY nation. My ag economics professor in college, after witnessing the 1998 riots in Indonesia sparked from rising food costs and shortages, said to us "You will topple a government in order to feed your family."

I'd like to give some historical background and guidance as to the impacts of Federal Indian Policy on tribal agriculture and nutrition to contextualize the current state of hunger in Indian Country. Strong and fair ag and nutrition policies are critical to addressing hunger in indigenous communities. But fair policies have not been the norm for Indian Country. Even the acknowledgment of agricultural practices of indigenous peoples in the Americas has been shaped to fit narratives that were intended to control and exploit indigenous people for natural resources like land, water, minerals, and timber. Either indigenous people were seen as incapable of agriculture, or our agricultural practices were insufficient to meet volume demand with marginal results. We know this is not true. Significant settlements like Cahokia, Spiro Mound, and Chaco Canyon, which supported populations up to 25,000 people at their height, required agricultural production and surpluses to sustain so many people centrally located in one place. Maize cultivation was key. But after contact with European explorers and settlers began, impacts to indigenous peoples resulted in detriment to agricultural production.

From 1500-1600, 60 million indigenous peoples were reduced to 5-6 million in population due to disease, war, and genocide. After contact, resources enjoyed and managed by indigenous peoples in the Americas became subject to competition by settlers and colonizers. As the demand for land by non-natives arriving to the Americas increased, tribes were pushed off their homelands or lived amongst people without shared values of the same kind of respect and responsibility for land, water, and animals. The 1800's brought policies and laws resulting in the creation of reservations which restricted

indigenous people to a condensed land base, often separating us from our traditional food sources like hunting grounds, arable lands, waterways and other ecosystems that supported culturally important and traditional foodways like seasonal harvests, fishing, gathering, and location-specific sourcing.

Some tribes, like my own Cherokee Nation, were completely removed from our traditional homelands pursuant to the Indian Removal Act of 1830, in addition to the Choctaw, Chickasaw, Muscogee, and Seminole Nations. Cherokee Nation resisted removal in every way possible. Our identity as Cherokee people is tied to our relationship with the land. We brought lawsuits all the way to the Supreme Court challenging infringements on our land and our sovereignty. In Worcester v. Georgia, we won. But Andrew Jackson refused to enforce the ruling, becoming the example of practice as controlling policy versus the execution of the actual federal law and treaty language impacting tribal nations. But even treaties have been problematic.

The Treaty of New Echota which served as the justification by the federal government to physically force Cherokees off their lands into Indian Territory via the Trail of Tears, was signed on behalf of the Cherokee Nation by a minority of Cherokees that did not have the authority to represent the entirety of Cherokee Nation. That treaty ceded the homelands in exchange for lands in Indian Territory and \$5,000,000. The US Government frequently engaged individuals lacking authority to represent tribal governments if the legitimate representatives refused to negotiate to terms so desired. Cherokees protested but were ignored by Congress and President Van Buren. Many Cherokees rejected the Treaty. But Cherokees were rounded up and removed from the homelands with often just hours or minutes to organize belongings frequently at gun or bayonet point. While on the Trail of Tears, we lost over a quarter of our total population, mostly the very old, the very young and the sick. Our elders hold our knowledge. By losing so many of our elders on the trail, we lost part of our culture which included traditional ecological knowledge of our foodways. Cherokees were also forced to leave food stores, seed, and crops in the ground when forced to walk to Indian Territory. We were also removed to a place where the climate, soil, flora, and fauna were very different from where we came. But Cherokees, like so many other tribal peoples, are resilient. We rebuilt, re-established our agricultural practices and began to thrive in Indian Territory.

It was also during the era of reservation and removal, that many tribes were forced to become dependent on federal food provisions. Commodities like lard, flour, sugar, salt, coffee, and canned meat were distributed to people that largely ate unprocessed plant and protein-based diets. Commodity distribution are where frybread comes from. While it is popular and common in indigenous communities, it's a neo-cultural development resulting from a need to survive despite being a poor fit for indigenous dietary needs.

After reservation and removal, the assimilation era began. As indigenous land bases were reduced and our access to food sources became challenged, indigenous peoples were encouraged to become yeoman farmers and assimilate by practicing animal husbandry to encourage "civilization." While some tribes were already adept at those practices like Cherokee agriculturalists, like the Florida Seminole cattle ranchers, like many tribes that cultivated corn, beans and squash, many tribes were pushed into practices that were novel and inconsistent with cultural practices, traditional diets, and known food production and harvest techniques. Additionally, Indian Agents were tasked with teaching and facilitating European derived agriculture to tribes. Frequently, reservations were located on poor quality lands and Indian Agents failed to provide adequate equipment, seeds, training, and interest to support transition to yeoman farmer. Indian Agents gained reputations of dishonesty and inefficiency in dealing with tribal matters.

Children were also removed from their homes and sent to Indian boarding schools for the assimilation purpose of "killing the Indian and saving the man." When indigenous children were taken from their

homes, forced to stop speaking their language, cut their hair, wear different clothes, and adopt a non-native religion, the connection to their culture was intentionally and traumatically severed. When our elders cannot speak the same language as our youth, our ways and knowledge over our food and agriculture traditions cannot be shared in a good way, in a way that they will be continued, valued, and respected. Boarding schools also caused significant child death by abuse and neglect, resulting in further losses of continued culture.

Allotment policy was also detrimental to land access. To meet the demand for land, a scheme was developed to open up additional lands in Indian Territory for settlement. 160 to 40 acres of land would be allotted to individual Indians to encourage adoption of agriculture for individual benefit versus the communal system of production. After lands were allotted, the “surplus” lands would be distributed to the highest bidder. The justification for the distribution is jaw-dropping:

In 1885, Senator Henry Dawes said "The head chief told us that there was not a family in that whole nation that had not a home of its own. There was not a pauper in that nation, and the nation did not own a dollar. It built its own capitol, and it built its schools and its hospitals. Yet the defect of the system was apparent. They have got as far as they can go because they own their land in common ... there is no enterprise to make your home any better than that of your neighbour's. There is no selfishness, which is at the bottom of civilisation. Til this people will consent to give up their lands, and divide them among their citizens so that each can own the land he cultivates, they will not make much more progress."

I find the statement unbelievable that a nation that cares for all, can feed all, govern itself, educate children and treat the sick was criticized for not facilitating individualized agriculture competition as a measure of “progress.” That “progress” so facilitated by the Dawes Act resulted in the loss over 2/3rds of the remaining land base held by tribes. Over 90 million acres were lost through allotment and even more later due to fractionization, illicit schemes, murder, grift, and probate. For examples, research the Osage Reign of Terror. Land allotments were also frequently non-contiguous or checkerboarded, so even if a tribal allottee wished to farm his or her land, it was too difficult to occupy and maintain multiple non-adjacent parcels. Families were also allotted lands significant distances away from each other. Children's 40-acre tracts could be an entire town or section away from their parents' allotment lands. Allotted lands were frequently of lower quality compared to surplus set-asides or located in areas that were inconsistent with the promotion of farming and agriculture like on hillsides, flood plains or areas with rocky soil. Allotment policy facially promoted agriculture but in reality, was a convoluted land grab.

But despite allotment challenges, tribal nations and citizens continued to engage in new and traditional food and agriculture practices. As tribes reassert sovereignty and the federal government recognizes the benefits of tribal self-government, Native Americans are enjoying better opportunities for nutritious and culturally relevant foods consistent with the dietary needs of indigenous bodies.

Tribal Sovereignty and Self-determination is the solution for hunger in Indian Country. While prior Farm Bill programs did not adequately serve tribes and tribal communities, the 2018 Farm Bill was the most tribally inclusive Farm Bill to date. Tribes were given parity with states in being able to access and administer many USDA Programs. A 638 pilot was authorized in the Nutrition Title allowing tribes operating the Food Distribution Program on Indian Reservations to source local and tribally produced food products as a component of the foods offered to eligible recipients. This program encourages additional federal dollars to circulate on the reservation, helping develop and support local and regional tribal food economies by creating market opportunities for producers. We need more of that. Federal policy to facilitate not just direct provision of nutrition but also indigenous procurement is critical.

Self-directed governance of tribal land bases is critical as well. Many tribes are subjected to BIA land management policy wherein leasing programs require tribally held trust lands available for lease to be awarded to the highest bidder regardless of whether the bidder is a tribal member or not. Non-native leaseholders do not recirculate dollars produced derived from the production activity on lands leased on the reservation. In fact, most dollars derived from production activity on leased tribal lands are spent or allocated off-reservation. Tribes have frequently pushed back against that BIA policy to promote a tribal preference in leasing tribal lands but are met with significant barriers in seeing that policy adopted and promoted. The American Indian Agriculture Resource Management Act provides a vehicle for tribes to express tribal preference for agricultural land management, called an Agricultural Resource Management Plan or ARMP, that requires the BIA to assist in enforcing the provisions of the plan. ARMPs can also incorporate conservation policy, best management practices, land remediation priorities, production preferences and land tenure guidance. But lack of initiative, institutional knowledge, funding, and consultation by the BIA have resulted in a lack of access for this great tool. Tribes must fight for funding authorization and then receive unclear instruction on how to proceed in the development of ARMPs including how to solicit funding, whether a NEPA or Environmental Review or Assessment is need and at what point in the process, how to implement the plan and how the BIA actually assists with implementation and enforcement. This is one of the most egregious examples of a violation of the fiduciary trust responsibility that the federal government has in administering BIA programs for the benefit of tribes. Fully funding programmatic activity as set out in AIARMA is critical for the self-direction of agricultural resources by tribes.

There are many other policy opportunities that Congress can support to empower tribes to conquer hunger in Indian Country. I would encourage members of the Rules and Natural Resources Committee to secure a copy of a report to come that will be issued by the Native Farm Bill Coalition detailing policy changes within the Farm Bill to better resolve food and agriculture challenges in Indian Country. Parity in access and support for self-determination will go a long way in being able to feed ourselves. Food Sovereignty is Tribal Sovereignty.

I appreciate the opportunity to share with the House Rules and Natural Resources Committee. I hope the information shared better clarified the state of hunger, food and agriculture in Indian Country and highlighted the role Congress can play in addressing these challenges. I look forward to being available as a resource for the committees as well as the role the Indigenous Food and Agriculture Initiative can provide in assisting the committees further upon request.

Wado.

Kamehameha Schools®

Testimony of Kā'eo Duarte Vice President of Community and 'Āina Resiliency

February 18, 2022

RE: U.S. House of Representatives Committee on Rules and Committee on Natural Resources - Joint Roundtable Discussion Examining Indigenous Nutrition and Food Systems

Aloha e Chair McGovern, Chair Grijalva, and honorable members of the Rules and Natural Resources Committees.

Thank you for this opportunity to provide input on Indigenous nutrition and food systems. Kamehameha Schools is a private trust established by Ke Ali'i Bernice Pauahi Bishop, the great granddaughter and last royal descendent of Kamehameha I. Our mission is to create educational opportunities in perpetuity to improve the capability and well-being of people of Hawaiian ancestry.

As a Native Hawaiian educational organization and landowner, we recognize our deep kinship to 'āina (*land, that which feeds*), its native ecosystems, cultural resources, and water resources that continue to shape Native Hawaiian identity. We believe as an Indigenous people, we have inherited the responsibility, through our genealogical connections, to ensure the health and vitality of our lands in perpetuity. We believe that the health and vitality of the 'āina, including the state of our Indigenous food systems, have a direct impact on the educational outcomes of our learners and the health and well-being of all people in Hawai'i.

Summary of Recommendations

For the reasons discussed in more detail below, Kamehameha Schools supports the preservation, expansion, and improvement of Indigenous food systems on our lands and beyond. By supporting Indigenous food systems, we better serve the nutritional needs of Indigenous peoples, resulting in better educational and life outcomes. To actualize the full benefits of thriving Indigenous food systems, we encourage Congress to further explore ways the federal government can assist in the following efforts:

- Reconnecting Indigenous people to their traditional foods and the systems that produce them by:
 - Supporting and expanding farm-to-school programs in Indigenous communities
 - Re-integrating Indigenous crops within the medicinal landscape to address health and wellness within our Indigenous communities
 - Supporting career pathway development within Indigenous food systems
- Increasing access to Indigenous foods within our communities by:

- Improving the availability and affordability of Indigenous foods, particularly for low-income Native families, including through programs such as the Supplemental Nutrition Assistance Program (SNAP)
- Supporting solutions such as food hubs, which can assist farmers growing Indigenous crops to make their produce accessible to Native consumers.
- Improve production of Indigenous crops by:
 - Improving access to capital for mitigation efforts to protect Indigenous crops from biological threats such as diseases, pests, and invasive species
 - Expanding support to food hubs that are the backbone of small farmers - including Indigenous and minority farmers
 - Incentivizing farmers to grow Native crops including kalo (taro), 'ulu (breadfruit), mai'a (native banana), and other Native Hawaiian staples
- Improving the resiliency of Native communities' food systems by:
 - Supporting policy to celebrate and grow each state's unique locally grown crops
 - Supporting policy that protects the authenticity of Hawai'i made products

The following sections describe in more detail these needs and opportunities to improve Indigenous food systems as observed through the work of our organization serving Native Hawaiian communities.

Federal Trust Responsibility to Native Hawaiians

In considering the federal government's role in supporting the nutritional needs and food systems that serve Native Hawaiians, it is important to first recognize that Congress has consistently and expressly acknowledged a special political and trust relationship with Native Hawaiians based on our status as the Indigenous, once-sovereign people of Hawai'i in the enactment of more than 150 legislative measures. This is the same trust responsibility that Congress has recognized is owed to all Native peoples of the United States. Accordingly, Congress has enacted programs and policies to promote education, healthcare, housing, and a variety of other Native Hawaiian community needs. These programs are administered by the Executive Branch, often through Native Hawaiian organizations.

Overview of Indigenous Food Systems

Indigenous food systems are methods of cultivating local ingredients based on Native-born knowledge and innovation developed over many generations. These systems exist as a testament to the endurance of Indigenous peoples throughout the centuries, and some experts argue they are now more important than ever. Not only do Indigenous food systems provide much-needed nutrients and diet diversity to their local population, but they also demonstrate innovation, adaptability, and biodiversity in the face of major challenges, such as climate change. Indigenous food systems are aligned to Native cultural identity and values toward land and perpetuate sustainable practices capable of serving many generations going forward, which is especially important for Native Hawaiians living on an island with limited resources.

Indigenous food systems are also critical to the health and well-being of all Indigenous people, contributing to food security and the eradication of hunger and poverty. These contributions promote better health outcomes, which are critical for Native Hawaiians and other Indigenous peoples who are disproportionately affected by chronic conditions compared with other racial/ethnic groups. These diet-related issues are often connected to a reliance on outside food sources that put the health of Indigenous people at risk.

Reconnecting Indigenous People to Our Foods

Historical injustices and modern society have in many ways forced Native people away from their ancestral lands and, in the process, disconnected us from the Indigenous food systems that have provided physical and social sustenance to our people for generations. In Hawai'i, many do not see farming or other food production as a financially viable career path. Native students, driven by the need to earn degrees or other credentials to find gainful employment, are often restricted to classrooms or digital settings. Most never get the opportunity to experience growing their food, harvesting, and preparing their own meals. As a result, our current educational and societal system has fostered generations of people disconnected from our food and the systems that provide it.

As an educational institution, we are expanding curriculum to reconnect our students to the process of growing and preparing food. Programs like Farm-to-School support curriculum that teaches our children about our Indigenous crops, reconnecting them to their culture and improving their food security. School gardens give students the opportunity to experience growing food, helping them understand the work that goes into the food they consume. Procurement of locally grown and indigenous foods for school meals fosters additional educational opportunities and provides the nutrition students need to pursue academic success. The opportunity to eat locally grown and Indigenous foods at school encourages students and their families to change their eating habits at home and reconnects them to the foods of their ancestors.

For these reasons, we encourage Congress to further support Farm-to-School programs, emphasizing programs in Indigenous communities, including by:

- Incentivizing or providing additional resources for schools to purchase Indigenous foods and diversify menu offerings in school lunches; and
- Supporting school garden programs to refamiliarize our students and families to our indigenous crops.

We also believe that re-integrating Indigenous crops within the medicinal landscape to address health and wellness within Indigenous communities and supporting career pathway development within Indigenous food systems are other key strategies to reconnect Indigenous peoples with our traditional foods.

Increasing Access to Indigenous Foods

Food sovereignty empowers Native households and communities to address issues of hunger and health by cultivating their own healthy, fresh foods. Unfortunately, barriers to accessing healthy and nutritious foods, including Indigenous foods, for our Indigenous people exist. While many of Hawai'i's rural areas have farms, the community often lacks access to the food produced on these farms. Many farms do not have the capability to sell directly to customers and face challenges when selling via a farmer's market or through other forms of retail. It's also difficult for farmers to compete financially with imported foods, resulting in locally produced foods being more expensive.

These challenges make it difficult for Native households and communities to have access to healthy and nutritious foods, leading to a greater dependency on processed and imported foods, resulting in the importation of 85% of the food consumed in Hawai'i.

Native Hawaiians are a large percentage of the workforce that do not make a living wage, and are thus forced to purchase cheaper, and often processed, less healthy foods. Healthy food incentive programs have increased the purchasing power of low-income families to buy fruits and vegetables at grocery stores and farmers' markets, thereby helping reduce hunger, improve nutrition, and support U.S. agriculture and retail.

One example is Hawai'i's DA BUX Double Up Food Bucks program, which increases the purchasing power of SNAP recipients toward locally grown fruits and vegetables. Colorado State University found that each DA BUX incentive dollar matched on a SNAP dollar to purchase local produce has an economic multiplier of 2.3, which means each incentive dollar used by a SNAP recipient to purchase local produce contributes \$2.3 dollars to Hawai'i's economy. If the DA BUX program was further scaled to food retail locations statewide, the potential economic contribution would be \$14M-\$22M in one year. This would help families, ensure that small businesses and local farmers thrive, and provide for a more sustainable local economy in Hawai'i. As of May 2021, 203,885 Hawai'i residents were receiving SNAP benefits in Hawai'i, a 15% increase from the previous year.

For these reasons, we encourage Congress to help improve food access for Indigenous communities by:

- Continuing to support programs like SNAP and DA BUX, which have assisted Native Hawaiians in purchasing of Indigenous healthy food options.
- Supporting food hubs, which can assist farmers growing Indigenous crops to make their produce accessible to Native consumers.

Production of Indigenous Foods

Indigenous crops and the traditional agroecosystems they were grown in, were developed over many generations and work in harmony with the environment, improving and protecting the biodiversity of the land and the well-being of our people. Indigenous food systems often play a wider role in environmental conservation and can also help address climate change. For example, the Cherangani people in Kenya have returned to traditional agroforestry methods,

such as intercropping avocado, bean and coffee crops, to help cut down on soil erosion and reduce water loss.

“Indigenous peoples more than any other peoples in the world are deeply connected with nature and with natural resources, so whatever they do is in relation to the concept of sustainability, of protection and conservations of natural resources,” says Mattia Prayer Galletti, lead technical specialist focusing on Indigenous peoples and tribal issues at International Fund for Agricultural Development (IFAD).

Recently, researchers from the University of Hawai‘i at Mānoa published a study highlighting the role Indigenous agriculture could play in producing food while supporting biodiversity and Indigenous well-being in Hawai‘i. The report’s authors found that in one experimental model, the state could have sustained around 250,000 acres of traditional agroecosystems, which would have boosted its food production to more than one million metric tonnes of food annually.

"Our study really highlights the relevance of restoring Indigenous agricultural systems today," said Dr. Tamara Ticktin, professor of botany at UH Mānoa and co-author on the study, in a press statement. "These systems are flexible and adaptive, and include both traditional and modern crops relevant today."

Challenges to Indigenous Crop Production

While we understand that growing Indigenous crops is good for the environment, produces nutritious food, and improves the well-being of our Native population, there are many challenges that impede efforts to increase production of Indigenous crops.

One of the biggest challenges is that many Indigenous crops are highly susceptible to disease. An example of this is kalo (taro), where Indigenous kalo strains get wiped out by blight but non-Indigenous varieties have shown to be resistant. Similarly, now that ‘ulu (breadfruit) and māmaki (*Pipturus albidus* - a plant made into Hawaiian tea) are becoming commercial crops (especially monocrops), we are starting to see pests and diseases come out that haven’t impacted them before.

Another challenge in increasing production of Indigenous crops is the high cost of land, water, machinery, infrastructure improvements, and labor in Hawai‘i. Due to these high costs, it is difficult for Indigenous crop farmers to be profitable in Hawai‘i, especially when they are competing with imported, non-indigenous food products. Our Native starches, kalo (taro), ‘ulu (breadfruit), and ‘uala all compete against much cheaper imported starches such as rice, potatoes, sweet potatoes, and processed starches like bread and pasta, while other Native crops such as banana and coconut compete with imported versions that are available at much cheaper prices.

Because of the high cost of producing Indigenous crops here in Hawai‘i and the struggle with access and affordability to these crops (as mentioned above), the customer base for farmers is limited. One way to address this issue is to support the development of food hubs, which

aggregate products from multiple farms and sell the products to customers. Aggregation increases the supply for the food hubs' customers, increases the market size and stability for farmers, and allows larger institutions to source products locally. This supports the State of Hawai'i's goals to increase procurement of local food products by departments, such as the Department of Education and others, better enabling programs such as Farm-to-School.

For these reasons, we encourage Congress to help increase the production of indigenous crops by:

- Improving access to capital for mitigation efforts to protect Indigenous crops from biological threats such as diseases, pests, and invasive species.
- Expanding support to food hubs that are the backbone of small farmers - including Indigenous and minority farmers.
- Incentivizing farmers to grow native crops, including kalo (taro), 'ulu (breadfruit), mai'a (native banana), and other Native Hawaiian staples.

Improving the Resiliency of Native Communities' Food Systems

In response to rising levels of insecurity, complexity, and vulnerability in our lives, we focus on growing our resiliency. Resiliency refers to our collective ability to respond and recover from adverse conditions, including natural disasters, public health crises, economic hardship, consolidation of power, and cultural loss. We can become more resilient by preparing for and adapting to shocks in our food system and cultivating diverse, local and regional economies.

One way we can do this is by supporting the locally grown crops unique to specific regions throughout the country, which are major contributors to local and regional economies and food systems. For example, two of our largest producing crops in Hawai'i are macadamia nuts and coffee. In 2021, nearly 7,000 acres of coffee was harvested in Hawai'i, yielding an estimated 23.8m lbs. In 2020, nearly 17,000 acres of macadamia nuts were harvested, yielding 49m lbs. On Kamehameha Schools' land, tenants grew approximately 1,900 acres of coffee and 1,700 acres of macadamia nuts, producing nearly 7 million lbs of coffee and 4 million lbs of macadamia nuts. While these are not Indigenous crops for Native Hawaiians, the production of these crops helps support the collective food system and local economy that includes Indigenous crops.

For these reasons, we encourage Congress to support growing the resiliency of our Native communities' food system by:

- Support policy to celebrate and grow each state's unique locally grown crops; and
- Supporting policy that protects the authenticity of Hawai'i made products.

Conclusion

We are grateful for this roundtable discussion, which we hope will lead to greater ongoing conversations to improve the food systems that serve Native Hawaiians and all Indigenous peoples across the country.

Founded in 1887, Kamehameha Schools is an educational organization striving to restore our people through education and advance a thriving Lāhui where all Native Hawaiians are successful, grounded in traditional values, and leading in the local and global communities. We believe that community success is individual success, Hawaiian culture-based education leads to academic success and local leadership drives global leadership. Hānai i ke keiki, ola ka lāhui; nurture the child, and the people thrive.

Intertribal Agriculture Council
PO Box 958, Billings, MT 59103

Roundtable on Ending Hunger in America: Indigenous Nutrition & Food Systems
Before Members of the House Rules and Natural Resources Committees
February 18, 2022

Introduction

Testimony of Lexie Holden, Associate Director of Policy & Government relations of the at the Intertribal Agriculture Council (IAC), presented before members of the House Rules Committee and House Natural Resources Committee.

Chairman McGovern, Chairman Grijalva, and Members of the House Rules and Natural Resources Committees, thank you for inviting me to provide you all with testimony regarding our efforts to end hunger in Tribal communities. My name is Lexie Holden and I serve as the Associate Director of Policy & Government relations at the Intertribal Agriculture Council. I am a member of the Choctaw Nation of Oklahoma and an alum of the 27th Class of Bill Emerson National Hunger Fellows. Today my testimony will focus on food insecurity during COVID-19 and the resiliency of Tribal communities.

Intertribal Agriculture Council (IAC)

The Intertribal Agriculture Council (IAC) was founded in 1987 to pursue and promote the conservation, development, and use of our agricultural resources for the betterment of our people. Land-based agricultural resources are vital to the economic and social welfare of many Native American and Alaskan Tribes. Prior to 1987, American Indian agriculture was practically unheard of outside reservation boundaries. Today, federal, state, and organizational partners draw upon IAC's expertise to inform programming and policies that impact Indian Country.

The State of Hunger Across Indian Country Pre-COVID

My colleague, Carly Hotvedt from the Indigenous Food and Agriculture Initiative, shared an excellent overview of the policies which have shaped Indian Country. I will now discuss the impact of those policies on present-day levels of food insecurity.

Food insecurity is “a lack of consistent access to enough food for an active, healthy life.”¹ We argue that this food should also be affordable, nutritious, and culturally relevant, as well as located in areas that are accessible to all regardless of one’s ability or zip code.

Prior to the COVID-19 pandemic, rates of food insecurity for American Indian/Alaska Native households were double that of non-AI/AN households. Whereas 1 in 8 Americans faced food insecurity in 2019, 1 in 4 Native Americans were food insecure.²

However, these statistics do not portray the true state of hunger across Indian Country. For some Tribal communities, the rate of food insecurity can be as high as 92%.³ Studies of food insecurity tend to undersample Native populations; they tend to combine Native Americans with other racial/ethnic demographics; and often, they tend to mislabel us as “something else,”⁴ “other,”⁵ or excluded altogether. Data is used to inform federal policies and funding, and we see the effects of our underrepresentation when we look at the overall investment in Tribal citizens by the US government and see that it is only two-thirds of that which is invested in non-Native US citizens.⁶

Indian reservations tend to be in very rural parts of the country.⁷ Prior to the pandemic, this already left many Tribal communities at the end of the food supply chain, resulting

in higher prices, lower food quality, and limited choices at the grocery store.⁸ Beyond food access, Tribal communities also tend to have elevated rates of unemployment and poverty. Access to healthcare is also limited for Tribal communities, despite higher rates of obesity, diabetes, and smoking.⁹ When we examine the relationship between health, poverty, and food insecurity during COVID-19, it is not surprising that Native Americans were 3.5 times more likely to catch COVID than white individuals, and 2.8 times more likely to die from it.¹⁰ These numbers are in spite of the fact that Native Americans have the highest vaccination rates of any demographic.¹¹

Thanks to the Native American Agriculture Fund (NAAF), the Indigenous Food and Agriculture Initiative (IFAI), and the Food Research and Action Center (FRAC), we now have a study detailing the impacts of COVID-19 on the rate of food insecurity in Native American communities. From over 500 survey responses, we learned that the overall food insecurity rate for Native American households without children was around 42% and for families with children, that number leaped to around 51%.¹²

Resiliency of Native American Producers & Tribal Communities

Despite all of this, Tribal communities have always been, and continue to be, resilient in the face of adversity. I would like to highlight some of the 2021 success stories from the Intertribal Agriculture Council's Technical Assistance (TA) Network. Our TA Specialists were instrumental in helping Native American agriculture producers remain in operation during the pandemic so that they could continue to feed their communities. In 2021, the IAC's Technical Assistance network served over 13,000 individual Tribal

producers, Tribal government contacts, and partners.¹³ A few of the projects our Technical Assistance Specialists led include:¹⁴

- The Tribal Elder Food Box Distribution program, which sourced products from local Tribal producers and fed Tribal elders (*Daniel Cornelius, Great Lakes Region*)
- The Food 4 Families Processing Coupon initiative, which let Tribal youth involved in 4-H process their show animals, feeding their families and communities (*Katherine Minthorn, Northwest- Oregon/Idaho*)
- Disaster assistance program outreach, which kept producers' operations afloat during unprecedented drought conditions resulting in decreased livestock feed availability (*Mike Shellenberger, Northwest- Washington*)
- Soil health workshops to support regenerative agricultural practices among producers, reducing and reversing the effects of climate change in production (*Desbah Padilla, Southwest Region*)

A Path Forward

After speaking with our producers, Tribal leaders, TA Specialists, and other stakeholders, we have collected several suggestions for how to eliminate hunger across Indian Country, during the COVID-19 pandemic and beyond. They include:

- Expanding 638 Tribal Self Governance Authority to allow more Tribes to source products for the Food Distribution Program on Indian Reservations (FDPIR) from local and regional Tribal producers
- Enabling Tribal governments to administer all federal nutrition programs
- Creating set-aside programs at USDA to increase Tribal producers' access to credit, land, equipment, crop insurance, and other resources relevant to agriculture production

**INTERTRIBAL
AGRICULTURE
COUNCIL**

Intertribal Agriculture Council
PO Box 958, Billings, MT 59103

-
- Removing the restrictions on concurrent usage of the FDPIR and Supplemental Nutrition Assistance Program (SNAP)
 - Working with Native American data scientists to better count American Indians/Alaska Natives in all federal studies related to nutrition and agriculture
 - Continuing to make investments in Tribal food economies; a \$528 million investment in infrastructure for regional food hubs across Indian Country could create a potential return of over \$9.4 billion¹⁵

Thank you for taking the time to listen to my testimony. I believe that ending hunger in Indian Country is possible, so long as those in power continue to listen to us and make investments in our communities. I look forward to answering your questions.

If you wish to reach me after the conclusion of this roundtable, please feel free to email me at lexie@indianag.org.

“Much like the 2014 Farm Bill, which was projected to spend \$956 billion over a 10-year period, the 2018 Farm Bill will be one of the largest non-defense funding authorizations to be considered in the history of this country. Since the Intertribal Agriculture Council’s inception, we have struggled to rally the support of tribes to effectively advocate for greater Native inclusion in previous Farm Bills. This document will serve as a new foundation for our ongoing efforts, working in partnership with the Indigenous Food and Agriculture Initiative, the SMSC’s Seeds of Native Health campaign, the National Congress of American Indians, and the Intertribal Timber Council to ensure well-crafted, effective, and thoughtful agriculture and nutrition policy; and a soapbox from which tribal voices can be heard in creating of that policy.”

ROSS RACINE

Executive Director

Intertribal Agriculture Council

National
Congress of
American
Indians

“For many years NCAI has been involved in Farm Bill discussions and negotiations as our tribal leadership and membership have recognized the important opportunities it provides for Indian Country. With so many tribal governments recognizing the importance of securing self-determination in the development of food systems for tribal citizens, we join the call to ensure that Indian Country’s voice is included in the upcoming Farm Bill discussions. We believe that the next step in strengthening tribal communities will be through diversified economic development, including food and agriculture production and businesses, natural resource development, as well as a more intense focus on infrastructure development. This document will help us examine the breadth of opportunities that are available throughout the Farm Bill to allow Indian Country to achieve its goals through advocacy and engagement.”

JACQUELINE PATA

Executive Director

National Congress of American Indians

“The Farm Bill provides important congressional authorization and direction on the health of forests. Tribal forests and woodlands are critical assets that contribute to the lives, well-being, and economic vitality of tribes across the country. The Intertribal Timber Council supports additional tools in the Farm Bill reauthorization to help tribes manage their forests and woodlands, while protecting them from wildfire, pests and disease.”

PHIL RIGDON

President

Intertribal Timber Council

The grassroots movement to reclaim Indigenous foodways, improve our food security, and assert our food sovereignty is growing throughout Indian Country. But the role and influence of the federal government in Native nutrition, agriculture, ranching, fishing, forestry, and conservation remain enormous.

Just as the change in seasons brings new rhythms to everyday life – sowing, cultivating, growing and harvesting – the change in political seasons brings new tasks in the life of our communities.

As the Trump Administration and the 115th Congress prepare to shape the next Farm Bill, there has never been a better – or more critical – time for Native Americans to unite around this task: to consider our common goals, join together, and advocate for our interests in this mammoth piece of domestic legislation.

Frankly, there is much at risk for us in the next Farm Bill. But, with a spirit of both realism and hope, we also can envision new, positive opportunities for tribal governments, Native producers, environmental stewards, and community members. For that reason, we commissioned one of the great food leaders in Indian Country, Janie Hipp, to analyze these risks and opportunities. Janie and her colleague Colby Duren worked in close consultation with the Intertribal Agriculture Council, the National Congress of American Indians policy staff, and the Intertribal Timber Council to develop this exhaustive report and ensure that it reflects the broadest perspective possible.

This report is not the end – it is the beginning – of what we hope will be a heightened consideration of the importance of our voices in this process.

We hope this report may provide the basis for a new, increased degree of involvement and collaboration by tribal leaders, activists, citizens, and our allies in the debate over the Farm Bill. If we work together, Native Americans on reservations and in urban areas alike can take another important step forward in controlling our own economic, nutritional, cultural and spiritual destinies.

Sincerely,

SMSC Business Council

Chairman Charles R. Vig

Vice-Chairman Keith B. Anderson

Secretary/Treasurer Freedom Brewer

INTRODUCTION

The long history of federal food and nutrition policy can be traced to our nation's early days. The agriculture committees in Congress are among the oldest: the House of Representatives agriculture committee was established in 1820 and the Senate agriculture committee in 1825. The United States Department of Agriculture is the second oldest federal agency and is the primary federal department charged with overseeing domestic and international policy related to: U.S. food security; domestic food systems; international food policy; trade; nutrition; conservation; rural development; research; and the nation's forest system. As the first farmers, ranchers, irrigators, food producers, and stewards of this land, each of these important policy areas have significant impacts and meanings for Indian Country. We must be engaged in the improvement and development of federal food policy because it directly impacts our lands, our foods, our waters, our natural resources, and our economic development opportunities.

The Farm Bill is the major omnibus piece of federal legislation that addresses all of these policy areas. While U.S. federal laws crafting food and agriculture policy can be traced into the 1800s, and a bit earlier, state and local laws relating to food and agriculture can be traced back even further as agriculture production and trade led to the birth of many states and localities. The more modern provisions of what we now refer to as the federal Farm Bill were first envisioned in the 1930s. Prior to the 1930s, federal law consisted primarily of provisions to provide land to farmers; credit or other financial support to food producers; and research to establish the original land grant institutions. Strikingly, these early pre-1930s provisions which created new farming communities and opportunities for homesteading settlers, represented a great loss by tribes of our communities, many citizens, our foods, and our traditional homelands through hundreds of treaties between the early United States and Tribal Nations. This created a complex and storied history that still impacts tribes and tribal agricultural today.

.. ———— x ^ x ———— ..

*Indian Country's relationship
with farming and ranching
is a tale of two worlds.*

Indian Country's relationship with farming and ranching is a tale of two worlds. On one hand we, as Indigenous peoples, have long been engaged in feeding ourselves. Our significant relationship with this continent's plants, animals, and food systems is well-established in written historical accounts, oral traditions, and archaeological and anthropological evidence. Most of our early and ancient communities on these lands were deeply involved in complex agricultural systems; some were among the first "agricultural researchers," domesticating a wide variety of crops used for feeding our communities and families. The history of the foods commonly eaten in the U.S. today, and around the world, can be traced to original Indigenous peoples.

On the other hand, we, as Indigenous peoples, have been forced for centuries to endure the sidelining of our deep and complex food system knowledge in favor of supporting the food systems of those who claimed this continent as their new home. We were told to be "farmers" in our early treaties, yet forced to ignore the food systems that existed in this country for centuries in favor of establishing farming and ranching practices more familiar to the new settlers. Treaties, federal removal, and reservation policies led not only to the loss of our rights to be at home on our own traditional lands, but to feeding our people in food systems which had supported us for centuries. These new federal policies led to significant disconnections between us and our existing food systems, and the sheer act of feeding ourselves, which was the embodiment of self-determination and self-governance in food we had exercised for so long, was lost.

The treaties between the United States and various Tribal Nations clearly show the intent of those executing the treaties to "assist" Tribal Nations in the pursuit of "farming." While these treaties are the legal embodiment of loss, trauma, pain, anger, and removal from our lands, the language of "farming" remains nonetheless. Many of these early

treaties discuss at length the assignment of tracts of “tillable” or “arable” land in established acreages for “cultivating the soil as farmers.”¹ Such lands were decreed to no longer be held in common, but held “in the exclusive possession of the person selecting it, and of his family, so long as he or they may continue to cultivate it.”² The employment of individuals to “instruct (them) in the mode of agriculture suited to their situation”³ was recognized as a duty of the federal government. When Indians selected lands for cultivation, treaties specified that “the agent shall be satisfied that he intends in good faith to commence cultivating the soil for a living, he shall be entitled to receive seeds and agricultural implements.”⁴ Some treaties described tracts of land “upon which their improvements as an agricultural people are to be made” so that their “wandering habits” could be curtailed and went further to identify the employment of farmers “whose duty it shall be to assist the [Menominee] Indians in the cultivation of their farms, and to instruct their children in the business and occupation of farming.”⁵

What is clear from the language of many treaties is that the United States government explicitly intended for Indigenous peoples to become farmers, but ignored the basic premise: that we as Indigenous peoples had been feeding ourselves within sustainable food systems since time immemorial, and we were not dependent on anyone but ourselves

to do so. When our lands were taken from us in exchange for peace and land for the rapidly escalating number of immigrants to this land, we

were told to be “farmers.” A “farmer” by any standard definition is one who cultivates the land to feed him or herself and others around him or her. Many of our ancestors had been “farming” for centuries. But in ways that were known to us and were in concert

and harmony with the lands, water, plants, and animals. Many tribes had deep trade relationships with other tribes in the currency of food.

While the lengthy history of those treaties and the parallel history of our peoples, their relationship with their lands, and their ability to feed themselves have been fraught with stories, many too terrible to tell, what isn’t well known is that all Indian Country has a stake in a modern Farm Bill. We must amplify this because our health, our well-being, and the building of sustainable economies within our communities requires that we not turn away from this important piece of federal legislation. The Farm Bill focuses on the policies that are important to us all: food security; food production; creating food businesses; conservation of our lands; building trade relationships; continuing to grow our knowledge of foods we rely upon; building strong communities; and ensuring the infrastructure of our communities can be built, repaired, and continually improved.

.. ——— x X x ——— ..
Many of our ancestors had been “farming” for centuries. But in ways that were known to us and were in concert and harmony with the lands, water, plants, and animals.

FARM BILL

The “Farm Bill” is the major, omnibus legislative act historically considered by Congress every five years that serves as the primary vehicle for developing these federal food and nutrition policies. The most recent version of the Farm Bill was passed in 2014.⁶ When passed, the Congressional Budget Office projected that the 2014 Farm Bill would have \$489 billion in spending over five years, with: 80 percent of the outlays funding nutrition programs; 8 percent funding crop insurance programs; 6 percent for conservation programs; and 5 percent funding commodity programs. The remaining outlays fund all other programs authorized by the act, including: trade, credit, rural development, research, marketing, forestry, energy, agriculture, and an assortment of other miscellaneous programs.

Indian Country, with only a few exceptions, has been primarily absent from Farm Bill discussions that establish national food policy for decades. We have relied upon a few active tribes and policy specialists, who have been dedicated to advocating for and correcting problems with federal food and agriculture policy on behalf of all of us. The importance of honoring those voices now cannot be overstated. But the health of our people and the survival of our communities depends on us now finding a louder voice. The seeds of our health require watering and tending. Whether we like it or not, the health and well-being of our people and our tribes necessitate that we become more engaged. Since it is passed approximately every five years,

Farm Bill policies stretch across administrations, making most of the debates, by their very nature, bipartisan. The voices in the Farm Bill encompass urban and rural views that stretch across the entire country and around the world. They can champion conventional production, organic, local, export, raw commodity products, and value-added products. Some groups advocate exclusively for nutrition and feeding programs. Others work on issues related to the business of farming and food production. Some focus on research and extension of knowledge. Others focus on conservation of private or public lands and our nation’s forest lands. Despite how messy it can be, it is critical to harmonize all these interests.

Indian Country’s relationship with the Farm Bill has clearly been complex. We have sought changes to sections that directly affect us and we have partnered with others, Native and non-Native alike, to have our voices heard. But we have not taken a deeper, more targeted approach to exerting ourselves in large ways across the entire Farm Bill landscape. While some might say that Indian Country is not affected by every section or title of the Farm Bill, that is simply not the case. Nearly 25 percent – and in many communities more than 50 percent – of all our citizens may directly access and participate in the feeding programs that make up almost 80 percent of the Farm Bill outlays of the Nutrition Title.⁷ Tribal lands⁸ are deeply engaged in agriculture. In fact, more than 50 million acres

of our lands are engaged to some extent in food production and agriculture.⁹ Our lands participate in the programs. Our people have farm and ranch loans and guaranteed loans. Our Tribal Colleges and Universities receive funding under the Research Title. Our food products are the subject of trade and are affected by the Trade Title. And on and on.

We are entering a period when Indian Country voices in the Farm Bill debate need to be louder. The full scope of food and agriculture programs must be available to us in order to turn the page on the significant food and health-related impacts within our own Native communities. We have the highest numbers per capita of individuals who are dependent on feeding programs in the United States. Our health disparities are among the worst of any population group in the nation. Our rural, reservation, and isolated communities are in dire need of infrastructure and economic development focus. While we have access to millions and millions of acres of lands that are already engaged in some form of food production, the very foods raised and grown on our lands do not stay within our communities to feed our people and grow our communities and economies.

We can hold on to and encourage the momentum surrounding the “food sovereignty” movement so many of our Indigenous peoples are engaged in; we can encourage and promote the utilization of our lands to enhance our own and others’ food security during a time of a growing world population; and we can seize the opportunity to build food infrastructure in our communities and regions to ensure that the changes we want to make are cemented in place for future generations. To do so, we need to have a bigger voice in the Farm Bill.

The Farm Bill provides resources and programs that will allow us to reach our goals more quickly than in the past. We have access to land and water that we can strategically utilize to improve the health, well-

being and economies of our communities; and we live at a time when people are seeking food that matters. We cannot ignore the singular piece of federal legislation that can either slow down or speed up our journey to health, food security, food sufficiency, food access, and food economic sustainability. As we become more engaged with the Farm Bill, many will welcome our voices and presence in the upcoming food and agriculture policy debates.

This document offers a glimpse of the structure of the Farm Bill and the historical context surrounding key components of the current bill. It also discusses the promises and opportunities as well as the challenges and barriers associated with the Farm Bill. We recognize that this is a complex journey. We hope you will glean from this document a sense of the policy levers that can improve our personal health and economic viability goals; the many reasons to become active and lend our voices to a more significant, unified presence in the upcoming Farm Bill debates; and the immense opportunities to come. Our time is now, so, let’s begin the discussion.

.. ————— x ^ x ————— ..
We are entering a period where Indian Country voices in the Farm Bill debate need to be louder.

THE FARM BILL: SOMETHING FOR EVERYONE

When then President Obama signed the 2014 Farm Bill into law, he referred to the bill as a Swiss Army knife, because of the multiple functions of the Farm Bill: research, jobs, infrastructure, conservation, innovation, safety net, and health and nutrition. The bill itself is currently structured around 12 titles, each with varying sub-sections. Every title of the bill is important to Indian Country. The discussion below will explore the purpose and relevance of each of these titles and the many subsections to tribes. For the most part, we have tended to focus on a few sections for a narrow purpose and have seldom expanded our voices to impact the entirety of the Farm Bill on behalf of the entirety of Indian Country.

Before we delve into these deeper discussions of sections and titles, one overarching comment must be made. For the most part, **USDA programs and authorities strewn throughout the Farm Bill have very few “Indian-only” focused programs, very few “set-asides” for tribes, and USDA does not have “638” self-governance contract and compact authority.**¹⁰

638 authority would give tribes the ability to engage more simply and efficiently with all USDA agencies and assure tribal administration and control of the delivery of the vast array of USDA programs. Many USDA programs and authorities lend themselves well to tribal management under 638 authority.

But this authority must be granted by Congress to USDA in order for USDA to begin negotiations and for tribes to start the implementation processes necessary to manage these programs. It is critical that we advocate for 638 authority for nutrition and forestry programs in the 2018 Farm Bill.

The Farm Bill focuses on the needs of the United States in several key areas, such as feeding programs and nutrition; farming, ranching, and food businesses; rural development; rural infrastructure; research that affects food, agriculture, and related areas; markets and trade due to their importance to agriculture; conservation of lands; and forestry. Most of the programs and services in the Farm Bill

are designed to be broadly accessible. With some notable exceptions which are discussed below, these provisions are not “tailored” to the needs of tribes. The discussion identifies several key policy areas where “set-asides” or “Indian-only” programs would be very appropriate and would build on language that already exists in the Farm Bill.

We also discuss the importance of the simple act of including “tribal governments” in the existing intergovernmental approaches through which many of the USDA programs are delivered. Many tribes are taking steps to create **“Tribal Departments of Food and Agriculture”** within their tribal governments. These departmental offices at the Tribal level must be incorporated into the existing intergovernmental relationships honored for decades by USDA. And finally, most USDA programs haven’t even begun to be seriously utilized by tribes because, for the most part, we are invisible in those relevant Farm Bill sections authorizing the programs. But we need to act now to change that. Creating our own Departments of Food and Agriculture is an important way to place ourselves squarely in an intergovernmental position vis-à-vis the USDA. Another is to become more knowledgeable about and engaged in Farm Bill discussions.

Slight amendments will be necessary to expand the Farm Bill to address the needs of Indian Country. It is equally important to realize that the existing treaty obligations which are still relevant today are necessary to stabilize tribal communities and accelerate the ability of tribes to meet their economic, food, infrastructure, and health needs.

INDIAN COUNTRY'S CONSISTENT VOICES IN THE FARM BILL

The Intertribal Agriculture Council (IAC) and the National Congress of American Indians (NCAI) have been the stalwarts of ensuring that Indian Country has a voice in Congress and with the

administration on Farm Bill related issues. The IAC was born out of the 1980’s farm financial crisis, which had unique and devastating impacts on tribal producers. These organizations’ initial policy statements on the 2018 Farm Bill are included in the appendix.

.. _____ x ^ x _____ ..

Every title of the bill is important to Indian Country.

It is critical that their voices are amplified by a chorus of other tribal leaders, organizations, and communities to achieve our goals.

IAC’s early thoughts on the upcoming Farm Bill discussions start with insight about our past.

Agriculture in Indian Country and in other Socially Disadvantaged communities has made tremendous strides in recent versions of the Farm Bill when you consider their meager representation prior to the 1994 Bill. The number of Native producers is up, production is more diversified, participation rates in some Farm Bill opportunities is improved, and we are poised to take the next step; turning our people into food producers and rebuilding our food systems locally, regionally, nationally and internationally.

When dealing with such long ranging policy, there is always room for adjustment in existing policies, in addition to exploring brand new concepts. Thirty years of tireless advocacy, effort, and conversations with and on behalf of our Native producers informs the following recommendations.

Our initiatives for consideration in this and future Farm Bills are reflective of our formative documents; used to capture the landscape, barriers, and opportunities in Indian Agriculture in the mid 1980s. There were several areas of emphasis covered in that document, but they can be summarized in two general categories: fair access to credit, and improvement of federal services.

First, it must be stated that the IAC is not in favor of an “Indian Title” in the Farm Bill, or in any other legislation that is national in scope and not specifically dealing with Indian Country. We prefer the concept of increased Native American participation intertwined so deeply in every program and service throughout the government that it would not only take a concerted effort to unravel it, it becomes second nature for all service providers to think, “what is the Native American point of view on this?” This also guides our approach to our Farm Bill priorities.

First and foremost, the linkage between farm policy programs to feed the hungry, be they overseas, or United States citizens must be maintained by keeping them

tied together in the Farm Bill. When this discussion is held, too often, we forget that in addition to feeding those in need, SNAP, WIC, FDPIR, and even the overseas hunger efforts, all serve as the price support structure for the American agriculture economy.

Parity for Livestock Producers. It hasn’t been until recently, that livestock producers have been thoughtfully included in Farm Bill discussions and programs. As a result, there is considerable room for improvement. What makes this especially important is that the very nature of their business not only

results in a lack of income when commodity prices are down, their borrowing power proportionately reduced, as a function of their equity base being erased by forces outside of their control. Where crop producers often own the land and equipment used in production, assets

with a somewhat stable appreciation or depreciation trajectory, that isn’t tied so closely tied to the market; livestock producers not only depend on livestock prices as their main source of income, their ability to borrow operating capital for production expenses or expansion is directly and inextricably linked to these prices.

.. ———— x ^ x ———— ..

Most USDA programs haven’t even begun to be seriously utilized by tribes because, for the most part, we are invisible in those relevant Farm Bill sections authorizing the programs. But we need to act now to change that.

Crop producers have access to ACRE, Counter-Cyclical Payments, and Loan Deficiency Payments, not to mention Federal Crop Insurance, to manage their risk from market fluctuations and production losses. Livestock producers have a very limited set of tools in their risk management toolbox. Most of those tools come at an upfront price. Crop growers have the luxury of being a premium their proper insurance products after the harvest, which enables them to avail themselves of this tool at no actual cost. We seek the same latitude for livestock producers.

It is often challenging to convince underserved, and higher risk, populations to participate; as a result, a “socially disadvantaged” subsidy rate should be established, which would increase the willingness of insurance providers to seek them as customers.

The IAC regularly assists producers with FSA loans for livestock production. Both direct and guaranteed loans force a state-determined planning price to develop cash flows. When this projected price is above what is realized, through no fault of their own the producer’s plan is no longer viable and they become “distressed.” Loan deficiency payments could assist with this and prevent considerable numbers of defaults while saving countless hours of staff time in restructuring.

A pilot project that would develop a congruent set of tools for livestock producers should be a part of this Farm Bill. Existing risk management tools for livestock producers should have premium payments deferred until production is known, as federal crop insurance is. In addition, the subsidy rate should be higher for Socially Disadvantaged Groups to improve their participation in risk management opportunities. Many Native producers are horse owners. For many of these producers, horses are the income source from property under their control. Growing horses is a permitted livestock operation under tribal law in these cases, and should be treated as agriculture by the USDA for the purposes of lending, risk management, value added agriculture, and disaster assistance. We can draw a parallel to floriculture if needed to illustrate how broad the interpretation can be.

According to the National Congress of American Indians (NCAI):

Agriculture is a major economic, employment, and nutrition sector in Indian Country. The 2012 U.S. Department of Agriculture Census of Agriculture counted at least 56,092 American Indian-operated farms and ranches on more than 57 million acres of land. These farms and ranches sold \$3.3 billion of agricultural products, including more than \$1.4 billion

of crops and \$1.8 billion of livestock and poultry.¹¹ **Additionally, the 2007 Census of Agriculture Fact Sheet notes that, “American Indian farm operators are more likely than their counterparts nationwide to report farming as their primary occupation...to derive a larger portion of their overall income from farming...[and] to own all of the land that they operate.”**¹² As a result of the huge agricultural footprint across Indian Country and the fact that more than 35 percent of American Indian and Alaska Native peoples live in rural communities,¹³ tribal governments and farmers look to active partnerships throughout the US Department of Agriculture (USDA) to sustain and advance common interests across the broad array of services that this federal agency provides to tribal governments.

Programs at USDA span a wide range of areas that have an impact on Indian Country, including food safety, housing, business development, telecommunications and broadband, water systems, crop insurance, nutrition, land conservation, forestry, research, and of course the programs designed to assist farmers. In FY 2012, Rural Development and the Rural Utility Service together funded investments totaling more than \$190 million in Indian Country, with approximately half of that in the form of loans and loan guarantees. As such, tribal governments look to the myriad of services, programs, and resources available from the USDA to ensure sustained prosperity and economic security to American Indians and Alaska Natives — not only through its programs to farmers and ranchers, but also through programs that serve tribal governments, natural resource managers, youth, colleges, water infrastructure providers, tribal utilities and housing providers, and tribal communities.¹⁴

In 2013, NCAI also published recommendations for Farm Bill engagement, stating:

The support provided through the Farm Bill has long been recognized as holding many opportunities to create sustainable, resilient, and land-based jobs while providing food and economic resources for our nations and supporting

*our youth and educational opportunities. Important concepts that should control Farm Bill discussions from the Indian Country perspective include **parity, opportunity, and consistency.***

Parity requires that legislation and funding for USDA programs and services include tribal governments at the same level as states and counties in the delivery of meaningful food and agriculture, nutrition, health and education programs. **Opportunity** is what the Farm Bill should provide to Indian Country through tribal support and incentive programs as well as a statutory requirement to the USDA to focus the provision of all USDA services and programs to Substantially Underserved Trust Areas. **Consistency** is needed in programs and funding to ensure tribal governments can establish long-term plans and goals for their communities. Funding for some tribal programs at USDA over the last few years – especially in the economic development programs – has been reduced and then consolidated into broader, non-tribal-specific programs. Given the expense and effort it takes to ensure tribes know about USDA programs and are taking advantage of them, it creates a bad shell game to take away tribal-specific programs or move such funding into a general program where tribes must compete.

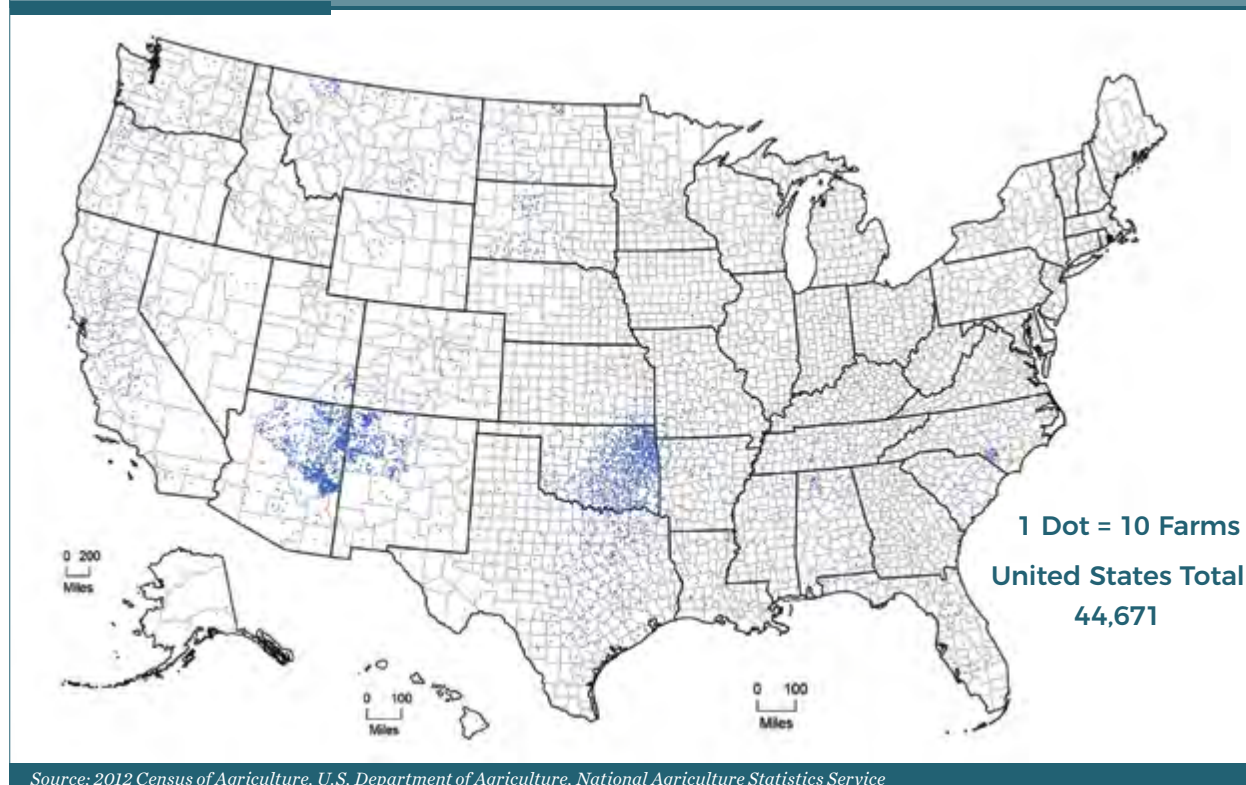

*Agriculture reforms are needed to encourage and support the continued development of Indian Country food and agriculture resources. Reforms in the Farm Bill and in the USDA implementation of farm programs will assure that tribal resources can be optimized in the food and agriculture sector in ways that will support sustainable economic development, which means jobs. Without reforms, Indian agriculture will lack the support necessary to continue its development and the ability of existing tribal food and agriculture businesses to grow and reach new levels of success and prosperity will be affected.*¹⁵

2012 AMERICAN INDIAN AND ALASKA NATIVE FARMS AND RANCHES Total Value of Production

	American Indian or Alaska Native Operators	All Farms
Market value of products sold	\$3.3 billion	\$395 billion
Crop sales	\$1.4 billion	\$212 billion
Livestock sales	\$1.8 billion	\$182 billion
Average per farm	\$59,398	\$187,097

SALES OF CROPS AND LIVESTOCK BY COMMODITY GROUP On American Indian Operations, 2012

TITLE I: COMMODITIES

Commodity policy is set in Title I. A commodity is generally defined as “a raw material or primary agricultural product that can be bought and sold.”¹⁶ This title provides programs for farmers who produce corn and other feed grains, wheat, rice, soybeans and other oilseeds, peanuts, and pulses crops (dry peas, lentils, chickpeas), dairy, sugar, and cotton. Historically, these have been known as “staple” crops and were generally considered to be crops whose abundance was important to national and, in some cases, global food security. In the early years of the Farm Bill, most federal farm policy was focused on these important crops. When agriculture became more mechanized and farmers began producing more of these staple crops, the economics (supply and demand) for such crops became volatile for farmers. Market fluctuations, the Great Depression, and the Dust Bowl were among the major factors that led to a shift in federal farm policy and passage of the Agricultural Adjustment Act of 1933, which began modern commodity policy.

Today, Title I focuses on income assistance and market attention and is passed with an eye towards U.S. trade goals and obligations under the World Trade Organization. Agriculture production provides a key trade balancing function for our overall economy. Even in times of great economic volatility, the trade of agriculture commodities in the global marketplace can have a stabilizing effect on the overall U.S. economy. Most countries throughout the world have some policies in place to protect their own farmers and encourage the growth of their own agriculture systems. Most trade deals include some degree of negotiations surrounding agriculture and commodities issues.

Under the most recent 2014 Farm Bill, income assistance to farmers is only provided in cases of significant yield losses in an area or deep price-based losses. Cotton was eliminated as a program crop. Dairy was transitioned to a margin protection program, and livestock producers were given additional protections. Spending on Title I programs is far less in recent years than it has been historically, and for the last decade, spending has

been less than one-quarter of one percent of the federal budget.

In the 2014 Farm Bill, the commodity programs were adjusted in numerous ways. Congress tried to respond to public sentiment to repeal several programs related to farm program payments. Direct payments to farmers were repealed while transition payments to cotton producers remained. Counter-cyclical payments were repealed and average crop revenue programs were as well. Alternative or replacement programs were created in the form of price loss coverage (PLC) and agriculture risk coverage (ARC) programs. Programs in this title provided support for upland cotton producers and created marketing assistance loans for covered commodities and for wool, mohair, and honey producers. Non-recourse loans, marketing allotments and other provisions were provided for sugar producers and the title also covered sections related to dairy. Upland cotton producers became eligible to participate in a new cotton crop insurance program under Title XI (Crop Insurance) which is the Stacked Income Protection Plan (STAX), and cotton producers receive transition payments under the law while the new crop insurance program is created. The payment limitations and the adjusted gross income limitations were amended under this title. Marketing Assistance Loan Programs are kept in place and the sugar program was left unchanged. Program participation in Title I can be very complex.

Title I of the Farm Bill provides very detailed Congressional direction to protect and support many key commodity crops grown in the U.S., and even goes so far as to identify market prices which link to the actual benefits that farmers receive when the market price shifts. In other words, the law specifies the market value at which the protection programs kick in when the market price falls below the congressionally established rate. This title creates the concept of “base acres,” which ties the producer to a set acreage over which program participation extends. Producers may choose individual or county-level farm revenue as the foundation for their participation in the ARC program.

Tribes participating in these programs must do so with a very deep understanding of the market, their costs of production, and the wide variety of risks they face. For tribes and Native producers who regularly produce commodity title covered crops or who participate in the commodities farm programs, a thorough analysis of Title I programs should be conducted every year. That analysis should take place alongside an analysis of crop insurance needs and a further adjustment of business plans and strategic outlooks to properly manage risk and market access.

When tribes are impacted by drought or other weather-related conditions, their knowledge of and participation in both the Title I programs and crop insurance can spell the difference between weathering the storm or failure of the business. All tribes or individual tribal members who suffer livestock and forage losses due to drought or other weather-related circumstances need to act to ensure they attempt to recoup those losses. And equally important, each tribe or individual Native producer who anticipates they will engage in commodity programs must ensure that their land base production is included in the USDA program records, because it provides the basic building for inclusion in the commodity programs. Some tribes have done this effectively and efficiently over the years, while other tribes are just learning the processes. Currently, some tribes are engaging in new relationships with USDA to ensure that all their applicable acreages are included in such programs (as appropriate) and are entering into cooperative agreements that ensure applicable tribal land records are transitioned into the program records as effectively and efficiently as possible.

Payment limitations (i.e., limiting of levels of program funding that can be received by those using the farm programs) are set in the 2014 Farm Bill at

\$125,000 for everyone “actively engaged in farming” but with specific limits for individual program participation. A spouse may receive an additional \$125,000. A separate \$125,000 limit is provided for payments for peanuts under these programs. Cotton transition payments are limited to \$40,000 per year. Benefits under the federal crop insurance program and the new 2014 Farm Bill-created Supplemental Coverage Option (SCO) and the Stacked Income Protection Plan (STAX) program for upland cotton producers have no payment limitations. The limit on eligibility to receive farm program benefits no longer distinguishes between farm and nonfarm income. Under the single adjusted gross income (AGI) limit, any individual with an annual AGI above \$900,000 (including nonfarm income) is ineligible to receive

farm program payments under commodity or conservation programs.¹⁷ Again, tribes and individual tribal producers participating in Title I farm programs must keep an eye on the payment limitation provisions of current and

any future Farm Bills as many voices within farm policy debates have targeted payment limitations for years in efforts to ensure that those engaged in farming with the highest need for such assistance are actually the ones receiving some.

After significant debate on the House floor, the Sugar Program that was passed in the 2008 Farm Bill – including the feedstock flexibility component in the Energy Title – was reauthorized until 2018 without changes.

On dairy, the 2014 Farm Bill continues the move away from subsidy programs and towards risk management programs for dairy producers, such as the margin protection program. Producers must choose margin coverage levels, as well as make premium payments. The Margin Protection Program (MPP) for dairy producers introduces a margin insurance program that provides benefits to

.. ————— x ^ x ————— ..
That analysis should take place alongside an analysis of crop insurance needs and a further adjustment of business plans and strategic outlooks to properly manage risk and market access.

dairy producers when the difference between milk prices and feed costs falls below a target margin. The Dairy Product Donation Program (DPDP) requires the Secretary of Agriculture to purchase dairy products at market prices for donation to nutrition programs whenever the margin between milk prices and feed prices falls below the minimum margin specified under the MPP. The Dairy Product Price Support Program (DPPSP) and Dairy Export Incentive Program (DEIP) were repealed. The Milk Income Loss Contract (MILC) Program was extended retroactively to October 1, 2013, and remains in place until the MPP is operational, but no later than September 1, 2014. By offering an insurance-based program to dairy producers, they were able to choose coverage levels based on their willingness to pay for risk protection.

Although the bill does not reauthorize the Supplemental Revenue Assistance Program (or SURE) present in previous farm bills, it retroactively reauthorizes the disaster assistance programs that were in the 2008 Farm Bill, and makes them permanent. So, the Livestock Indemnity Program (for livestock losses from adverse weather or attacks

by federally reintroduced animals), the Livestock Forage Disaster Program (for losses resulting from drought or fire), ELAP – Emergency Assistance for Livestock, Honey Bees and Farm-Raised Fish (assistance for losses not covered in the two previous programs), and the Tree Assistance Program (protection for orchardists and tree growers against plant diseases, insect infestations and natural disasters) are all now permanent programs.

Livestock Indemnity and the other disaster programs made permanent are very important to Indian Country farms and ranches, since more than half of all income from agriculture in Indian Country comes from livestock production. In addition, retroactive coverage of losses incurred in fiscal years 2012 and 2013 assisted producers affected by both the historic 2012 drought and the October 2013 blizzard in South Dakota. Finally, the issues surrounding Country of Origin Labeling (COOL) regulations remained in place and were extended to include venison (Title XII). COOL labeling issues are extremely important for tribal herds and tribal livestock programs that wish to distinguish their products in the marketplace.

WHY SHOULD INDIAN COUNTRY CARE?

First and foremost, regardless of which side of the debate you are on commodity price and income support programs, COOL, or payment limitations, the reality is that there are many tribal governments and tribal farming, ranching and food businesses that are already engaged in producing covered commodity crops of wheat, corn, soybeans, and are deeply engaged in livestock operations impacted by the livestock provisions of Title I. This means that Indian Country, writ large, cannot turn its back on those among us whose very food and agriculture businesses hinge on the continued presence of these programs. What we can be concerned about is that these programs are equitably accessible by tribal producers and that our voices are heard as the programs are discussed and either amended or reauthorized.

Second and equally important, many of the tribal lands that are leased to non-Native producers or other Native producers are engaged in the production and raising of these crops and livestock. The income derived from such leases is inextricably intertwined with the prices our lessees ultimately receive for these crops and livestock sales.

.. ———— x Λ x ———— ..

The reality is that there are many tribal governments and tribal farming, ranching and food businesses that are already engaged in producing covered commodity crops of wheat, corn, soybeans, and are deeply engaged in livestock operations.

According to NCAI (in a 2013 document discussion of Farm Bill recommendations):

Commodity Programs provide income or other types of support (“safety net”) to farmers that grow the major commodity crops — wheat, corn, soybeans, cotton, and rice. The title includes programs to help farmers manage production risks, including volatile weather and natural disasters, as well as market fluctuations.

With a growing investment in crop insurance that is mandated by lending agents, tribal agriculture relies on the risk-based programs in this title to recover from environmental and climate changes that affect agriculture production. Many tribal governments engage in the food and agriculture sector through the ownership and operation of farms and ranches, either directly as branches of their tribal government or through related business enterprises. Many of these farms and ranches are and have been the recipient of farm program payments, crop insurance subsidies, livestock indemnity payments, disaster payments, conservation cost-share payments and related programs known as “farm subsidies.” Indian Country cares and supports that those programs be maintained, because the most significant and most successful tribal farms and ranches are regular recipients of the benefits of

AMERICAN INDIAN FARMS AND RANCHES Income Statement Sheet		
	2007	2012
Market value of products sold	\$3.2 billion	\$3.2 billion
Government payments received	\$90 million	\$90 million
Total production expenses	\$2.9 billion	\$2.9 billion
Net cash farm income	\$513 million	\$371 million
Average net cash income per farm	\$8,351	\$6,632

Source: U.S. Department of Agriculture National Agriculture Statistics Service

those programs. Through those programs, jobs are created on reservations and Indian land base and the natural resources are maintained, improved, and protected. Many tribes have built strong and resilient agricultural production businesses, but need continued access to farm program payments and other safety net programs to ensure the continued growth and vitality of those businesses in volatile market situations and natural disasters.¹⁸

EXAMPLES OF OPPORTUNITIES IN THE COMMODITY TITLE

Supplemental Agricultural Disaster Assistance Programs – Definitions

An amendment to the definition of “eligible producer on a farm” in Section 1501(a)(1)(B)(iv) should be made to include an individual tribal member, tribal government, or other tribal entity that assumes the production and market risks associated with the agricultural production of crops or livestock and to include in the definition of entities a “corporation, limited liability corporation, or other farm organization structure organized under state or tribal law. This will acknowledge the authority of organizations organized under tribal law.

The list of included “livestock” (Section 1501(a)(3)) already includes many of the livestock raised by tribal producers, like horses, but does not include such species as “reindeer,” “caribou,” “elk,” or other livestock commonly raised in tribal communities.

Livestock Indemnity Payments

Under Section 1501(b)(1), payments may be made from Commodity Credit Corporation (CCC) funds to eligible producers who have incurred livestock death losses above the normal mortality rate if they are caused by attacks from animal reintroduced into the wild by the federal government or protected under federal law or “adverse weather.” The payment rates included under Section 1501(b)(2) are set at a rate of 75 percent of the market value of the applicable livestock on the day before the date of death. This section should be amended to allow for 90 percent loss rate coverage for tribal-owned livestock to address the lack of land equity that exists for tribal producers, with the exception of allotted lands. This heightened rate of loss coverage is also needed due to the unique challenges tribal livestock producers have in obtaining secure markets for their animals, thus causing a generally lower rate of market return for their livestock.

Livestock Forage Disaster Program

Under Section 1501(c), covered livestock includes most circumstances reflecting the ownership or control of livestock by tribal producers. However, the terms under which “eligible livestock producer” are covered under the disaster program may not cover every possible circumstance under which tribal producers engage in either livestock ownership or through which they participate in leases of their lands, as managed or controlled by the Bureau of Indian Affairs. The instances relating to “normal carrying capacity” (also a requisite for participation in the program) may inadvertently

2012 TOP CROP ITEMS, RANKED BY ACRES On American Indian Farms and Ranches		
	FARMS	ACRES
Forage	15,514	1,169,253
Winter wheat for grain	1,141	371,074
Corn for grain	1,968	305,398
Soybeans for beans	1,613	257,909
Spring wheat for grain	206	148,393

Source: U.S. Department of Agriculture National Agriculture Statistics Service

exclude some tribal producers if the Bureau of Indian Affairs does not negotiate or recognize the specific environmental or other variances which impact production. For these reasons, an additional (F) section should be included in the program that ensures that all tribal producers remain or become eligible to participate in the forage disaster loss program. Possible language could include:

“Nothing contained in this section, nor in actions of the Secretary implementing the livestock forage disaster program shall exclude the participation and coverage conditions relating to tribal producers, tribal livestock production, tribal forage lands, and the Secretary of Agriculture and the Secretary of Interior shall ensure that USDA and the Bureau of Indian Affairs (respectively) implement regulations coordinated in such a way that ensures full tribal producer landowner participation in the program. In addition, the Secretary shall ensure that the lack of appropriate drought monitoring or weather monitoring equipment on tribal lands is not an impediment to the participation in the program and shall use such funds as are available under the CCC to provide weather monitoring capabilities on tribal lands throughout the United States.”

Eligibility can be readily determined by Indian tribes.

Finally, due to the unique challenges facing tribal livestock and forage producers, all other provisions of the program shall ensure that payment rates are set at 90 percent levels (as opposed to any lower rates identified in the law for non-tribal producers).

Farm Service Agency County Committee

Farm Service Agency (FSA) County Committee determinations on normal grazing periods and drought monitor intensity should be amended to ensure that separate carrying capacities and normal grazing periods for each type of grazing land or pastureland are set at different rates for tribal lands and are established by the national office of the Farm Service Agency (not at the county committee level).

Further, such determinations must be established at rates that are reasonable and appropriate to tribal lands, not to the county lands that fall under the jurisdiction of the county committees. In addition, changes to normal carrying capacity or normal grazing periods related to tribal lands should be established also by the national Farm Service Agency headquarter offices and not by state or county officials. These rates should be established after tribal consultation and must be established after discussions with the Bureau of Indian Affairs as well. All payments that eligible livestock producers who own or lease lands may be entitled to under the program that are within tribal jurisdiction should be controlled by the national headquarter Farm Service Agency offices and not by the state or local (county) officials.

Additionally, any losses due to fire on “public managed land” while included in the program for coverage are only allowed if the losses are on rangeland that is managed by a federal agency and the producer is prohibited by the federal agency from grazing the normal permitted livestock numbers on the managed rangeland due to fire. Tribal producers should not be interpreted to be affected by this section as their lands are not “public” lands.

The makeup of county committees has been contentious for many decades. Many FSA county committees and the local administration areas around the country do not reflect their membership of the race, national origin, sex, or other characteristics of the producers and landowners eligible for FSA programs within the county. In fact, there are many counties which are predominately made up of Native American citizens that don’t have any Native people voted onto the committee because they are not systematically included in the balloting and nomination process. Because county committees wield so much power over the implementation of commodity and other programs (e.g., credit) relating to production and lands within the county, a new approach is needed to ensure that tribal representation is required on county committees. To do so, FSA should be

required to do an assessment based on Census data and Agricultural Census data to determine the population makeup of the county, and should be required to devise a way, in consultation with tribal governments, to ensure that tribal members are effectively and efficiently notified of the opportunity to be nominated and considered for county committee membership. FSA should require all county committees in predominately tribal population areas and/or tribal land base areas be predominately Native in membership. While this is equally important to many other populations around the country, not enforcing this requirement within the county committee context is a direct violation of the federal trust responsibility. Some FSA county committees have already moved in that direction, but ensuring that all remaining committees accomplish this goal is necessary.

Emergency Assistance for Livestock, Honey Bees, and Farm-Raised Fish

Under Section 1501(d), additional assistance is made available from no more than \$20 million in CCC funds for emergency relief to eligible producers of livestock, bees, and farm-raised fish. These losses can be due to disease, adverse weather, blizzards, wildfires, or other conditions (in addition to drought or fire covered elsewhere). The section should be

amended to require that the Secretary ensure that all tribal land owners or tribal producers are fully eligible to participate in this program.

Trees

Additional assistance is created for tree owners in Section 1501(e). Under this provision, tribal producers should be made eligible for 80-90 percent of the cost of replacement, salvage, pruning, removal, or preparing the land or replanting to ensure that the higher cost of providing these remediation activities on tribal lands is accommodated within the limitations of the program and tribal governments, tribal business entities organized under tribal law and tribal producers should all be recognized as “legal entities” and “persons” allowed to participate in the program.

Rulemaking Related to Significant Contribution for Active Personal Management

Section 1604 concerning the passage of regulations related to “active personal management” or “active engagement in farming/ranching” should be amended to recognize that tribal producers, tribal business entities, and tribal governments should not be excluded from any determination of “active personal management/engagement” simply by the

existence of an active lease relating to their lands. Instead, the Secretary (through Farm Service Agency) should be required to engage in tribal consultation concerning the application of this requirement to tribal producers. Such consultation – as required under Executive Order 13175 and federal law – must also involve the Bureau of Indian Affairs (BIA), and must also include relevant tribal organizations knowledgeable of these issues as well as tribal elected officials from each BIA region. The purpose of this consultation and subsequent unique requirements is to ensure that tribal producers and entities are not adversely affected when passing regulations related to all other producers.

Geographically Disadvantaged Farmers and Ranchers

Section 1606 regarding “Geographically Disadvantaged Farmers and Ranchers” was amended in 2014 by changing the effective dates of the provisions from 2009 through 2012 to 2009 and each succeeding fiscal year. Section 1621 of the 2008 Farm Bill (Food, Conservation, and Energy Act of 2008) created a program through which

geographically disadvantaged farmers or ranchers could receive direct reimbursement payments for transportation of an agricultural commodity, or inputs used to produce an agricultural commodity occurring over a distance of more than 30 miles. Authorization of such payments was not allowed to exceed \$15 million per fiscal year. While “insular areas” were explicitly covered in the program, this section should be further amended to ensure that tribal governments, tribal entities, and tribal producers are explicitly recognized as farmers or ranchers eligible to participate in the program.

Base Acres

Finally, as to the determination and election of “base acres” applicable to all programs under the Commodity Title, a provision requiring that the Secretary ensure, upon consultation with tribal elected officials by the Farm Service Agency, that base acre regulations not adversely affect tribal producers, tribal governments, or tribal entities involved in agricultural operations who elect to participate in programs covered under the Commodity Title.

TITLE II: CONSERVATION

As noted previously, conservation was one of the primary purposes of the original Farm Bill through incentives created to allow farmers to cut back on their acreage during periods of extreme weather conditions. Starting in the Dust Bowl days of the 1930s, the United States Department of Agriculture (USDA) and what was to become the Natural Resource Conservation Service (NRCS) organized and worked with locally led Soil and Water Conservation Districts to help farmers with terraces, shelterbelts, and other conservation techniques. In the 1950s, a “soil bank” was created to put the most highly erodible ground back into grass or other conservation uses. In the 1970s, new authorities were created to help farmers as other laws like the Clean Water, Clean Air, and the Endangered Species Acts came into existence. Spending on conservation programs has grown to roughly \$5 billion per year. These programs are important tools for farmers, because conservation practices often do not translate to profit. From its desperate beginnings in the Dust Bowl, the NRCS has worked with farm families to create the most sustainable and efficient agricultural industry in history.

The 1985 Farm Bill created, for the first time, a Conservation Title with the Conservation Reserve Program (CRP) and the Wetlands Reserve Program (WRP). Since 1996, the Conservation Title has focused more on working lands cost-share assistance through programs such as the Environmental Quality Incentives Program (EQIP), the Wildlife Habitat Incentives Program (WHIP), and the Conservation Security Program (CSP). The Conservation Title did sustain cuts in the 2014 Farm Bill. In every Farm Bill since 1985 – 1990, 1996, 2002, and 2008 – the investment in conservation has increased. The size of the cut in the 2014 bill exceeds the gains from the 2008 bill, but still shows a substantial investment in conservation practices. However, the investment is not likely enough to keep up with the nation’s conservation needs.

In general terms, the 2014 Farm Bill streamlined and merged several of its previous programs, resulting in about \$6 billion in savings over 10 years. The

Congressional Budget Office estimates that between Fiscal Years 2014 and 2018, mandatory spending on USDA conservation programs will decline by \$200 million – less than 1 percent of the \$28 billion that would have been spent if the 2008 Farm Bill programs continued through 2018. All major conservation programs, except for Conservation Technical Assistance, have mandatory funding. The Conservation Reserve Program (CRP) acreage cap was reduced to 24 million by 2017. Current enrollment has fallen to 25.6 million acres, and up to 2 million acres of grassland can be enrolled. Funding for the Environmental Quality Incentives Program (EQIP) and the Conservation Stewardship Program (CSP) is increased. The Wildlife Habitat Incentives Program is repealed, although 5 percent of EQIP funds will be set aside for habitat-related practices.

The new Agricultural Conservation Easement Program (ACEP) consolidates the Wetland Reserve Program, Grassland Reserve Program, and the Farmland Protection Program, and now has just two conservation components: Agricultural Land Easements and Wetland Reserve Easements. However, funding for the program is just over half of what was provided for these three programs in the 2008 Farm Act. The new Regional Conservation Partnership Program (RCPP) is designed to coordinate conservation efforts across states and various programs to solve problems that must be addressed on a broader scale. RCPP consolidates functions of the Agricultural Water Enhancement Program, Chesapeake Bay Watershed Program, Cooperative Conservation Partnership Initiative, and the Great Lakes Basin Program.

The final 2014 Farm Bill retains the existing cost-share differential for beginning, limited resource, and socially disadvantaged producers in the Environmental Quality Incentives Program (EQIP), and increases the amount of an EQIP contract that a farmer can receive in advance from 30 to 50 percent. This advance payment can be used to cover the up-front costs of a project for the purposes of purchasing materials or contracting services, which is crucial for many new farmers with limited cash flow. In addition, the 2014 Farm Bill also maintains a 60 percent allocation for livestock production, retains the existing set-asides of dedicated funding for beginning and socially disadvantaged farmers both within EQIP and the Conservation Stewardship Program, and expands these conservation incentives to include veteran farmers. The conservation loan program is retained and increases the guarantee rate for a conservation loan to 90 percent for beginning and underserved farmers (on par with other federal farm loan programs) and 80 percent for other borrowers. The final bill also increases funding for the Conservation Reserve Program—Transitions Incentives Program (CRP-TIP), which incentivizes retiring landowners to rent or sell their farmland to beginning and socially disadvantaged farmers. This program was established in 2008, and due to high demand, ran out of program funding in 2012. Military veteran farmers will also be newly eligible for this program.

The 2014 Farm Bill included \$10 million for wetland banking so that producers who drain and fill wetlands can buy credits to partially mitigate environmental degradation. Producers whose actions impacted wetlands are able to receive crop insurance subsidies without having to mitigate prior actions taken to drain or fill wetlands, and producers who receive federally subsidized crop insurance are required to self-certify that they comply. Importantly, the 2014 Farm Bill added tribes as eligible entities to cooperate and participate in the Soil and Water Resource Conservation Act, which provides assessments and planning for the conservation and enhancement of soil, water, and natural resources. In the past, USDA has worked

with NCAI to gather input from Tribal Nations on conservation issues, as well as to identify barriers to tribes' participation in conservation programs.

This Conservation Title also aided producers and landowners to adopt conservation activities on agricultural and forest lands designed “to protect and improve water quality and quantity, soil health, wildlife habitat and air quality.” These practices are based on technical standards. The conservation title programs are designed to address working lands, forestlands, grasslands, and wetlands, and to protect natural resources on those lands. Provisions within the title also allow for permanent land retirement. Under previous law there were 23 different programs focused on conservation, and the 2014 Farm Bill lowers that level to 13.

Conservation Reserve Program continues financial assistance to producers who meet stewardship requirements on agricultural and forest lands. The 2014 Farm Act raised the requirements for CSP enrollment to meeting the stewardship threshold for two resource concerns.

Noneasement functions of the **Grassland Reserve Program**, created under previous Farm Bills, is now carried out through the Conservation Reserve Program and grassland enrollment of up to 2 million acres is authorized.

Crop Production on Native Sod Program is for producers who choose to till native sod, and would reduce crop insurance premium subsidies and limit the yield or revenue guarantee available during the first four years of crop production on native sod that had not been previously tilled. The new provision applies only to native sod in Minnesota, Iowa, North Dakota, South Dakota, Montana, and Nebraska.

Environmental Quality Incentives Program continues financial assistance for producers to install and maintain conservation practices on eligible agricultural and forest land. **The Wildlife Habitat Incentive Program**, created under previous Farm Bills, was merged into the Environmental Quality

Incentives Program, with at least 5 percent of funds set aside for wildlife habitat-related practices.

Agricultural Conservation Easement Program is a new program that was created to allow for permanent easements for restoration and protection of on-farm wetlands and to protect eligible agricultural land from conversion to nonagricultural purposes. ACEP consolidates the previous Wetlands Reserve Program, the easement portion of the Grassland Reserve Program, and the Farmland Protection Program. Land enrolled in those programs will roll over to the new ACEP but the funding for the new ACEP is significantly reduced.

Regional Conservation Partnership Program is designed to coordinate conservation program assistance within regions to solve regional-level problems. The RCPP consolidates the previous Agricultural Water Enhancement program, the Chesapeake Bay Watershed Program, the Cooperative Conservation Program, and the Great Lakes Basin Program.

Conservation of Private Grazing Lands Program was extended until 2018.

Comprehensive **Conservation Enhancement Program, Emergency Forestry Conservation Reserve Program, and the Environmental Easement Programs** created under previous Farm Bills were repealed.

Grassroots Source Water Protection Program was extended until 2018.

Voluntary Public Access and Habitat Incentive Program, while extended until 2018, was also required to conduct a study of the effectiveness of the program. However, from the beginning of the program, the bulk of activities were conducted through state agencies and organizations and, as such, the ability of tribal governments to take full advantage of the program to improve the access of the public to their lands was not fully incorporated into the framework of the program. This lessened the program's effectiveness on tribal lands and in some cases, ensured that tribal lands were not incorporated into the original purpose of the program.

Agriculture Conservation Experience Services Program, while mentioned in the 2014 Farm Bill, was clarified in terms of requiring that Conservation Reserve Program funding could not be used for the Agriculture Conservation Experience Services Program.

Small Watershed Rehabilitation Program was extended until 2018.

Terminal Lakes Assistance, a new program included in the 2014 Farm Bill, sought to clarify the use of the funds for waters with no natural outlet that are prone to flooding, requiring federal assistance.

Soil and Water Resource Conservation Act program was amended to include tribes in most aspects.

The 2014 Farm Bill adds crop insurance premium subsidies to the list of benefits that could be withheld for noncompliance with conservation provisions, thus maintaining farmer incentives for environmental stewardship. Producers who fail to apply approved soil conservation plans on highly erodible cropland or who drain wetlands could become ineligible for all or part of several agricultural programs, including commodity programs, conservation programs, disaster assistance, and now crop insurance premium subsidies. In recent years, the value of such subsidies rose sharply along with the premium subsidy rate, crop insurance participation, and commodity prices.

WHY SHOULD INDIAN COUNTRY CARE?

The lands within Indian Country are in significant need of intensified conservation practice implementation. Yet, even with multiple efforts across previous Farm Bill negotiations, the NRCS conservation program portfolio still needs attention so that the programs and authorities can be more effective on tribal lands. It is well known that NRCS programs that are based on the granting of conservation easements will not work on tribal lands, as the Bureau of Indian Affairs will not approve of the granting of easements on these unique lands. That issue was tackled in previous Farm Bills but allowing, instead of an easement, that the landowner could enter into a 30-year agreement to gain access to the conservation-cost share programs available under NRCS authorities granted in the Farm Bill. However, even granting 30-year agreements (for the imposition of approved cost-share practices), significant acres of tribal lands are still in dire need of conservation project

implementation. This is complicated further as some lands which fall under Bureau of Indian Affairs jurisdiction are limited to lease terms of only 25 years. Some of this need arises from the reality that most of the known landowners must sign off on the creation of these conservation projects. Due to the

numbers of highly fractionated interest in the land, and the number of fractionated landowners who live off tribal lands, such requirements can be almost impossible to execute and accomplish.

In 2013, NCAI issued a list of recommendations for future Farm Bills and included key provisions related to conservation:

Conservation legislation provides for environmental stewardship of farmlands and improved management practices through a range of land retirement and/or working lands programs, among other programs geared to farmland conservation, preservation, and resource protection. Working lands programs include: Environmental Quality Incentives Program (EQIP) and Conservation Stewardship Program (CSP). Land retirement programs included: Conservation Reserve Program (CRP) and the Wetlands Reserve Program (WRP), among others.

Tribal governments have proven their efficient administration and use of funds for their natural resource programs. Surrounding economies also benefit from the leadership and commitment of tribes toward stewardship of natural resources. Conservation programs are known to stabilize the agricultural economies of state and local governments, and inclusion of tribes in these programs would leverage tribal expertise and develop rural economies both on and off tribal lands.

However, not all conservation programs or funding is available to tribal governments even though such programs and funding are available to state and local governments.

.. ———— x ^ x ———— ..
The lands within Indian Country are in significant need of intensified conservation practice implementation.

In addition to the suggested language below, the Natural Resources Conservation Service should be encouraged, either through direct legislative language or in manager's report language, to continue its work in ensuring that tribes are involved in developing traditional ecological knowledge-based (TEK-based) technical standards for implementation of conservation programs on tribal lands and that sufficient funds are set aside at each field office in the NRC agency to address conservation needs in Indian Country. Finally, special attention should be paid to ensure that in the efforts to provide protection to endangered or threatened species through utilization of WHIP program funds, that critical funding to improve habitat for subsistence species upon which many rely as their food sources is maintained.

Congress should expand parity and access to federal conservation programs by amending the Soil and Water Resource Conservation Act to include tribal governments in the conservation programs that currently only include state and local governments. By explicitly including tribes in programs that already exist for state and local governments, tribal governments and tribal economies can reach parity and support the surrounding economies.

The result would enhance cooperation among all governments managing rural lands and result in streamlined approaches for better use of federal resources to enhance economic development and create jobs. The recommended provisions provided below allow for the building of tribal technical capacity and include tribes in the Soil and Water Resource Conservation Act programs. State and local governments have historically benefited from this assistance while tribes have been excluded.

Amend the Soil and Water Resource Conservation Act, 16 U.S.C. §2001 et. seq. as follows Subtitle F – Other Conservation Programs Section 2607. Indian tribes should be given access to all programs within the section as on an equal basis as other entities. The effect of this overarching section is shown below with the new language in bold italics.

Amend the Soil and Water Resource Conservation Act, 16 U.S.C. §2001 et. seq. as follows: § 2003 Congressional policy and declaration of purpose...

(b) Full utilization of cooperative arrangements with state and tribal agencies. Recognizing that the arrangements under which the federal government cooperates with state and tribal soil and water conservation agencies and other appropriate state and tribal natural resource agencies such as those concerned with forestry and fish and wildlife and, through conservation districts, with other local units of government and land users, have effectively aided in the protection and improvement of the Nation's basic resources, including the restoration and maintenance of resources damaged by improper use, it is declared to be the policy of the United States that these arrangements and similar cooperative arrangements should be utilized to the fullest extent practicable to achieve the purpose of this chapter consistent with the roles and responsibilities of the non-federal agencies, landowners and land users. (c) Attainment of policies and purposes The Secretary shall promote the attainment of the policies and purposes expressed in this chapter by—.... (2) developing and updating periodically a program for furthering the conservation, protection, and enhancement of the soil, water, and related resources of the Nation consistent with the roles and program responsibilities of other federal agencies and state, tribal and local governments. §2004 Continuing appraisal of soil, water, and related resources (a) Data. In recognition of the importance of and need for obtaining and maintaining information on the status of soil water, and related resources, the Secretary is authorized and directed to carry out a continuing appraisal of the soil, water, and related resources of the Nation. The appraisal shall include, but not be limited to... (4) data on current federal and state, and tribal laws, policies, programs, rights, regulations, ownerships, and their trends and other considerations relating to the use . . . (b) Collection of data. The appraisal shall utilize data collected under this chapter and pertinent data and information collected by the Department of Agriculture and other federal, state, tribal and local agencies and organizations. The Secretary shall establish an integrated system capable of using

combinations of resource data to determine the quality and capabilities for alternative uses of the resource base and to identify areas of tribal, local, state, and national concerns and related roles pertaining to soil and water conservation, resource use and development, and environmental improvement. (c) *Public participation.* The appraisal shall be made in cooperation with conservation districts, state and tribal soil and water conservation agencies, and other appropriate citizen groups, and tribal, local and state agencies under such procedures as the Secretary may prescribe to insure public participation. § 2005. *Soil and water conservation program (a) Program development.* The Secretary is hereby authorized and directed to develop in cooperation with and participation by the public through conservation districts, state, tribal and national organizations and agencies, and other appropriate means, a national soil and water conservation program (hereinafter called the “program”) to be used as a guide in carrying out the activities of the Secretary which assist landowners and land users, at their request, in furthering soil and water conservation on the tribal, private and non-federal lands of the Nation. The program shall set forth direction for future soil and water conservation efforts of the United States Department of Agriculture based on the current soil, water, and related resource appraisal developed in accordance with section 2004 of this title, taking into consideration both the long- and short-term needs of the Nation, the landowners, and the land users, and the roles and responsibilities of federal, state, tribal and local governments in such conservation efforts. The program shall also include but not be limited to — (1) analysis of the Nation’s soil, water, and related resource problems; (2) analysis of existing federal, state, tribal, and local government authorities and adjustments needed; (3) an evaluation of the effectiveness of the soil and water conservation ongoing programs and the overall progress being achieved by federal, state, tribal and local programs and the landowners and land users in meeting the soil and water conservation objectives of this chapter; (4) establishing a Cooperative Working Agreement with Tribal Conservation Districts to staff a District Coordinator position to do outreach and assistance to tribes, and tribal member farmers and ranchers. §

2008. *Utilization of available information and data.* In the implementation of this chapter, the Secretary shall utilize information and data available from other federal, state, tribal and local governments, and private organizations and he shall coordinate his actions with the resource appraisal and planning efforts of other federal agencies and avoid unnecessary duplication and overlap of planning and program efforts.¹⁹

EXAMPLES OF OPPORTUNITIES IN THE CONSERVATION TITLE

Equivalent USDA and BIA Conservation Plan

A new section of the Conservation Title should be created that specifically states that a Conservation Plan prepared under the auspices of the Natural Resources Conservation Service shall be the equivalent of and required to be accepted by the Bureau of Indian Affairs (BIA) as fully accepted for any BIA requirement of an environmental assessment of tribal lands (either owned or under the jurisdiction of a tribal government) for purposes of implementation of an Agricultural Resource Management Plan under the American Indian Agricultural Resources Management Act of 1993 and any regulations implementing such Act or any subsequent amendments to said Act.

Recognition of Traditional Ecological Knowledge-Based Conservation

A new section of the Conservation Title should be created that explicitly allows a tribe or a group of tribes within a state or region to develop traditional ecological knowledge-based technical standards and those standards shall control the implementation of all conservation projects allowed under the Farm Bill. This new section would codify current NRCS practices and would further recognize the fact that tribal jurisdiction and use of traditional practices to improve conservation project implementation are decisions best left to the tribal governments and organizations that live on those lands and are engaged in ongoing activities that are designed to

improve environmental conditions on the ground, improve habitats, and improve their lands for agricultural purposes. These traditional ecological knowledge-based standards already have a solid scientific basis and are acknowledged by various federal research organizations and agencies.

CRP Land Availability for Beginning Tribal Farmers and Ranchers

A new section of the Conservation Title should be created that will allow the use of CRP land or other lands engaged in conservation practices to be used by tribal members who are beginning farmers and ranchers in ways that do not damage the conditions of the land or resources.

Include Tribal Priorities in Definition of Priority Resource Concerns

The definition of “Priority Resource Concerns” in Section 1238D(5) should be amended to include any natural resource as determined by the Secretary that is identified at the national, state, tribal or local level as a priority for a particular area of a state or tribal area.

Allow Lands Held in Common and by Tribal Entities to Access Conservation Programs

A new section of the Conservation Title should be created to ensure that lands held in common, such as those lands on certain reservations that are controlled and farmed/ranched by groups of individuals can participate in all Conservation Title programs and that special provisions are enacted in regulations to ensure that any tribal government-allowed entity is the recognized conservation program participant (as opposed to specific individuals).

Priority for Enrollment of Tribal Lands in the Conservation Reserve Program

Section 2001 of the 2014 Farm Bill establishes priorities for the Secretary to consider when implementing the Conservation Reserve Program and Conservation Priority Areas. Due to the prolonged periods that tribal lands have been under-enrolled in conservation programs and due to the needs of those acres and watersheds to have focused

attention on enrollment in conservation programs and utilization of conservation practices on those lands, all tribal lands falling under the jurisdiction of the Bureau of Indian Affairs, tribal governments, tribal agricultural entities, and individual tribal producers and landowners or land operators, should receive mandatory priority consideration for all conservation programs authorized in the upcoming Farm Bill. Further priority will be given to beginning farmers and ranchers seeking to establish or re-establish working lands activities on tribal lands and commercial activities related to the re-establishment of working lands or the emergence of beginning farmers and ranchers who are tribal members utilizing those working lands.

In any ranking activity conducted by NRCS officials to determine which lands or resources to enroll in a conservation program allowed under this title, the Secretary and/or state conservationists or technical committees (state or tribal) shall give priority to tribal lands for enrollment in relevant programs, provided these lands or resources also meet requirements for inclusion in the programs.

Notice Regarding Conservation Activities

All conservation activities occurring on tribal lands utilizing any of the Conservation Title programs should be required to ensure that knowledge of enrollment and conservation practices has been provided to all parties (Bureau of Indian Affairs, the lessee and lessors of the land, and tribal governments), and that all parties are given an opportunity to concur in the practice. In addition, such conservation activities will be required to be in conformance with the tribal governments' Agricultural Resource Management Plan, if one is in place.

Recognizing Tribal Law Parity

Within the Conservation Title, any reference to "state law" shall be amended to say "state law or tribal law" and any reference to "state technical committee" shall be amended to reflect "state technical committee or tribal technical committee."

Tribal Technical Committee

Each State Conservationist shall be required to establish a separate tribal technical committee should any tribal headquarters exist within their state boundaries or any land under the jurisdiction of tribal governments or the Bureau of Indian Affairs. These tribal technical committees shall be given the same respect and deference that is currently given to the state technical committee and each tribal technical committee shall be able to establish separate technical standards utilizing

traditional ecological knowledge and, to the extent that they do so, such standards shall be the technical standards under which conservation programming can be deployed on tribal lands.

No Additional Compensation for Expired Conservation Measures

When a conservation practice installed on tribal land or lease/permit expires, no individual tribal member or tribal government or tribal entity shall be required to compensate the former lessee of the tribal lands for the installation or maintenance of such practice since those practices have already been the subject of cost share with the federal government. Any further payment to lessees or users of the lands would constitute a windfall or unjust enrichment to such user of the land.

.. _____ x ^ x _____ ..

Each State Conservationist shall be required to establish a separate tribal technical committee should any tribal headquarters exist within their state boundaries or any land under the jurisdiction of tribal governments or the Bureau of Indian Affairs.

NRCS Report on Natural Resource Inventory Investments Needs on Tribal Lands

The USDA-NRCS shall immediately develop a report to be delivered to the Bureau of Indian Affairs and made public to all tribal governments identifying which tribal lands are still in need of a proper Natural Resource Inventory investment of funding support to create a baseline of needs for said lands.

Traditional Ecological Knowledge Consideration for Conservation Compliance

Traditional ecological knowledge shall be considered whenever the Secretary determines the level of compliance of landowners who have lands or resources enrolled in any of the Conservation Title programs, particularly when determining whether a meaningful stewardship threshold has been reached.

BIA Actions Responsible for Non-Compliance

No tribal landowner or operator of lands shall be determined to be in violation of any term of a conservation program enrollment requirement when the Bureau of Indian Affairs can be established as the cause for any alleged non-compliance, whether through delay in action, other non-action in decision-making requirements, or any other reason.

Tribal Priority in EQIP

In addition to the 5 percent tribal set-aside, priority consideration should be given to tribal governments, tribal entities, and tribal landowners and operators to participate in EQIP program activities. This priority shall be widely advertised throughout each state in which the lands are located and each tribal headquarters in the state shall receive notice of all activities related to the EQIP program. Tribal landowners and operators shall be entitled to additional priority for any activities related to organic and organic transition practices on their

farms and ranches. Each tribal government shall be invited to at least two meetings with the state conservationist in a government-to-government conversation concerning the implementation of NRCS conservation programs that could be beneficial to tribal lands. When requested by tribal headquarters, the state conservationist shall enter into cooperative agreements and other activities that will establish a plan by which NRCS programming will be deployed on tribal lands for which the tribal government has an ongoing plan for conserving and protecting habitat, grasslands, rangelands, and other lands and land uses within tribal jurisdiction. The state conservationist shall communicate directly with the relevant regional and national BIA offices in tandem with tribal headquarters to ensure that the maximum efficiency and effectiveness be utilized in the implementation of conservation programs on tribal lands.

Tribal Parity in the Conservation Title

All sections of the Conservation Title should include a provision allowing tribal governments, tribal

producers, and tribal entities or organizations created for conservation and natural resource protection purposes to have full access to every program allowed under the Conservation Title. Wherever reference is made to “state” or “local” or “regional” or agricultural producer, the terms “tribal” shall be inserted into that section to ensure that inadvertent failure to list tribal governments, tribal producers, or tribal organizations does not preclude them from participating or relegate them to a lesser importance or lesser priority or position within the relevant section.

Technical Assistance Funding for Tribal Governments and Organizations

Due to the relatively low use of all conservation programs on tribal lands, the Secretary should be given the authority to create a permanent fund within the available technical assistance funding authorities, appropriations, and programs to ensure that specialized technical assistance is made available on a continual basis to tribal governments, tribal organizations, and tribal landowners and

producers throughout Indian Country, including in all tribal areas of Alaska and Hawaii. These targeted technical assistance funds shall be given priority to tribal organizations that have an established record of providing technical assistance to tribal audiences and shall demonstrate their knowledge of and ability to successfully complete projects involving conservation programming with tribal audiences. The funding shall not be provided to predominately non-Native organizations with little to no experience and knowledge of working with tribal audiences. Multi-year cooperative agreements should be authorized under such technical assistance programs.

Alternative Funding Arrangements – EQIP and CSP

The 2014 Farm Bill allowed for entering alternative funding arrangements with tribal governments to carry out the intention of the EQIP program and the Conservation Stewardship Program. The Secretary had the authority to enter into such alternative arrangements if he determined that the goals and objectives of the law would be met by such arrangements and that statutory limitations on entering arrangements with individual producers would not be exceeded. This provision needs more attention and improved implementation to ensure that each tribal government is offered the opportunity to be provided alternative arrangements. This is necessary to ensure that the decades of lack of conservation programming on Indian lands is ameliorated and improved.

Tribal Conservation Technical Committee

Finally, the Secretary should be authorized to work with Bureau of Indian Affairs and a technical committee made up of tribal government representatives from each of the BIA regions to formulate a set of initiatives and programs that can be carried out under existing laws as well as a set of programs that may be needed under future conservation program authorities to improve the conditions of tribal lands throughout the United States. This interdepartmental entity shall be put in

place no later than 12 months after the passage of the 2018 Farm Bill and shall issue its report no later than 24 months after passage of the 2018 Farm Bill. The interdepartmental efficiencies and improvements shall be undertaken immediately upon the issuance of the interdepartmental report and annual reports of improvements and actions taken under this provision shall be made to Congress.

IAC’s recommended changes in the Conservation Title include:

Conservation Reserve Program: A pilot program to explore the use of livestock to improve soil health in fields set aside by the Conservation Reserve Program, and allowing for a rental rate over and above the CRP payment to be made to the producer is needed. A growing body of science demonstrates the impact that a lack of animal impact can have on the soil. This program would seek to determine the impacts and benefits, for further developing in subsequent iterations of the Farm Bill or conservation legislation. Preference in the use of this land would be afforded to first to SDR producers, Young and Beginning Producers, and then to customary producers. The more need that is met through the rental agreement, the smaller the reduction in CRP Payment.

Beginning producers in Conservation Programs: A beginning producer focus should occur within all conservation programs. All beginning producers should be encouraged and allowed to participate in conservation programs and all conservation programs should be amended to incentivize beginning producers.

Rollback CSP program to 2013 standards: The CSP program 2013 standards are more appropriate for use and should be adopted for use now.

Next Generation Easement: Conservation programs should incorporate a new “next generation easement.” This “easement” should incorporate tax credits for landowners who are mentoring new and beginning producers and should include a death tax “write-off” for farm transfer to the next generation.

According to NCAI, the Conservation Title should also:

- **Fund the Environmental Quality Incentives Program (EQIP) at least \$1.6 billion as required by the 2014 Farm Bill.**
- **Fund the Conservation Stewardship Program (CSP) at a minimum of \$1.449 billion.**

Between FY 2010 and FY 2011, the Natural Resources Conservation Service (NRCS) saw an 85 percent increase in tribal participation in its programs, which could be attributed to USDA's outreach to tribal governments. Specifically, NRCS has assisted with the establishment of more than 30 Tribal Conservation Districts by working with the Intertribal Agricultural Council (IAC) and Indian Nations Conservation Alliance (INCA). In 2016, NRCS's Regional Conservation Partnership Program provided more than \$27 million for conservation programs where tribes were the lead, which have led to dozens of partnerships between tribal, state, local, and private entities in mostly rural areas.

American Indians and Alaska Natives hold their natural resources as sacred and depend heavily upon them for economic, cultural, and spiritual sustenance. Historically, federal natural resources funding for tribes has been limited, as tribes are ineligible for dozens of federal natural resource programs. Other funding for tribal natural resource programs under Bureau of Indian Affairs' appropriations consistently experiences the smallest budget increases of all the Department of the Interior bureaus. While working to sustain essential efforts amidst the harsh budget

climate and potential cuts to funding, tribes should have access to new opportunities afforded by USDA's NRCS programs. The 2008 Farm Bill authorizes the Secretary of Agriculture to provide up to 90 percent of the costs associated with planning and implementing conservation practices for tribes. In addition, up to 30 percent of such payments may be provided in a short-term advance for purchasing materials or contracting. Tribes are also included in the five percent set-aside of Environmental Quality Incentives Program (EQIP) funds and the five percent set-aside of Conservation Stewardship Program acres for socially disadvantaged farmers or ranchers. Since the Wildlife Habitat Incentives Program was rolled into EQIP in the 2014 Farm Bill, NCAI requests that the funding levels continue to steadily increase for EQIP, which provides financial and technical support to tribes and others to install or implement structural and management conservation practices on eligible agricultural land.

The Conservation Stewardship Program (CSP) is another vital program in the NRCS. The CSP provides crucial help in reducing soil erosion, enhancing water supplies, improving water quality, increasing wildlife habitat, and reducing the damage caused by floods and other natural disasters. Funding this program at \$1.466 billion is necessary to cover technical and financial assistance needed for a full enrollment of the acres authorized by Congress. The CSP is an important resource for tribes, as tribal participation has been increasing over the years with a 172 percent increase from FY 2010 through FY 2011, with 246 contracts to tribes totaling \$10.4 million.²⁰

TITLE III: TRADE

Whether it is between countries or between tribes, trade is essential to agriculture. Tribes have a long, well-established practice of trading food, agriculture products, and goods of all kinds. Our intertribal trade routes and traditions are preserved in our oral and written histories predating the creation of the United States. When the United States was created, most of the early commercial activity among the colonies and early states was centered around agriculture and food. That predominance of food and agriculture trade continues to today and many agriculture groups are significantly involved in, supportive of, and concerned about all issues related to trade in food and agriculture products.

Most of the jurisdiction of trade matters for purposes of the Farm Bill and food and agriculture products today lies in other committees of Congress, such as the U.S. House Committee on Ways and Means and the U.S. Senate Committee on Finance, but trade issues are also discussed within Title III of the Farm Bill. In the 1960s, 1970s, and 1980s, a series of programs were developed for humanitarian and trade development purposes, and these have been amended in Title III of recent farm bills. The Food for Peace Program is the primary means by which we ship U.S. staple commodities to those most in need in the world, which serves diplomatic, humanitarian, and market development purposes.

Title III also includes a Market Access Program (MAP) to support and establish U.S. branded goods established in foreign markets, and provides various credit authorities for making sales in certain foreign countries. All Title III programs are discretionary accounts funded by yearly appropriations.

Tribes have participated in MAP for many years. The program is administered by the Intertribal Agriculture Council through the American Indian Foods Program and provides export readiness training and assistance for the export presence of American Indian food products and incorporation of those products into international food trade shows. This highly successful program has ensured that tribal food products are made known to emerging food markets around the world.

Tribes have expressed general support for many of the other programs authorized in the Trade Title, including: the Food for Peace Act & Food for Peace Program; the McGovern-Dole International Food for Education and Child Nutrition Program;

the Local and Regional Procurement Program, the Export Credit Guarantee Program; the Foreign Market Development Program; the Emerging Markets Program; the Technical Assistance for Specialty Crops Program; the Agricultural Trade Act of 1978; the Foreign Market Cooperator Program; and other Agricultural Trade Laws important for the creation and sustaining of markets for American food products. Tribes engaged in the Market Access Program with the Intertribal Agriculture Council see

the benefit to their food systems and agriculture production at food trade shows around the world.

.. ——— x Λ x ..

Whether it is between countries or between tribes, trade is essential to agriculture. Tribes have a long, well-established practice of trading food, agriculture products, and goods of all kinds. Our intertribal trade routes and traditions are preserved in our oral and written histories predating the creation of the United States.

WHY SHOULD INDIAN COUNTRY CARE?

New food products developed by tribes can have tremendous early success by engaging in foreign markets first, particularly those in the Pacific Rim countries and European Union countries. Demand

for tribal agricultural and food products is high in many foreign markets and is likely to continue improving over time as the global desire for unique food products continues. Many tribal food businesses have had or are currently experiencing much success by engaging in trade. However, the hurdles necessary to engage in such markets are very complex. IAC's work in promoting trade by tribes in foreign markets ranges from coordinating export readiness trainings for those wishing to engage in foreign markets to coordinating tribal food business engagement in foreign trade and food shows.

In 2013, NCAI expressed the following recommendations regarding the Trade Title:

The Trade Title provides support for U.S. agricultural export programs and international food assistance programs. Major programs include: The Market Access Program (MAP) and the primary U.S. food aid program, the P.L. 480 program, and other programs. Additionally, Title III addresses program changes related to World Trade Organization (WTO) obligations.

Tribal Perspective: Under the Market Access Program (MAP), Commodity Credit Corporation (CCC) funds are used to support the cost of overseas marketing and promotional activities for non-profits, state, tribal and regional organizations, cooperatives, and small businesses on a cost-share basis. The Food, Conservation, and Energy Act of 2008 set mandatory funding for the MAP at \$200 million annually through Fiscal Year 2012. For FY 2014, it is imperative that the MAP be reauthorized and funding remain level or exceed prior funding to support the Administration's export goals, as well as the export of United States agricultural products. Equally important to Indian Country is continuing the financial support provided by the MAP program to tribal agriculture via the

.. ——— x X x ——— ..

New food products developed by tribes can have tremendous early success by engaging in foreign markets first, particularly those in the Pacific Rim countries and European Union countries.

Intertribal Agriculture Council (a participant in the MAP program) to support the increasingly successful Native export activities and ensure continued successes in exporting – and the related growth in jobs for American Indian and Alaska Native agriculture.

Marketing and Promotion; Market Access Program (Foreign Ag Service): Fix for the Market Access Program in Foreign Ag Service to allow IAC to focus on solely American Indian produced food products. The present

MAP agreement between IAC and FAS is authorized through: (Conference Report, Sec. 122. Marketing Assistance Program [MAP], c. Eligible Trade Organizations, page 1014) “The Senate Bill defines eligible trade organizations to include U.S. or regional agricultural trade organizations that promote but do not profit directly from specific sales of agricultural commodities; a private organization that contributes significantly to U.S. export market development; or a tribal or inter-tribal organization that promotes the export and sale of one or more Native American products.” The intent of this language needs to be strengthened by stating in law that “a tribal or intertribal organization that promotes the export and sale of one or more trademark certified Native American products.”²¹

EXAMPLES OF OPPORTUNITIES IN THE TRADE TITLE

Study on Tribal Representation on USDA Advisory Bodies

The Secretary should be required to study all Trade Title programs to ensure that tribal representatives are included on all advisory bodies related to agricultural trade issues and concerns.

Tribal Representatives on U.S. Trade Missions

Tribal governments and tribal food businesses should be included on all trade missions undertaken by the United States to foreign governments to further assist tribal food products' access to such markets.

Expand MAP

Expand MAP by substantially increasing the funding available to the Intertribal Agriculture Council to coordinate and administer the program for tribal audiences so that more tribal food and agriculture businesses can benefit from the program. The impact of such engagement will further solidify local food economies and food businesses and stabilize tribal economies.

Interdepartmental Coordination to Support Tribal Trade

A special interdepartmental coordination group should be seated to include USDA, Department of Commerce, Department of State, and other

applicable agencies to ensure that tribal food production is properly supported and encouraged on tribal lands and is thereafter made a part of the U.S. trade missions and efforts to promote agricultural trade. The responsibility for coordination must extend beyond USDA Foreign Agriculture Service and other USDA programs to other applicable departments and agencies of the federal government.

Supporting Unique Tribal Foods and Fighting Native Food Fraud

Non-tribal organizations should not be allowed to participate in MAP who focus solely on American Indian food readiness. Food fraud is on the rise throughout the world and unscrupulous food business entities are already trying to mimic or replicate unique tribal food products. Those businesses should not be allowed to participate in programs that allow them to access markets with products that perpetrate frauds on tribal food producers or food businesses.

TITLE IV: NUTRITION

The Supplemental Nutrition Assistance Program (SNAP), originally called Food Stamps, was created in the early 1960s and made permanent by Congress in 1964 as part of the Johnson Administration’s War on Hunger and was included in the Farm Bill in 1973. SNAP and other feeding and nutrition programs are, by far, the largest component of the current Farm Bill, and make up almost 80 percent of all mandatory spending. Eligibility for SNAP benefits are generally based on a formula of income and asset qualification tests for either vouchers, cash assistance, or in some cases, packaged food product delivery. Participation in the programs changes annually. In FY 2014, approximately 46.5 million Americans were receiving SNAP benefits, averaging \$125 per person per month.

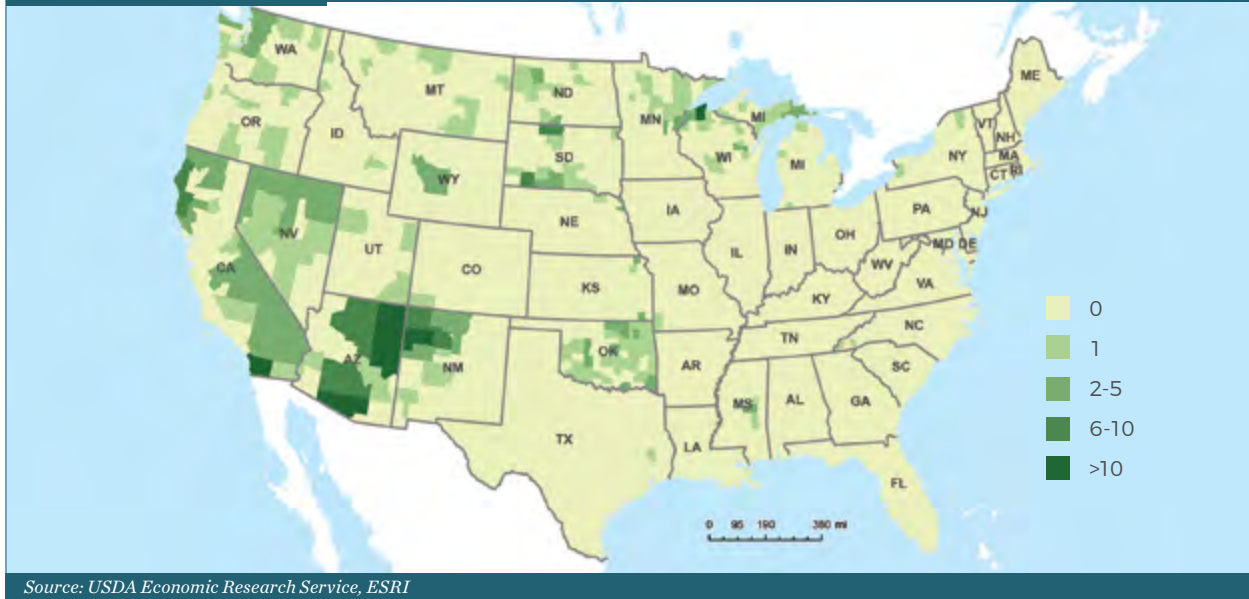

The 2014 Farm Bill reauthorized SNAP, the nation’s largest food and nutrition assistance program, maintaining the program’s basic eligibility guidelines while restricting access to an income deduction that increased benefits for some households. Additional SNAP funding for enhanced employment and training activities, increased healthy food options, and expanded anti-fraud efforts was also provided in the bill.

In addition to SNAP there are several other feeding programs providing key nutrition and food access to citizens across the country. These programs include: the Restaurant Meals Program; Nutrition Education and Obesity Prevention Grant Program; the Food Distribution Program on Indian Reservations (FDPIR); the Emergency Food Assistance Program; the Commodity Supplemental Food Program; the Senior Farmers Market Nutrition Program; the Fresh Fruit and Vegetable Program; the Food Insecurity Nutrition Incentive Program; the Healthy Food Financing Initiative; and the Agriculture Service Learning Program. Within the Commodity Supplemental Food Program portfolio is the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) and other programs which rely on commodity food purchases and deliveries.

The 2014 Farm Bill authorized USDA to support **Healthy Food Financing Initiative (HFFI)** projects to provide healthy food retailers with grants and loans to “overcome the higher costs and initial barriers to entry in underserved areas.” Priority is given to an HFFI project that “supports regional food systems and locally grown foods, to the maximum extent practicable.” HFFI was also authorized to receive up to \$125 million in appropriated funds; whether HFFI receives additional funding or not would be a function of future annual agriculture appropriations bills. The former Farm Bill also prioritized healthy food access projects that involve

FOOD DISTRIBUTION PROGRAM ON INDIAN RESERVATIONS SITES, 2012

direct-to-consumer sales marketing, provide locally or regionally produced fruits or vegetables, and are located in underserved communities.

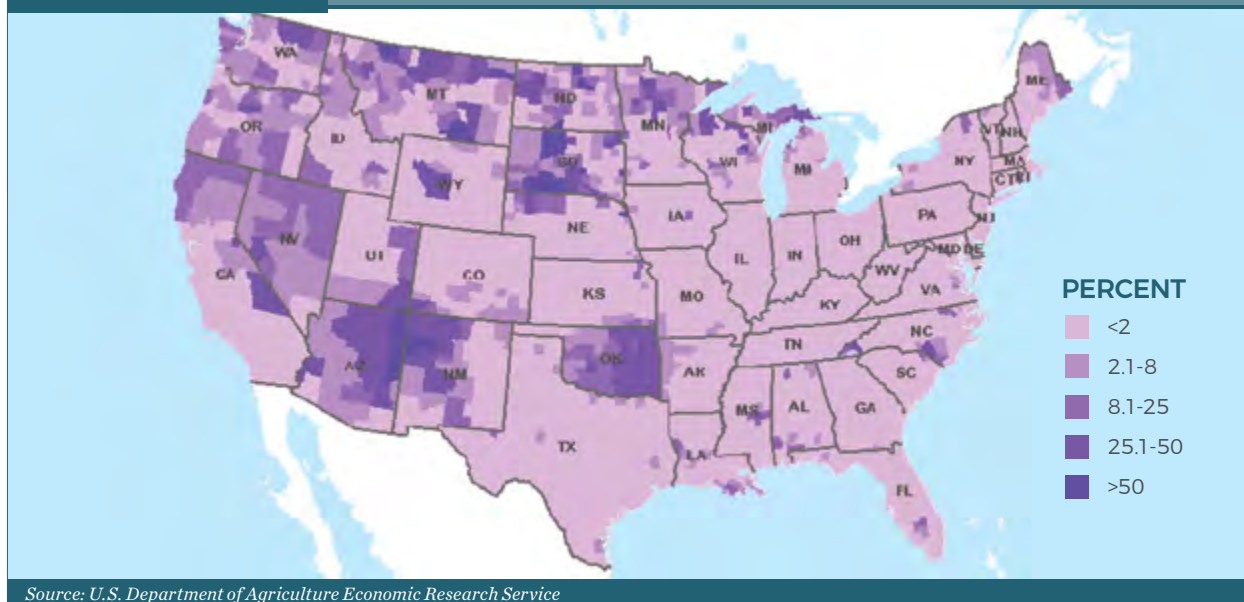

Each Farm Bill has tried to improve feeding programs. These changes can include tightening or loosening eligibility requirements; improving program administration; tackling specific issues embedded within some or all of the programs; or adding new requirements in attempts to either diminish or increase the number of individuals who can utilize the programs. Many of these changes are specifically tied to economic conditions in the country; other changes are undertaken as specific attempts to impose policy changes that would either restrict growth of the programs or tie program usage to social or economic situations that individual participants might face. Often the programs are amended to achieve nutrition goals, and many times the changes are tied to updates to the federal dietary guidelines which drive most, if not all, decisions made by USDA Food and Nutrition Service (FNS) concerning the reach and scope of these programs.

The 2014 Farm Bill included changes to provisions attempting to increase employment requirements of SNAP recipients and tying participation to work requirements or employment training. The bill provided funding to develop and test methods

to increase employment of SNAP recipients and imposed new requirements to evaluate and regularly report on outcomes of State SNAP Employment and Training Programs. Other changes involved increasing healthy food options for SNAP participants by requiring a larger variety of food options at authorized retailers and establishing a grant program to provide incentives to SNAP recipients who purchase fruits and vegetables. The 2014 Farm Bill also sought to enhance the integrity of SNAP by using improved information technologies to expand efforts to combat fraud and verify participant eligibility and income. SNAP Employment and Training Program pilot projects were authorized and provided \$200 million in funding for up to 10 states to focus on increasing the employment and earnings of recipients.

SNAP NATIVE AMERICAN PARTICIPATION, 2010

The Food Insecurity and Nutrition Incentive grant program (FINI) was authorized and funded at \$100 million over five years with an additional \$5 million per year through 2018 and was designed to provide federal matching funds to entities providing food in communities that would encourage SNAP recipients to purchase fruits and vegetables. SNAP's eligibility requirements in the 2014 Farm Bill were left unchanged with states allowed to coordinate (under federal guidelines) SNAP eligibility requirements with other safety net programs.

The 2014 Farm Bill also creates a Multiagency Task Force in Section 4205 whose purpose is to provide coordination and direction for commodity programs. The task force is to be led by FNS, and includes Agriculture Marketing Service, Farm Service Agency, and Food Safety Inspection Service. The task force is required to review and make recommendations regarding procurement specifications of food commodities; the efficient and effective distribution of food commodities; and the degree to which the quantity, quality, and specifications of procured food commodities align with the needs of producers and preferences of recipient agencies.

INDIAN COUNTRY SPECIFIC PROVISIONS

Several key provisions in the 2014 Farm Bill applied specifically to tribal citizens participating in one or more of the federal feeding programs. Tribal citizens appear throughout the participation portfolios of each of the discrete feeding programs, because tribal citizens live throughout the country, not just on tribal lands. It is important to examine: (1) how tribal citizens are affected within each of the feeding programs; (2) how tribal-specific programs or Farm Bill provisions are carried out and what remains to be done; and (3) the effectiveness of the Nutrition Title in serving the needs of tribal citizens located in both urban environments, where approximately 70 percent of all Native people reside, and within rural, reservation, remote, and isolated communities which are normally within the land base of Indian Country.

Tribal Administration of Feeding Programs: Section 4004

Tribal governments have, over many years, passed resolutions supporting the migration of federal feeding programs to tribal management and administration. The 2014 Farm Bill called on the Secretary of Agriculture, after consultation with tribes, to release a report on the potential for tribes

to administer federal food assistance programs that benefit their citizens. A majority of these programs are currently administered by the states. The study was to be finished no later than 18 months after final enactment of the Farm Bill and would include: a list of programs, services, functions and activities which can be administered by tribes and tribal organizations; if a statutory or regulatory change was necessary to allow for tribal administration; and issues raised during tribal consultation. The Secretary was required to make \$1 million available for funding the report.

The study and report was completed and published July 2016.²² Generally speaking, the findings of the study were as follows:

- Nearly all tribes participating and more than 90 percent of all respondents expressed interest in administering federal nutrition assistance programs as an expression of sovereignty and to provide direct service to tribal members in need of assistance and felt the ability to provide flexibility in the management of nutritional quality of the food provided and culturally appropriate programming and services were critical.
- There was interest in managing programs that were larger and more complex by large and medium tribes. Some tribes did not wish to administer all school-related programs while most tribes expressed interest in either some component of school-related programs in addition to programs focused on after-school, fresh fruits and vegetables, and senior farmers' market programs.
- Almost three-quarters of the tribes who responded have experience in program administration of key components such as program outreach, determining participant eligibility, producing reports and delivering services to program participants. Tribes also

reported key experience in developing and using governance policies to guide implementation, experience in financial governance polices, program compliance, integrity and reporting. Most tribes also have key experience in financial, program operation and reporting issues in both electronic and web-based reporting systems.

Key challenges identified in the study include:

- **Lack of financial resources.** Tribes identified the need for specific administrative contract costs to be identified and transferred when the program administration functions were transferred to tribal governments. Likely startup and administration costs will need to be included, but this issue is no different than state costs for administering the same programs.
- **Merit system personnel regulations.** While this is not an issue for most tribes who have long-established merit system personnel regulations that guide their own internal hiring systems, the improvement of such systems will be important for some tribes when taking over the administration of these programs. Current SNAP law requires that entities administering SNAP must ensure that state agency staff conducting certification interviews are employed in accordance with standards determined by the Office of Personnel Management (merit system). The 2018 Farm Bill should address this requirement specifically to ensure this issue does not create an impossibility for tribal management.
- **Infrastructure needs.** Tribes indicated that they had insufficient technological and physical infrastructure to administer additional federal nutrition programs.
- **Need for technical assistance and competitive EBT pricing as well as other program administration needs.** Tribes indicated that they would need specific technical assistance and

.. ————— x Λ x ————— ..

Tribes identified the need for specific administrative contract costs to be identified and transferred when the program administration functions were transferred to tribal governments.

competitive pricing for administration-related products to ensure proper program management.

- **638 authority.** In addition, the report noted that at this point USDA-FNS does not have the requisite 638 authority that explicitly provides Congressional support for executing contracts between federal agencies and tribes to coordinate the management of specific federal programs. Tribes suggested that legislative language should be inserted into the Indian Self-Determination and Education Assistance Act, Pub. L. No. 93-638, as amended, to include FNS nutrition assistance programs. (Programs administered under Pub. L. 93-638 are often referred to as “638 programs.”) Including nutrition assistance programs in the Indian Self Determination Act would enable tribes to manage federal programs and funding resources in accordance to the needs within their communities. The Act has established standards permitting tribal management of federal programs, using federal funds, in accordance with tribal laws, regulations, and procedures. For example, Subpart F contains provisions relating to financial management, procurement management, and property management. Additionally, 638 programs have less prescriptive regulatory requirements. These requirements focus on minimum standards of performance that must be met in each of these management areas.
- **Development of Tribal Regional Offices.** Tribes suggested that FNS consider the development of tribal regional offices analogous to the existing FNS regional offices. Most federally recognized tribes and villages are concentrated in only a few FNS regions. Tribes suggested that tribal administration of nutrition assistance programs could overtax existing regional offices. Adding tribal regional offices could provide better coverage of the Western and rural areas where tribes are concentrated to help cover this gap.

Traditional Foods

- Tribal governments and advocates have a long history of requesting that the USDA purchase and incorporate more traditional foods into the various feeding programs utilized by tribal

citizens. The 2014 Farm Bill provided the latest version of those policy desires. While USDA has been authorized by Congress over a period of several succeeding Farm Bills to purchase traditional foods, the incidence of such purchases has been sparse and inconsistent. The 2014 Farm Bill authorized a new demonstration project, with technical assistance and tribal consultation, to include traditional and locally grown foods from Native farmers, ranchers, and producers in FDPIR food packages.

- This language is not new, but it embodies the 2014 Farm Bill Congressional authorization to continue to take measures to incorporate traditional foods into the feeding programs. This provision specifically focused on the FDPIR feeding program which is the only program that exclusively serves Native people.
- What is needed now is enshrining the authority for USDA FNS to purchase traditional foods as part of the basic food package and not as “bonus buys” or “special appropriations” buys. More discussion is provided below concerning this important step.
- One or more tribal organizations should be eligible for this demonstration project, which would allow for the purchase of nutritious and traditional foods and, when practicable, foods produced locally by Native producers for distribution to recipients of FDPIR.
- The Secretary was required to perform consultation and provide outreach to Native farmers, ranchers, and producers on training and capacity to participate in the project.
- \$2 million was authorized to be appropriated for each fiscal year from 2014 to 2018 for the demonstration project.

Managers’ Report Statement Regarding Section 4004

The Managers’ Report contained the following language regarding Section 4004: “The Managers recognize that federal regulations and certification requirements can often be burdensome for small producers, especially those on reservations. Often located in remote locations, producers on

reservations may not be close to the Agricultural Marketing Service (AMS) inspectors necessary for certification needed to provide fruits, vegetables, and other agricultural commodities to federal nutrition programs. Costs, including payments for inspector travel time, make certification unachievable for many producers on reservations. As a result, federal nutrition program recipients lose access to locally produced, fresh commodities, and producers lose access to a local market that would assist economic development on reservations. *To address this issue, the Managers encourage the Secretary to work with Tribal Organizations to enable the use of accredited third party certifiers; existing infrastructure on reservations, such as extension agents; or properly trained and certified tribal employees or officers to certify producers on reservations.*”

Little if anything has been done to implement either the language of the law or the Manager’s report.

Traditional Foods: Section 4033

Section 4033 of the 2014 Farm Bill allows for the service of donated traditional foods in residential child care facilities, child nutrition programs,

hospitals, clinics, long-term care facilities, and senior meal programs.

Traditional foods were defined in the provision to include: wild game meat; fish; seafood; marine mammals; plants; and berries.

The section also included a waiver of liability protecting tribes or tribal organizations against any civil actions arising from harm caused by the donation of traditional food.

The section also required USDA and FDA to allow service of such foods “if certain food safety measures are met, which will include meeting measures for food safety in the preparation and processing, labeling and storage of these foods.”

Note: The inclusion of this language concerning food safety requirements, while understandable, created an entirely new set of uncertainties as the application of food safety requirements for traditional foods is changing (e.g., FDA FSMA food safety requirements regarding covered produce) or unknown (e.g., FDA FSMA and USDA FSIS

requirements as to certain types of traditional meat/protein foods).

Commodity Supplemental Food Program: Section 4102

The Commodity Supplemental Food Program (CSFP) was converted to “elderly only” and currently only two tribal organizations operate CSFP: Red Lake and Oglala Sioux.

Senior Farmers Market Nutrition Program

While the Senior Farmers Market Nutrition Program was retained during Farm Bill negotiations, the program was threatened with being merged into other programs and its funding cut in half.

Community Food Projects: Section 4026

Many tribes participate in community-supported agriculture or tribal-supported agriculture activities as a means of improving their communities’ access to healthier foods. This section allowed “tribal organizations” to be eligible for Community Food Project funding.

WHY SHOULD INDIAN COUNTRY CARE?

Tribal citizens have high usage rates of all federal feeding and nutrition programs. In some communities, 25 percent of all community citizens are taking part in the feeding programs. In other communities, the numbers can climb to 60-80 percent of all citizenry. These participation rates hinge on the relative unemployment rates of individuals in the communities, the lack of meaningful employment opportunities, poor transportation options to food sources or food retail, the age and population characteristics of the individuals in the communities, and the prevalence of chronic health problems, among other issues. Because the

.. ———— x Λ x ———— ..
A consistent, comprehensive, and tribal-led approach that is tailored to the needs of Indian Country is paramount.

rate of obesity, diabetes, chronic heart diseases, cancer, and rated health problems is so high in so many communities in Indian Country, participation rates in the feeding programs when coupled with the prevalence of persistent poverty create a fragile system of food access across Indian Country. A consistent, comprehensive, and tribal-led approach that is tailored to the needs of Indian Country is paramount.

Linking or “coupling” the feeding programs to the food production that occurs on tribal lands will do two things simultaneously. First, it will ensure that over time (conceivably less than two decades) the use of feeding programs in Indian Country will precipitously decline and in some regions, could disappear altogether. Second, it will ensure that food produced on Indian lands is focused on three simultaneous goals: (1) retaining enough food products that Indian people will be fed by food produced locally or regionally; (2) ensuring that fresher foods are available to tribal citizens needing access to feeding programs; and (3) ensuring the stabilization of food produced on tribal lands occurs because it is being used to feed people who lack food access and, at the same time, offering a consistent, albeit federal, market and anchor contract providing tribal producers the economic stability to confidently access markets off tribal lands.

Considerable attention has been paid to the Nutrition Title by tribal governments, and in some years, Congress responds by passing language that authorizes small interventions to feeding programs that impact tribal participants. Most recently in the 2014 Farm Bill, several key provisions were included that sought to improve the delivery of several feeding programs to tribal citizens. Those provisions were discussed immediately above. However, key and vexing issues remain that are critical to the future of the feeding programs and how those programs are delivered to or serve Indian Country citizens.

EXAMPLES OF OPPORTUNITY IN THE NUTRITION TITLE

In the 2014 Farm Bill, a Multiagency Task Force led by FNS, and includes AMS, FSA, and FSIS, was created to provide coordination and direction for commodity programs. The Task Force is responsible for making recommendations regarding: the specifications used for procurement of food commodities; the efficient and effective distribution of food commodities; and the quantity, quality, and specifications of procured food commodities to align with the needs of producers and preferences of recipient agencies. While the Task Force has already submitted a report to Congress, it should be reconstituted to engage in consultation with tribal governments to hear from tribal producers and organizations on these important issues. With so many Native communities receiving food from commodity programs, their input into the programs is essential. Scientific studies have shown that traditional foods and foods that are healthier, more nutritious and based on traditional diets of Native people will help alleviate the debilitating effects of diabetes, heart disease, stroke, cancer, and other chronic medical conditions. The Multiagency Task Force cannot just review issues relevant to efficiency, distribution, and the needs of producers and preferences of recipient agencies. It also must incorporate the needs of the recipients of the actual commodities.

There is currently a study underway that examines a comparison of distribution costs, efficiency, and effectiveness of food commodity distribution at the national versus the local and regional level with an eye toward including Native producers and traditional foods in the distribution of

commodities for feeding programs. The study seeks to address the question: Are the needs of Native producers being considered? If the federal government only hears from those who grow, produce, or process commodities that do not come from Native producers or from traditional food sources and never hears from the actual recipients of those commodities, then they are not adequately addressing the ultimate impact on the recipient. The needs of the recipients of the commodity foods should drive these studies and decisions. If

the commodities received are not tailored to the dietary and medical needs of the individuals who are receiving them, then the food production, the commodity purchasing, the commodity distribution, and the purpose of feeding programs that rely on commodity food purchases are entirely disconnected. By coupling all these various segments into a system that achieves more goals, commodity food

distribution systems can go beyond their original purposes of either alleviating hunger or distributing surplus commodities; they can enter a new and more modern age, and become more relevant to health and healthy food access.

Many in Indian Country support a system that connects Native producers and tribally owned food businesses with important anchor government contracts of food purchases that can stabilize our growing food systems and food companies while at the same time feed our people (who right now depend so heavily on these feeding programs). Healthier, more locally and regionally produced, and more traditional foods will in turn improve our health outcomes.

.. ————— x X x ..

If the commodities received are not tailored to the dietary and medical needs of the individuals who are receiving them, then the food production, the commodity purchasing, the commodity distribution, and the purpose of feeding programs that rely on commodity food purchases are entirely disconnected.

Tribal Administration of SNAP and Other Federal Feeding Programs

To build upon the results and tribal suggestions steaming from FNS's feasibility study on tribal administration of federal feeding programs, the next Farm Bill must take the next steps and provide tribes with the authority to do so by expanding 638 authority to USDA nutrition assistance programs.

NCAI has supported the following changes in the Nutrition Title of the Farm Bill:

The Food Distribution Program on Indian Reservations is currently serving approximately 276 tribes that do not have easy access to Supplemental Nutrition Assistance Program (SNAP) offices or authorized food stores. Through 100 Indian Tribal Organizations (ITOs) and five state agencies FDPIR provides USDA foods to low-income households and the elderly living on Indian reservations and to American Indian and Alaska Native households residing in eligible areas near reservations or in Oklahoma. The ITOs also provide employment to local and tribal personnel who administer the program. As the temporary funding increases for SNAP under the American Recovery and Reinvestment expired in October 2013, the demand on FDPIR is increasing, leaving some programs with food shortages. Since FY 2013, FDPIR participation has risen over 17 percent,

and between FY 2015 and FY 2017, the monthly participants have risen from 88,000 to 100,000. Additional funding is needed to address the new demands on the programs, rising food cost – especially the increasing price of protein, and to improve program operations. Further, Congress authorized the USDA to purchase traditional and locally grown foods, but it has been difficult for tribes to create a sustainable supply of traditional foods due to the lack of infrastructure and local capacity.²³

NCAI, in a 2013 report identified the following recommendations for future Farm Bill Nutrition Titles. While some improvements in tribal-specific provisions noted below were made, there is still room for improvement:

The Nutrition Title provides nutrition assistance for households and individuals through programs such as the Supplemental Nutrition Assistance Program (SNAP, formerly known as food stamps), the Food Distribution Program on Indian Reservations (FDPIR), and The Emergency Food Assistance Program (TEFAP), among other types of supplemental nutrition assistance. It also provides support for programs to bring fresh fruits and vegetables to schools and other types of support for child nutrition programs.

Tribal Perspective:

Many American Indian and Alaska Native families rely heavily on federal food assistance programs. Due to high unemployment rates and rural economies, most tribes have limited access to grocery stores, farmer's markets, and community gardens. Historically, these programs have been readily accessible to state and local governments, but high participation rates indicate that tribes should have a larger role in the local procurement and distribution of foods. By encouraging the purchase of more Native-grown product into the feeding programs serving individuals on reservations, the dual purpose of feeding while also creating market opportunities for Indian producers could occur and if allowed to over time, encourage the development of local food and agriculture economies that will alleviate the numbers of individuals on feeding programs while ensuring that local, regional food economies in Indian Country flourish.

1. Expand parity and access to federal food programs. Provide tribes greater access to and control of federal food programs. Of the 15 federal food assistance programs, currently being funded through the Food and Nutrition Services (FNS), tribes are only eligible to administer the Commodity Supplemental Food Program (CSFP), the Food Distribution Program on Indian Reservations (FDPIR), and the Women, Infants, and Child (WIC) program. Since tribes have a duty to protect the welfare of their citizens, it should only follow that tribal governments should identify

and possess greater control of the programs that will meet their needs.

2. Conduct a feasibility study to identify which federal food tribes have the capacity to administer on their own.

Recommended Provisions

INSERT: "(x) In General. – Section 4 of the Food and Nutrition Act of 2008 (7 U.S.C. 2013) is amended by inserting a new subsection (b) and reordering:

"(b) FEASIBILITY STUDY FOR INDIAN TRIBES. – The Secretary shall conduct a study to determine the feasibility of a tribal demonstration project for tribes to administer all federal food assistance programs, services, functions, and activities (or portions thereof) of the agency.

"(c) CONSIDERATIONS. – In conducting the study, the Secretary shall consider –

- "(1) the probable effects on specific programs and program beneficiaries of such a demonstration project;*
- "(2) statutory, regulatory, or other impediments to implementation of such a demonstration project;*
- "(3) strategies for implementing such a demonstration project;*
- "(4) probable costs or savings associated with such a demonstration project;*
- "(5) methods to assure quality and accountability in such a demonstration project; and*

“(6) such other issues that may be determined by the Secretary or developed through consultation with pursuant to subsection (d).

“(d) REPORT. – Not later than 18 months after the date of the enactment of this section, the Secretary shall submit a report to the Committee on Agriculture, Nutrition and Forestry of the Senate and the Committee on Agriculture of the House of Representatives. The report shall contain –

- “(1) the results of the study under this section;
- “(2) a list of programs, services, functions, and activities (or portions thereof) within each agency with respect to which it would be feasible to include in a tribal demonstration project;
- “(3) a list of programs, services, functions, and activities (or portions thereof) included in the list provided pursuant to paragraph (2) that could be included in a tribal demonstration project without amending statute, or waiving regulations that the Secretary may not waive; and
- “(4) a list of legislative actions required to include those programs, services, function, and activities (or portions thereof) included in the list provided pursuant to paragraph (2) but not included in the list provided pursuant to paragraph (3) in a tribal demonstration project.

“(e) CONSULTATION WITH INDIAN TRIBES. – The Secretary shall consult with Indian tribes to determine a protocol for consultation under subsection (b) prior to consultation under such subsection with the other entities described in such subsection. The protocol shall require, at a minimum, that –

- “(1) the government-to-government relationship with Indian tribes forms the basis for the consultation process;
- “(2) the Indian tribes and the Secretary jointly conduct the consultations required by this section; and
- “(3) the consultation process allows for separate and direct recommendations from the Indian tribes and other entities described in subsection (b).

“(f) AUTHORIZATION OF APPROPRIATIONS. – There are to be appropriated such sums as may be necessary to carry out this section. Such sums shall remain available until expended.”

3. Promote and assist the growth and distribution of traditional foods within tribal communities.

Before processed foods entered the diets of American Indians and Alaska Natives, tribal communities lived with lower rates of disease and practiced healthier, physically challenging lifestyles through traditional hunting, fishing, gathering, and agriculture. Tribal governments consistently work to return communities to these traditional practices and foods that encourage healthy living and cultural sustainability. However, the process to create a sustainable supply of traditional foods has been difficult for tribes due to the lack of infrastructure, administrative hurdles, and insufficient technical assistance to build tribal capacity. To build capacity and restore traditional practices tribal governments recommend that Congress:

- Institute a traditional food market within FDPIR.
- Provide technical assistance to increase capacity of traditional and local farmers to bring produce traditional foods for to tribal school systems and assist them in establishing new farmers’ markets.
- Assist tribes with in securing on-farm processing equipment and establishing aggregation, distribution, and processing facilities.
- Allow tribes administering FDPIR to use 5% of program funding to purchase or grow local and traditional foods for their food package.

Recommended Provisions

INSERT:

“(x) In General. – Section 4 of the Food and Nutrition Act of 2008 (7 U.S.C. 2013) is amended by inserting new subsection (b)(7):

“(A) LOCAL PURCHASE. – A tribe that is authorized to administer the distribution under subparagraph (B), shall have the option to use 5% of its program funding to promote local purchase of traditional and locally-grown food to be used in its food package by –

- (1) purchasing traditional and locally-grown foods from local Native American farmers, ranchers, and producers; or
- (2) creating and maintaining a community garden from which traditional and locally-grown foods are harvested from.”

....

4. Congress should authorize the regional procurement and distribution of traditional and locally grown food for recipients of the Food Distribution Program on Indian Reservations (FDPIR) program. The FDPIR program is a low-income food distribution program administered by the U.S. Department of Agriculture (USDA) Food and Nutrition Services. Currently, the USDA purchases and ships FDPIR foods nationwide to tribes or Indian tribal organizations for eligible recipients. This provision would authorize the USDA to purchase traditional and locally-grown food on a regional basis and to make such food available on a regional basis for FDPIR recipients. This provision promotes tribal culture, regional economic development, and encourages the use of traditional, regional and locally grown food.

Recommended Provisions

Section 4003. Food Distribution Program on Indian Reservations.

Section 4 of the Food and Nutrition Act of 2008 (7 U.S.C. 2013) is amended by inserting new subsection (b)(7) - REGIONAL PROCUREMENT AND DISTRIBUTION. The Secretary may purchase on a regional basis traditional or locally-grown food and make such food available on a regional basis for recipients of food distributed under subparagraph (b); provided, there are economic, cultural or health benefits to the tribe or Indian tribal organization harvesting the traditional or locally-grown food for recipients of food distributed under subparagraph (b); provided further, that the Secretary shall enter into cooperative agreements with tribes or Indian tribal organizations to carry out this subsection. In consultation with tribes and Indian tribal organizations, the Federal Acquisition Regulatory Council shall promulgate regulations and procedures to carry out this subsection in accordance with the Buy Indian Act, 25 U.S.C. 47, as amended, to encourage the purchase of traditional, regional and locally-grown food produced, harvested, and marketed by tribes and Indian tribal organizations, and in accordance with the Office of Federal Procurement Policy Act, 41 U.S.C. 401 et seq.

5. *Maintain current funding levels for SNAP.*

Twenty-four percent of American Indians and Alaska Natives are currently served by the SNAP program, compared to only 14 percent of the entire US population. Since most SNAP recipients are children and seniors, any cuts to the SNAP program will deeply affect American Indian and Alaska Native families.

6. *Authorize a Tribal Preference in Food Procurement. Congress should authorize USDA to include a tribal preference in their food procurement authorities. Tribal food and agriculture businesses could continue to scale up to meet this new opportunity or partner inter-tribally or community-wide to play a bigger role in food procurement and distribution for their communities. Increases in this market will provide greater job opportunities and expanded economies in tribal communities.*²⁴

Food Distribution Program on Indian Reservations

Since 2015, several tribal elected officials have engaged in ongoing tribal consultation with USDA FNS over a significant number of improvements needed to the FDPIR program. These officials have made some headway, but significant legislative changes still need to occur within the FDPIR program. Proposed changes include:

- The matching funds requirement of each of the FDPIR program sites should be eliminated, no FDPIR program site should be required to provide matching funds to participate. If funds are required, there should be no more than 5 percent matching funds required of any program site.
- The carryover prohibitions that apply to tribal feeding sites is inequitable. State feeding programs can engage in carryover of unspent funds from year to year. This unequal treatment is problematic to tribal feeding programs whose funding needs, particularly for food distribution infrastructure (e.g., warehouses), could be met by allowing carryover funding.
- No FDPIR program site should be allowed to engage in the regulatory-approved practice of

“tailgating.” It is a demeaning practice to program participants. USDA FNS should engage in tribal consultation concerning reasonable alternatives to this practice and should amend its regulations as soon as a reasonable alternative to delivery is identified.

- A contingency plan should be the subject of tribal consultation and should be reduced to writing so that all tribal program sites are aware of what will happen should any lapses in funding, disasters, government closures, or related incidents cause the stoppage of delivery of food to program sites.
- The USDA FNS should be required to hire at least one national tribal liaison located in its Washington, D.C., offices and one regional tribal liaison located in each regional FNS office. These individuals should be Native or have high levels of experience with tribal communities.
- A significant increase in nutrition education funding — at least \$5 million per year — should occur. An alternative to competitive funding should be sought so that each tribal program receives support for nutrition education program materials and a coordinated approach to nutrition education occurs.
- All FDPIR traditional food purchases (bison, wild rice, salmon, blue corn, and other products) shall be a regular part of the food package purchases and not require supplemental or special appropriations.
- A budget for warehouse and other infrastructure needs for FDPIR program sites shall be compiled after tribal consultation and shall be included in its entirety in each federal budget cycle and request until fully funded.
- All FDPIR purchasing and distribution shall occur on a regional basis and shall include as much locally and regionally tribal-produced food as reasonably possible.
- USDA must remove the “Urban Place” definition and limitation to a population of 10,000 people for FDPIR to allow tribes and the USDA to work collaboratively to serve even more tribal citizens who need nutritious food, regardless of where they live.

TITLE V: CREDIT

Due to the capital-intensive nature of farming and ranching, the Credit Title has long been an important part of the Farm Bill. Farming and ranching is a high-risk enterprise. Exposure to weather, climate and disaster events is always a possibility; and markets for food products and agriculture commodities can be impacted by local, national, and global events and seemingly unrelated policy decisions. Investments in agriculture production must always follow a “long-term” investment scenario. Good times for agriculture can very quickly be followed by bad times. Having access to a lender or an entity willing to understand these financial realities is critical. Over many decades, the federal government has maintained a continuing presence in agricultural lending. However, that hasn’t always gone so well. In the 1980s, a period known as “the farm financial crisis” significantly rattled credit markets and fundamentally changed the USDA lending portfolio. The federal government’s lending practices have been tested in the courts, and Indian Country hasn’t been immune from these situations. Prior to the 1990s and for many decades, USDA offered critical lending through an agency known as the Farmers Home Administration (FmHA). However, after the turbulent 1980s, Congress took action to separate critical functions of FmHA: farm lending was retained in the Farm Service Agency (FSA) and rural home and business lending was held within the Rural Development Agency of USDA.

Many observers believe that due to the inherently risky nature and cyclical business cycles of farming and ranching that the government must always have a presence in the agricultural lending arena. The government’s presence in agricultural lending is normally evident through either the Farm Service Agency (FSA) of USDA or the Farm Credit System. Obviously private

banks and other lending entities can also provide much-needed credit to farmers and ranchers.²⁵

The Farm Credit System (FCS) was created by Congress in 1916 and celebrated its 100th year in the business of agricultural lending in 2016. The FCS and FSA are critical lending partners to many tribes and tribal producers throughout the country. However, they are not the entire picture. Many smaller producers who are not yet ready for FSA or FCS lending relationships utilize the services of smaller retail banking entities at the local level, community development financial institutions (or CDFIs), credit unions, or other means of acquiring needed capital.

.. ——— x ^ x ——— ..

Many observers believe that due to the inherently risky nature and cyclical business cycles of farming and ranching that the government must always have a presence in the agricultural lending arena.

FSA offers direct loans to farmers, ranchers, and tribal governments and guarantees loans with preferred lenders and FCS institutions. While in the past the loan portfolio of the federal government (FSA) was approaching 80 percent direct loans and 20 percent guaranteed loans, that distribution has shifted

over time so that the lending portfolio of the federal government is now predominately offering guaranteed loans — 80 percent guaranteed loans and 20 percent direct loans. Loan programs at FSA are funded through annual appropriations at set lending limit levels, and loan servicing occurs through the federal government agency itself.

The *Keepseagle v. Vilsack* case, a lawsuit about civil rights discrimination in lending and loan servicing lawsuit brought by a group of Native plaintiffs that was later certified as a national class action, lingered in the federal court system since the 1990s. The case was finally settled in 2010 and a claims review process was undertaken. At this writing, the case is still in the courts, but hopefully in the final stages of ruling on all appeals and approving the modified settlement agreement. Regardless of the outcome of that appeals process, the USDA Farm Service

Agency has continued to extend or try to extend credit in Indian Country to support the growth and stability of Native-owned farms and ranches.

The 2014 Farm Bill continued the lending functions for agricultural operations with FSA and implemented improvements in the Down Payment Loan Program which provides capital to new farmers seeking to purchase property by increasing the total value of farmland to be purchased from \$500,000 to \$667,000.

A previously created tribal-specific lending program – the **Highly Fractionated Indian Land Loan Program** – was reauthorized in Section 5402 of the 2014 Farm Bill and amended to enable it to run more effectively. Congress allowed the authorized funds under that program to be delivered in loans through an approved intermediary relending organization and authorized the Secretary to make direct loans. The program expands eligibility of the program to individuals. These new provisions were sought after FSA conducted tribal consultation in efforts to find ways to improve the ability of the program to reach its original purposes. The 2008 Farm Bill authorized this program at \$10 million annually, but those funds were never utilized due to the structure of the program. The 2014 Farm Bill sought and achieved changes to the program delivery which have since gone into effect with the passage of new regulations and the selection of the first annual relending entity. The intent of the program is to be a useful tool to consolidate lands for agricultural purposes within Indian Country.

The 2014 Farm Bill authorized a **Microloan Program**, under which a single borrower may borrow up to \$50,000. In addition, the provision authorizes a cooperative lending pilot project for

the Secretary to identify community development financial institutions to make microloans and provide business, financial, or credit management services to microloan borrowers.

Youth Loans were also the subject of 2014 Farm Bill provisions. While USDA has long had authority to provide youth loans to encourage young people to enter farming, ranching, and agricultural pursuits, the program was plagued with problems related specifically to the burden on young people when situations outside their control (e.g., family dissolution, divorce, death of a parent or mentor) caused them to fall behind in their repayment or default on the loan altogether. The Credit Title in the 2014 Farm Bill contained a youth loan provision addressing the problem, allowing the Secretary to forgive the debt.

In addition, and regardless of the reason for the default, the provision stated that the youth borrower shall not become ineligible for federal education loans due to the default. This amendment is very important to all youth loan borrowers, and was an issue that was raised by the Intertribal Agriculture Council (IAC). This important amendment made sure that young farmers

and ranchers are not adversely impacted by a crop failure or some other reason, such as family problems, that could then follow them throughout adulthood. The Office of Tribal Relations worked closely with FSA and IAC to investigate the issues involved with youth loan defaults and the language that is incorporated into the 2014 Farm Bill will help alleviate the problems IAC raised. Prior to these changes, young people who defaulted on these small loans were put in jeopardy of receiving future student loans for college or other loans for farming and ranching, simply because of the Debt Collection Act that applies to all federal departments.

.. ————— x Λ x ————— ..

The Office of Tribal Relations worked closely with FSA and IAC to investigate the issues involved with youth loan defaults and the language that is incorporated into the 2014 Farm Bill will help alleviate the problems IAC raised.

The 2014 Farm Bill continued to prioritize loans to beginning and socially disadvantaged farmers through programs like the FSA Direct and Guaranteed Farm Ownership and Operating loan programs. USDA was given increased flexibility in determining what types of experiences should count towards the “farm management experience” requirement for direct farm ownership loans. Another change allowed lower interest rate for the Joint Financing (or Participation) loans that bring together farmers, USDA, and a private lender to leverage federal credit-focused appropriations with private lending resources.

FSA also put in place a Farm Loan Program guidance addressing many of the challenges of extending farm lending into Indian Country. This Farm Loan Program guidance (FLP-665) is entitled: “*Using Existing Regulatory Flexibilities to Lend in Credit Deserts and Areas with Unique Circumstances.*” Credit worthiness will still be required, but the potential borrower can work more closely with farm loan officers to address unique circumstances in their areas. Finally, the 2014 Farm Bill extended the life of the State Agricultural Loan Mediation Programs, which were put in place at the state level during the 1980s farm financial crisis.

In addition to other key provisions in the 2014 Farm Bill, in Section 5403, authorization was granted to cease the requirement of obtaining both a USDA appraisal and a Bureau of Indian Affairs appraisal concerning the same property when satisfying lending requirements with FSA. Prior to this change in requirements, tribal borrowers (tribes, individual tribal members or tribal corporations) experienced repetitive appraisal requirements. This provision allowed the FSA to take “notice” of an appraisal secured under an appraisal standard recognized by USDA or the Secretary of the Interior. This provision, if fully implemented, would allow tribal borrowers to save

significant money and time caused by the appraisal process when securing a loan from FSA. Finally, while few provisions in the Credit Title affect the Farm Credit System, there has been no specific statutory acknowledgement of the rights of tribal governments or groups of tribal producers to be recognized as “cooperatives” under enabling laws relating to the authority of FCS institutions to extend credit. Due to the nature of landholding and land ownership in Indian Country, some clarification of this requirement is in order but has not yet occurred.

WHY SHOULD INDIAN COUNTRY CARE?

After a period of very high farm income, there has been a downturn in recent years in farm income, and experts believe that many farm borrowers will default on farm loans in the coming months. If that occurs, the situations in the credit markets that led to the 1980s farm financial crisis and the chaos in agriculture and rural communities that ensued thereafter may be revisited. During that turbulent time, Indian Country was hit as hard or harder than most other areas of the country because of the remote and isolated nature of our farms and

the reality that in most reservation communities a “credit desert” exists alongside food deserts. Close attention must be paid to these situations as they unfold because there are many provisions of the Credit Title that still need to improve for tribal producers, and there are unique situations that apply to tribal producers that should be taken into consideration. The improvements that FSA has made in the extension of credit to farmers and ranchers in Indian

Country in the post-*Keepseagle* era continue and need to continue. Separate programs that allow for unique training and technical assistance concerning financial education and loan servicing for tribal producers must be included in future Farm Bills in

.. ———— x Λ x ———— ..
The improvements that FSA has made in the extension of credit to farmers and ranchers in Indian Country in the post-Keepseagle era continue and need to continue.

order that the ground gained in recent years is built upon and continually improved.

The lingering administrative issues that exist when tribal producers seek loans or loan servicing and must deal with both the BIA and USDA continue to exist. Without significant attention to creating efficiencies and solving problems, the delays in approvals and the related failure to extend deserved credit to producers will continue. USDA and BIA should be required to create an administrative team to review and update all practices and regulations that hinder tribal food production, tribal food system lending, and tribal loan servicing that support and maintain food production systems upon which tribal communities rely.

EXAMPLES OF OPPORTUNITIES IN THE CREDIT TITLE

The IAC recommends the following foundational changes that should occur in the Credit Title:

- **Structuring loans to suit the business:** Several innovative loan structuring measures could be authorized in the coming Farm Bill. Currently FSA will lend 100% the cost of bred livestock. They will then subordinate their lien position to a local commercial lender for annual production costs. Increasing the amount of debt secured by the same amount of assets, sometimes by as much as 25%. If the first year of operating expenses could be included in the original loan, and amortized over the life of the secured asset; producers would end the year with cash in the bank; allowing them to take advantage of pricing opportunities on input materials, replacement stock, or expansion opportunities. Such an approach would incentivize, and build a habit of, and operating from available resources, instead of what could be borrowed on an annual basis.
- **FSA planning prices:** Occasionally commodity price cycles run contrary to the mandated FSA Planning Prices which are set on a state by state

basis. Despite a producer's inclination to plan conservatively, they are often faced with choice of accepting a plan based on those planning prices, or shutting down their operation. In cases where FSA Planning Prices were more than 20% higher than the actual prices, the producer shall receive debt restructuring that will not count towards lifetime limits on loan servicing.

- **Socially disadvantaged interest rate:** An outdated statute maintains the SDR interest rate for FSA loans at 5%. This rate was set years ago when the prevailing interest rate was in the double digits. Rather than set at a static number, it should be indexed to the prevailing rate and set at a commensurate proportion of that rate. 50% of the standard rate.
- **Make food loans at FSA:** Under current program guidelines, there is some latitude for producers whose production will take a period to fully ramp up. Initial payments can be made at the 18-month mark rather than within the first year. This same methodology should be employed for producers wishing to take their raw product to the next step in the value chain.
- **Keepsaigle class forgiveness:** It is evident that during the timeframe relevant to the lawsuit, there was a systemic and deep-rooted discrimination against Native American and other producers. Many Native Americans could avail themselves of the opportunity for debt settlement and a small monetary award to attempt to make them whole. Success in this case also included a "clean slate" when dealing with the FSA in the future. Only 3,000 of an anticipated 12,000 were successful claimants, and only 5,000 applied. Many Native American producers still feeling the disenfranchisement of decades of disparate treatment, didn't take part in the process; and consequently, debt settlement they may have received during very challenging times, and in an often hostile environment **up to 30 years ago** they are forbidden from another chance at capitalizing on the improved services of the FSA. This would be a no-cost change that would improve the opportunity for many.

NCAI, in a 2013 document recommending changes in the Farm Bill, advanced the following Credit Title changes. Any changes made by language in the 2014 Farm Bill are noted:

The Credit Title authorizes new conservation loan program, expands and enhances programs and preferences for beginning and socially disadvantaged farmers and ranchers, increases loan limits for all borrowers, and makes equine farmers eligible for emergency loans. The Title also refines and clarifies rules governing financial obligations among members of Farm Credit System. Rural utility loans become qualifying loans under Federal Agricultural Mortgage Corporation (Farmer Mac) rules.

Tribal perspective is described in each section below:

1. Fractionated Land

Because of the General Allotment Act of 1887 (also called the Dawes Act), reservation land was divided up and allotted to individual tribal members. When an allottee died, ownership of the allotted parcel was divided up among all the heirs, with each Indian heir receiving an undivided interest in the parcel. With the passing of each generation, the number of owners of such a parcel of land has grown exponentially, resulting in hundreds of owners of each parcel. The resulting highly fractionated ownership of much Indian land today reduces the usefulness and value of the land and increases administrative costs to the U.S. government and the tribes. Amendments to current programs could reduce the waste and expense burden on the individual owners, the tribes and the federal government by encouraging individual Indians to purchase and consolidate highly fractionated lands, funding local financing intermediaries and ending duplicative appraisal requirements.

Recommended Provisions

A. Amend and expand the Indian Land Acquisition Program to provide loans for individual Indians to purchase highly fractionated lands. The existing program is open only to the Indian tribes and tribal corporations established pursuant to the Indian Reorganization Act. Expanding the program to

individuals would expand credit availability to qualified producers and reduce federal government expense in administering highly fractionated land.

B. Amend the Loans to Purchasers of Highly Fractionated Land Program.

The 2008 Farm Bill created a program located within the USDA Farm Service Agency (FSA) that was to authorize FSA to make and insure loans to Indian Tribes to facilitate the acquisition of lands or interests within the Tribe's reservation, or within a community in Alaska, to encourage the consolidation of fractionated lands. The language as originally passed required FSA to obtain approval of the Bureau of Indian Affairs' Indian Land Consolidation Program for post-probate applications to purchase fractionated land interests. The need for this program has not diminished, however the program in its original legislative language was unworkable, particularly in the period before Cobell settlement approval. After consultation with Tribal leadership throughout the US, the resounding recommendation was that the program should be amended by Congress to delete the requirement of BIA approval and further to allow the deployment of the program as a revolving loan fund through such organizations as the Indian Land Tenure Foundation which already has a program allowing purchases. By amending the existing language, the program would allow greater flexibility to purchase small interests and avoid lengthy probate processes.

[NOTE: After this publication, the language was approved in the final version of the 2014 Farm Bill and producers now do not have to be burdened with two appraisals on the same property.]

Existing Language (with proposed amendments):

25 U.S.C.A. § 488. Loans to purchasers of highly fractionated land

(a) In general. The Secretary of Agriculture is authorized to make loans from the Farmers Home Administration Direct Loan Account created by section 1988(c) of Title 7, and to make and insure loans as provided in sections 1928 and 1929 of Title 7, to any Indian tribe recognized by the Secretary of the Interior or tribal corporation established pursuant to

the Indian Reorganization Act (25 U.S.C. 477), which does not have adequate uncommitted funds, to acquire lands or interests therein within the tribe's reservation as determined by the Secretary of the Interior, or within a community in Alaska incorporated by the Secretary pursuant to the Indian Reorganization Act [25 U.S.C.A. § 461 et seq.], for use of the tribe or the corporation or the members of either. Such loans shall be limited to such Indian tribes or tribal corporations as have reasonable prospects of success in their proposed operations and as are unable to obtain sufficient credit elsewhere at reasonable rates and terms to finance the purposes authorized in sections 488 to 494 of this title.

(b) Highly fractionated land

(1) In general. Subject to paragraph (2), the Secretary of Agriculture may make and insure loans in accordance with section 1929 of Title 7 to eligible purchasers of highly fractionated land or to intermediaries to establish revolving loan funds for the purchase of fractionated land pursuant to section 2204(c) of this title. (Highlighted language should be removed and the italicized language should be inserted.)

(2) Exclusion

Section 491 of this title shall not apply to trust land, restricted tribal land, or tribal corporation land that is mortgaged in accordance with paragraph (1).

2. Remove the Graduation Requirement for FSA programs.

Due to the general lack of credit availability on Indian reservations, it is difficult to access tenable credit rates for even experienced producers operating farms and ranches on trust lands. Removal of the statutory requirement for graduation from FSA programs for producers on Indian Reservations would allow agriculture operations to be more stable. The deletion of a graduation requirement would assist other producers as well who farm and ranch in areas where credit access is tenuous at best.

3. Remove the Requirement for Private Credit Denial.

Clearly state that three (3) denial letters from private credit sources is not a requirement for Tribal members to participate in an FSA loan program. Currently

the practice is to require three (3) denial letters from private credit sources to be considered for FSA loan programs. On Indian reservations, there is a general lack of private lending at all, which renders the requirement onerous and unduly burdensome. By removing the private credit denial provision other producers who reside in locations where private lending is inaccessible would also be assisted.

4. Amend requirements concerning Rural Youth Loan Debt Collection.

Many Native or rural youth access "youth loans" through FSA to assist them in participation, at a very young age, in such programs as FFA, 4-H or other youth agriculture leadership development programs. Accessing lending to begin building a livestock herd at a very early age can help overcome the challenges of entry into a very capital intensive commercial activity. These loans have high success rates both among Native and non-Native youth. However, if the loan moves into a troubled loan status, these loans are subject to federal Debt Collection Act and as such can seriously impact a young person's ability to access loans for college, a vehicle, or their first job. These loans are generally less than \$5,000 and are used to provide youth the opportunity to gain experience through FFA, 4-H or other beginning farmer experiences. If a youth loan goes into default, the borrower is referred to Treasury for further action, thus making the young person subject to debt collection and negative impact when applying for government-backed student loans, or other federal programs or services when they become an adult. In some situations, the parents are primarily responsible for the loss but the collection activity affects only the youth. Decoupling youth loans from certain federal collection requirements would avoid causing long term harm to student borrowers. This provision would assist native youth as well as all rural youth seeking experience in farming and ranching through the youth lending program. (NOTE: This provision was included in the 2014 Farm Bill in its final version).

5. Changes to Definitions of Land Owned by Indian Tribes

There is no common definition of "land owned by

Indian Tribes” across all USDA programs. As such, inconsistent program access even within programs run by a single agency can occur. An alternative to placing the definition in a section having application broadly across the entire Department, is to place it within the Definitions section of the Conservation Title, where the most common problems associated with lack of common definition are most pronounced (WRP, VPA, CRP, etc.).

A. Add language in a Definition section applying to all USDA administered programs across all relevant titles (as opposed to each individual title/program):

“Land owned by Indian Tribes or Tribal Members” shall mean:

- (1) Land held in trust by the United States for individual Indians or Indian Tribes; or
- (2) Land, the title to which is held by individual Indians or Indian Tribes subject to Federal restrictions against alienation or encumbrance; or

- (3) Land which is subject to rights of use, occupancy, and benefit of certain Indian Tribes; or
- (4) Land held in fee title by an Indian, Indian family, or Indian Tribe; or
- (5) Land owned by a native corporation formed under 25 U.S.C. Section 477, 43 U.S.C. Section 1606 or 43 U.S.C. Section 1607; or
- (6) A combination of one or more of the lands listed above.

6. GAO Study

The Intertribal Agriculture Council, based on its finding of the existence of “Credit Deserts” in Indian Country, asserts the need for an in-depth analysis by the Government Accountability Office into the nature of credit in Indian Country; specifically examining compliance with the Community Reinvestment Act by banks on and near Indian Reservations.²⁶

TITLE VI: RURAL DEVELOPMENT

The Rural Development Title creates programs that support: rural business and community programs; housing; rural infrastructure, including electric and telecommunications services; rural water and sewer infrastructure; and rural hospitals and healthcare, among many other programs. As the only agency within federal government that focuses solely on the needs of rural America, the provisions within the title are extremely important to rural citizens, including those who live within Indian Country.

Many of the programs in the Rural Development Title are based on loan authorities, and some are delivered through grant programs. The USDA services the loan portfolio, and the infrastructure programs specifically are facilitated by a team of technical service providers who help communities and potential borrowers analyze infrastructure needs, develop engineering specifications, and analyze financial feasibility of projects. The needs of infrastructure in rural America have likely never been greater except during the early periods of attention to the needs of rural people and places. Electricity programs contained within the Rural Development Title were preceded by early laws such as the Rural Electrification Act of 1936 which addressed the profound needs of rural communities that were not being serviced because commercial providers had no economic incentive to serve smaller population groups. Rural cooperatives (electric and telephone) were created under laws dating back to the 1940s, and they have been relatively successful in bringing most services to rural areas by funding such activity and making investments where investments might not otherwise happen. However, Indian Country for the most part has not been the beneficiary of such programs. Without critical infrastructure — water, sewer, electrical, telephone, broadband, energy, etc. — rural America and Indian Country will be left further behind than they already are and will be unable to build or sustain thriving economies and businesses. Critical infrastructure in these locations is already in crisis mode, but in many locations throughout Indian Country, that infrastructure was never built in the first place.

The Rural Development Title contains many provisions that are vitally important to tribal governments, communities, and businesses. Among these programs are: Rural Water and Waste Disposal Loan and Grant; Emergency and Imminent Community Water Assistance; Water and Waste Facility Loans and Grants; Water Systems Grants for Rural and Native Villages in Alaska and Hawaii; Solid Waste Management Grants; Rural Water and Waste Water Circuit Rider Program; Household Water Well Systems Program; Community Facilities Loan and Grants; Rural Business Development Grants; Value-Added Producer Grants; Agriculture Innovation Center Demonstrations; Rural Cooperative Development Grants; Intermediary Relending; Rural Microentrepreneur Assistance; Rural Business Investment; and Rural Housing.

The 2014 Farm Bill extended most rural development programs but generally reduced funding authorization levels for some programs while increasing funded for others, and provided limited mandatory funds. Rural electrification and telephone loan programs were extended with minor changes and several programs in rural business development, energy, and broadband were amended, introduced or replaced. There was a new focus on regionally focused economic development strategies and some programs experienced eligibility changes, including amendments to the definition of “rural” in some programs.

The **Value-Added Agricultural Product Market Development Grants Program** was extended with increased mandatory funding from \$15 million to \$63 million per fiscal year. Veteran farmers and ranchers were specifically made eligible for a priority in funding and the Secretary is required to give priority to projects that contribute to creating or increasing marketing opportunities for certain types of operators, farmers, and ranchers.

Rural broadband telecommunication services programs were extended with new eligibility requirements for loans, follow-up on loans granted, data collection metrics, and studies of loan

program effectiveness. Broadband is redefined as transmission capacities of 4-Mbps downstream and 1-Mbps upstream. The new Rural Gigabit Network Pilot Program aims to bring ultra-high-speed Internet service to rural areas.

Integration of **information technologies** funding was authorized for integrating Internet processes into business practices. The Rural Business Development Grants program may be used directly for establishing centers to provide training to rural businesses in interactive technology and to support projects for development of enterprises that facilitate the operation of rural distance learning networks and rural learning programs.

The **Rural Energy Savings Program** was created to help families and small businesses in rural areas achieve cost-effective energy efficiency with annual funding authorized at \$75 million.

The **Rural Business Development Grants Program** was authorized at \$65 million annually and replaces the Rural Business Enterprise Grant Program and Rural Business Opportunity Grant Program. **The Rural Microentrepreneur Assistance Program** was extended with mandatory funding of \$3 million.

The Secretaries of Agriculture and Transportation were mandated to complete an updated study on **rural transportation** issues (freight transportation of agricultural products, renewable fuels, and other issues of importance to rural community economies) within one year. Eligibility for **Rural Housing Service** programs authorized under the 1949 Housing Act was modified so that eligibility is consistent through the 2020 Census. User fees for baseload generation in the Rural Development Electric program allow the program to finance new baseload generation.

The 2014 Farm Bill also reduces authorized funding for many programs, including: Rural Water Circuit Rider Program (reduced from \$25 million to \$20 million annually); Solid Waste Management Grant

program (limited to \$10 million annually from a previous unlimited level); Household Water Well System (reduced from \$10 million to \$5 million annually); Rural Cooperative Development Grant program (\$50 million to \$40 million annually); Rural Business Investment Program (reduced from \$50 million to \$20 million annually); Distance Learning and Telemedicine Program (reduced from \$100 million to \$75 million annually); Agriculture Innovation Center Demonstration Program (reduced from \$6 million to \$1 million annually).

A new **Rural Gigabit Network Pilot Program** provides \$10 million annually for ultra-high-speed Internet service in rural areas which will elicit new data on the need for, and the economic effect of, ultra-high-speed Internet technologies in rural settings. The Rural Utilities Service Broadband Loan program continues, with improved reporting and data collection requirements.

In addition to the sections discussed above, the 2014 Farm Bill included reauthorization of the **Tribal College and University Essential Community Facilities Program** through 2018. This provision is found in Section 6005 and includes tribes in the essential community facilities technical assistance and training program.

The **Water and Wastewater** programs have been extended and \$150 million in mandatory funding for the programs was authorized. Emergency water assistance programs, rural water well programs, solid waste management grants program, and the Alaska Native village rural water programs were all extended.

Rural Business and Industry Loan Program and **Rural Business Development Grants Program** were extended and tribes were specifically identified as eligible. These programs include grant funds for planning, technical assistance and feasibility studies for rural business development projects. Rural cooperative development grants were extended, along with local and regional development food projects were extended. Rural

economic development partnerships program, rural microenterprise development programs, and the intermediary relending program were extended and tribes were included.

Electrification and broadband telecommunications programs were extended and new language was included concerning national rural broadband mapping and attention to the needs of those not covered by broadband. In addition, distance learning and telemedicine programs were extended and a rural gigabit network pilot program was created.

The **Value-Added Agriculture Product Development Program** was amended and extended; ag innovation center programs were extended; regional economic development infrastructure programs were included; and strategic economic and community development programs were included. An administrative notice that released between the 2008 and the 2014 Farm bills clarified that tribal food enterprises of all types were entitled to full participation in the program. The USDA Rural Development (RD) offices had labored for many years under false assumptions about ownership of agricultural products and common ownership patterns, and the administrative notice clarified and provided key examples that offered clarity to RD field offices that began to see more Indian Country value-added projects being funded. In the Value-Added Producer Grant Program, the bill provided \$63 million over five years to assist farmers with the development of high-quality farm-based products differentiated by production processes, physical segregation, or marketing.

The bill also adds veteran farmers and ranchers to the priority eligibility category for the Value-Added Producer Grant Program and makes very important changes to the determination of which projects from groups of producers receive priority consideration. Priority will be given to those projects that “best contribute” to creating or increasing marketing opportunities for small and mid-sized family farms and beginning, socially disadvantaged, and veteran farmers or ranchers.

Rural Business Opportunity Grant and Rural Business Enterprise Grant programs were merged into one program, known as **Rural Business Development Grants**, with authorization for up to \$65 million in discretionary funding per year over five years, but no mandatory funding. The bill limits the use of funds for certain activities previously funded by Rural Business Opportunity Grants, allowing up to 10 percent of total appropriated dollars to be used for planning projects, technical assistance and training to existing or prospective entrepreneurs and managers, localized economic development planning, and certain business training centers.

WHY SHOULD INDIAN COUNTRY CARE?

The 2008 Farm Bill included a provision called the Substantially Underserved Trust Area (SUTA). This provision applied to some, but not all, RD programs and authorities (mainly to basic infrastructure such as water) and allowed those who could demonstrate that they existed in a “substantially underserved trust area” to gain access to important waivers of program requirements, lower interest rates, longer repayment terms, and similar assistance through RD programs. In addition to clearly applying to many areas of Indian Country, the SUTA provision also proved helpful to territories of the U.S. During the 2008 implementation period and the months approaching the negotiation of the next Farm Bill, USDA officials discussed publicly their willingness to apply SUTA throughout the RD programs and authorities. This important provision should resurface in future Farm Bill negotiations. It will go a long way to ensuring more equitable access to RD programs and authorities, and can be used to provide important support to tribal citizens living in remote, rural, isolated communities who are in dire need of the impact of RD programs.

By the end of FY 2016 (September 30, 2016) USDA RD had 28 tribal projects on hand that were not funded. Of those, 15 were complete applications that could have been funded if the agency had access

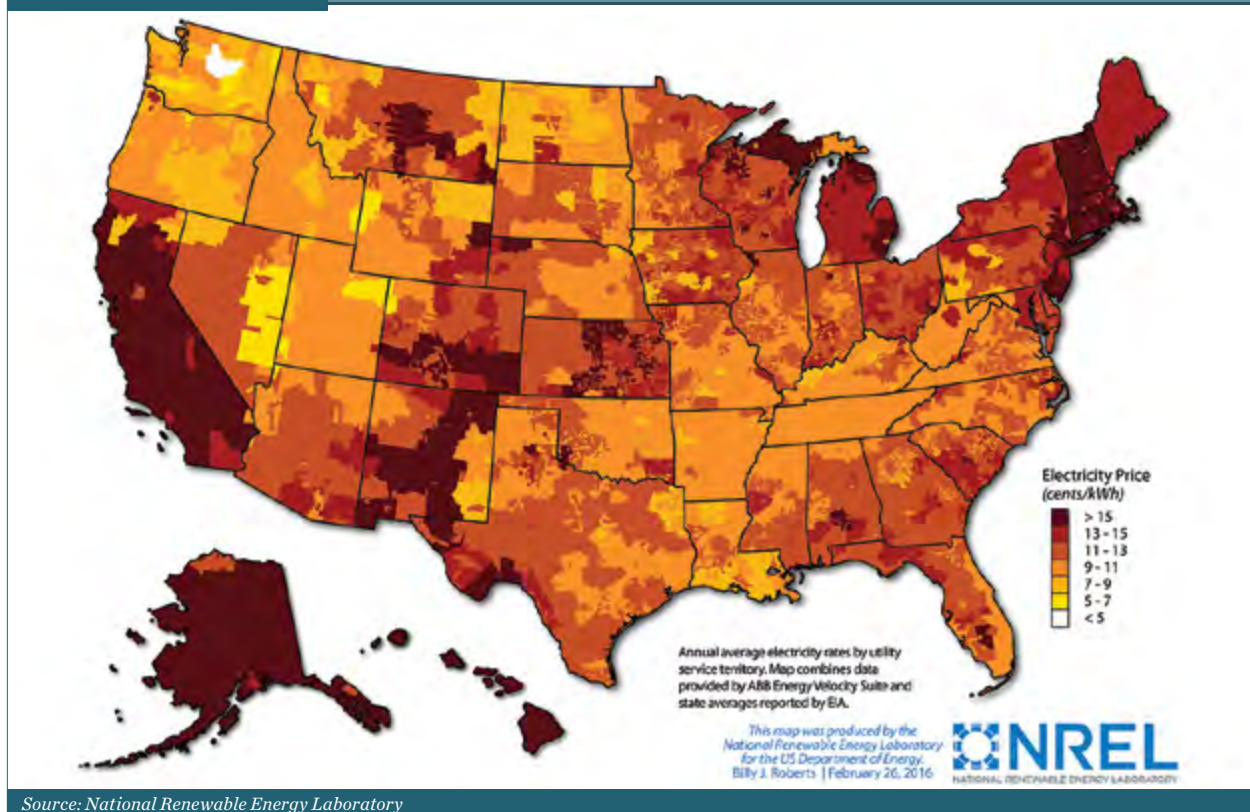

to more funding. The 15 complete applications requested \$18 million (\$16.8 million in grant funding and \$1.2 million in direct loan financing). The 13 incomplete applications requested \$37.1 million (\$18.8 in grant funding and \$18.3 in direct loan financing). The Indian Health Service also reports a gap between available funds and need in Indian Country and Alaska.

As to RD electric programs, in FY 2016 there were loan funds remaining at the end of the year. Almost all funding in the RD electric programs are used by electric utilities. In FY 2016, USDA RD provided Electric Loans to Tohono O’odham Utility Authority and Yakama Power. In that same program area, RD has the High Energy Cost Grants Program that provides grants to help lower the cost of electricity in areas where energy costs are 275 percent of the national average or higher. Most of the communities that receive assistance in the program are off the grid, very remote, and have high variability in temperatures. Consequently, much of the program is focused on Alaska and the Navajo Nation. In that program’s FY 2016 competition, RD

received more than \$48 million in eligible requests with substantial representation from tribal entities and Native Alaskan corporations, yet only \$16.9 million was available. So, the high levels of need in Indian Country go unmet.

The Indian Health Board, in testimony offered to Congress in March 2017,²⁷ cited significant needs in the realm of hospital infrastructure, sanitation needs in communities, housing for medical professionals, and other key deficiencies in funding. The agencies of RD will often partner with other agencies of the federal government, such as Environmental Protection Agency, Indian Health Service (IHS), or others, to provide funding for much needed projects. The project needs in Indian Country include: 6 percent of all tribal houses are in need of adequate sanitation facilities and approximately 47 percent of all American Indian/Alaska Native homes are in need of some form of sanitation facility improvements. Indian Health Service estimates in 2017 that the backlog for sanitation facilities is approximately \$2.5 billion, according to its Sanitation Deficiency System.

ELECTRIC RATES: Residential, 2013

Source: National Renewable Energy Laboratory

Housing for medical professionals needed to staff reservation, rural and remote medical facilities that Indian Health Service is obligated to provide for Native people reflects (as of 2017) 1,550 vacant positions within medical staff due solely to lack of housing. Large numbers of IHS facilities do not currently have sufficient bandwidth to offer telehealth and related services. Approximately 50 percent of the IHS sites still depend on circuit connections based on one or two T1 lines (3Mbits). IHS estimates that a fully operational enterprise telehealth program could be supported at a cost of \$75 million annually. The IHS further estimates that it could cost up to \$3.5 billion, over two to three years to transition the agency from Resource and Patient Management System to a full commercial suite of comparable capability. (The entire annual budget of the IHS is under \$5 billion). Estimates indicate adding supplemental appropriations of \$3.5 billion to purchase or develop a much-needed new Health Information Technology system for the existing system. Significant needs also exist in biomedical equipment for facilities within the Indian Health Service system and for health information systems.

EXAMPLES OF OPPORTUNITIES IN THE RURAL DEVELOPMENT TITLE

First, IAC is correct. The implementation of the SUTA provisions throughout all RD programs and authorities is much needed to improve the economies of tribes in rural areas. **In addition, IAC offers the following foundational recommendations for Rural Development Title needs:**

Uplift America: *The concept of getting all loan guarantee authority batched up and obligated annually is a game changer. The requirements put upon CDFIs to participate in this endeavor are patently prohibitive. Only the largest CDFIs could secure any meaningful funding levels, and some had threatened litigation to do that. A process must be developed to allow small, new, and emerging CDFIs access to this valuable tool.*

Rural Electric Loan and Grant Program: *Rural electric cooperatives are uniquely poised to be economic development drivers in*

their communities. Often, they choose not to avail themselves of this opportunity. In cases where a rural electric cooperative chooses not to participate in this program for a period, this opportunity should be extended to local CDFIs to carry out the function.

Substantially Underserved Trust Area (SUTA): *In addition to preserving the existence of current programming, the further broadening of the “Substantially Underserved Trust Area” (SUTA) provisions is needed. They are currently applied to a small segment of the infrastructure programs, but more explicit guidance must be provided to allow the Secretary to exercise this discretion more broadly.*

In its FY 2017 budget request to Congress, NCAI offered these fundamental recommendations for improving the Rural Development Title:

Rural Development, Rural Housing and Community Facilities Programs: *Authorize a set-aside of \$20 million from the Rural Development 502 Direct Loan Program to establish a demonstration relending program for Indian Country. Rural Development has limited staff resources to provide Single Family Housing direct loans on tribal land.*

.. ——— x ^ x ..

It will go a long way to ensuring more equitable access to RD programs and authorities, and can be used to provide important support to tribal citizens living in remote, rural, isolated communities who are in dire need of the impact of RD programs.

In FY 2014, of the 6,575 direct loans made nationally by Rural Development, only seven of them were to American Indians or Alaska Natives on tribal land. Native community development financial institutions (Native CDFIs) have experience operating on tribal land. In addition, they provide extensive financial and homebuyer education to their clients. The proposed demonstration relending program would make Native CDFIs eligible borrowers under the 502 direct loan program and enable them to relend to eligible families for the construction, acquisition, and rehabilitation of affordable housing.

Rural Development, Rural Utilities Programs, and Rural Housing and Community Facilities Programs: Provide a minimum of \$2.5 billion to USDA Rural Development. *As tribes seek to build sustained prosperity and economic security, it is imperative that tribal citizens and businesses on tribal lands have access to environments that are stable, conducive to economic and community development and supportive of schools, health facilities, first responders and businesses.*

The Department of Agriculture's Rural Development (USDA-RD) programs support a broad array of utility needs and business activities in Indian Country by providing loans, grants, and other assistance for community facilities, housing financing, preservation and repair, electric utilities, high-cost energy, telecom infrastructure and distance learning, broadband infrastructure, water/waste systems and other infrastructure deployment. USDA-RD manages programs across three mission areas – the Rural Business and Cooperative Programs (see Economic Development section above), Rural Housing and Community Facilities Programs, and Rural Utilities Programs. Through its Rural Development mission area, USDA administers and manages housing, business, and community infrastructure and facility programs through a national network of state and local offices. These programs are designed to improve the economic stability of rural communities, businesses, residents, farmers, and ranchers and improve the quality of life in rural America.

Provide \$9 billion to Rural Utility Services: *The FY 2016 budget for Rural Utility Services saw a slight increase, but continues to be below FY 2012 and 2013 levels nearly \$2 billion dollars, and is down almost \$100 million from FY 2014. USDA-RD began implementing changes in 2012 designed to improve access to RUS funding for individuals living in Substantially Underserved Trust Areas (SUTA – including Indian lands and lands owned by Alaska Native Regional Corporations and Village Corporations – to improve basic services, including: water and waste disposal, rural electrification and high-cost energy, telecommunications and broadband infrastructure, and distance learning and telemedicine. The SUTA changes, authorized by the 2008 Farm Bill (but not appropriated), still require additional funding for administration as well as for programs and loan authority within RUS. It is important that more funding is available to provide the infrastructure development and upgrades necessary in Indian Country.*

Of special concern is the need to maintain funding for tribal set-asides for water, wastewater, and solid waste management for Indian Country and Alaska Native villages. USDA's Water and Environmental Program (WEP) provides a combination of loans, grants, and loan guarantees for drinking water, sanitary sewer, solid waste, and storm drainage facilities in tribal and rural areas and cities and towns of 10,000 or less. WEP also makes grants to nonprofit organizations to provide technical assistance and training to assist rural communities with water, wastewater, and solid waste management. Since FY 2013, funding for WEP was substantially cut and only provided tribal-specific grants and loans of \$22 million for tribes in the lower 48 states and \$23 million for Alaska Native villages, equaling cuts of \$26 million and \$61 million respectively. The FY 2016 budget allocation of \$64 million remains static as it must be split amongst tribes in the contiguous United States, Alaska Native tribes, and Native Hawaiians.

More than 12 percent of tribal homes lack access to safe drinking water and basic sanitation, which is a

rate more than 20 times the national average.²⁸ For example, many Alaska Native villages must transport human waste in large containers to open pit sewage lagoons. The federal government's failure to address this situation is unacceptable, especially in light of its trust obligation to tribal nations. The existing federal budget does not make a significant dent in addressing this fundamental deficit in quality of life for Native peoples, and recent cuts to this budget makes it worse, exposing Native peoples and youth to unhealthy water and its subsequent detrimental impacts to human health, economic development, and community morale.

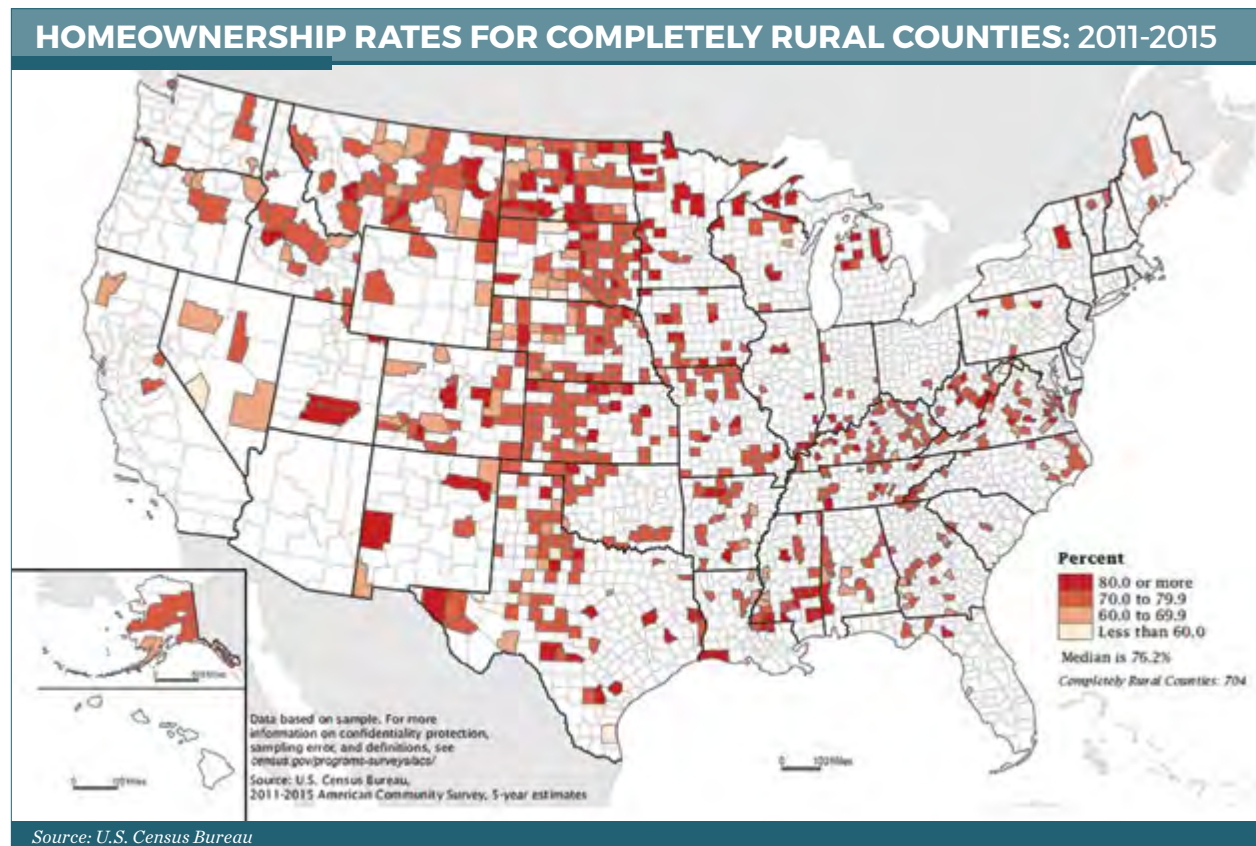

Rural Development, Rural Housing and Community Facilities Programs: Provide a minimum of \$28 billion in loan authority for the Rural Housing and Community Facilities Programs: In FY 2013, the Rural Housing Service (RHS) programs provided \$177 million in economic support to American Indian and Alaska Native enterprises and communities as well as tribal colleges. RD provided 56 Single Family Housing direct loans, equaling \$119 million, and 1,100 Single Family Housing loan guarantees at \$155 million. Tribal

colleges received \$3 million for 24 grants under the Tribal College Community Facilities Initiative, and tribal communities received more than \$114.7 million in loan and grant financing under the Community Facilities Program.

Access to housing, community and home repair financing provides Native individuals, families and communities with security, credit facilities, and repair and weatherization needs. This financing also supports community and educational facilities and provides employment in construction and related industries that flows from access to capital in Indian Country.²⁹

In 2013, NCAI issued the following comments concerning a similar set of recommendations for the Rural Development Title:

The Rural Development Title of the Farm Bill supports business and community programs for planning, feasibility assessments, and coordination activities with other local, state, and federal programs to provide rural economic development opportunities.

Programs include rural development loan and grant programs and authorize several new provisions, rural infrastructure, economic development, and broadband and telecommunications development, among other programs.

Tribal Perspective:

The most critical agency in the federal government to the long term rural economic and infrastructure needs in Indian Country is the Rural Development agencies within USDA. Rural Development has within its general and historic authorities' programs that are comprehensive to the needs of rural people and are critical to the needs of communities. Among these are: water and wastewater, broadband, electrification, housing, business development, and more. Rural Development has full lending authority and is one of two "banks" within the USDA program family. Ensuring greater access to, utilization of, and engagement with Rural Development programs is critical to the success of Indian Country. In addition, the Rural Development agencies are home to most of the USDA work in Energy, making the engagement of the Department with their sister agency the DOE, an important focus in the years to come.

Many of the tribal requests are included under general provisions that are applicable to all, with special emphasis and priorities on underserved communities. Continued funding for infrastructure such as housing, energy, broadband services, and water and waste water systems as well as community development, regional authorities, and other new programs is needed. Tribal lands continue to operate with either outdated systems or a complete absence of vital infrastructure. It is essential that targeted funding be streamlined and made available to tribes to acquire, invest in, and maintain these infrastructures.

1. Broadband

A. Extend the three-year buildout requirement to a five-year period. Tribal lands face numerous barriers to broadband deployment that occasionally make it difficult to complete projects within the three-year broadband service build out requirement, and provide complications for USDA reporting requirements. Extension of the build out requirement will allow

tribes additional time to acquire necessary rights-of-way permits through tribal and allotted lands ('checker board areas' and non-Indian fee lands within reservation boundaries), address issues with environmental impact studies, and provide additional time to address tribal specific cultural needs.

Recommended Provisions

INSERT NEW:

"(a) In General. —Section 601 of the Rural Electrification Act of 1936 (7 U.S.C. 950bb) is amended to read as follows:

"(d) Eligibility. —

"(1) Eligible Entities. —

"(A) In General. —To be eligible to obtain a loan or loan guarantee under this section, an entity shall—

"(iii) agree to complete buildout of the broadband service described in the loan application by not later than 5 years after the initial date on which proceeds from the loan made or guaranteed under this section are made available."

B. Include Community Connect Grant as eligible for SUTA Provisions

The Substantially Underserved Trust Area (SUTA) provisions promulgated by the 2008 Farm Bill (Public Law 110-234, May 22, 2008) allow tribes to participate in loan, loan guarantee, and grant programs available through the Rural Utilities Service. Eligible programs for SUTA:

- Rural Electrification Loans and Guaranteed Loans, including High Cost Energy Grants
- Water and Waste Disposal Loans, Guaranteed Loans and Grants
- Telecommunications Infrastructure Loans and Guaranteed Loans
- Distance Learning and Telemedicine Grants
- Broadband Loans and Guaranteed Loans

Due to high non-connectivity rates of broadband service in Indian Country, and to create a more level playing field for tribal participation in USDA Rural Utilities Service programs, the Community Connect Program should be added to the list of the eligible programs for SUTA. Although the program was just recently announced a budget of \$10,372,000 for Fiscal Year 2012, which is a relatively small number of funds compared to other RUS programs, tribes should be

able to utilize the SUTA provisions to obtain a priority to a certain percentage of funds.

Recommended Provisions

Amend Sect. 306F. Substantially Underserved Trust Areas (7 U.S.C. 936f), (c) Authority of the Secretary by inserting after (c)(4) the following:

“(c)(5) shall give preference to federally-recognized tribes for the all Rural Utilities Service grant programs.”

C. Allow Eligibility for Current RUS Loan Recipients to Refinance at the SUTA 2% Interest Rate One of the Substantially Underserved Trust Areas (SUTA) provisions includes an authorization for the Administrator of RUS to finance loan, grant, and combination loan and grant programs with interest rates as low as two percent and extended repayment terms. Tribes have expressed interest in having the ability to request the Administrator to refinance their existing loans under the SUTA provisions, those loans used for financing telecommunications infrastructure projects on tribal lands. Since the Federal Communications Commission (FCC) have adopted and implemented the USF/ICC Transformation Order, numerous tribal and rural RUS loan recipients have expressed concern over the loss of USF subsidies and how it could affect their RUS loan repayment. Enabling tribes, or those telecommunications providers serving SUTA eligible tribal lands, with the ability to refinance at the ‘as low as’ 2% interest rate would dispel concerns regarding loan repayment terms and telecommunications providers losing subsidies due to ICC/USF reforms being implemented at the FCC.

Recommended Provisions

Amend Sect. 306F. Substantially Underserved Trust Areas (7 U.S.C. 936f), (c) Authority of the Secretary to read as follows:

“(a)(2)(c) Authority of the Secretary

“In carrying out subsection (b), the Secretary---

(1) may make available from loan or loan guarantee programs administered by the Rural Utilities Service to qualified utilities or applicants financing with an interest rate as low as 2 percent, and with extended repayment terms;

(2) may permit refinancing of loans described in

previous paragraph (1) with an interest rate as low as 2 percent, and with extended repayment terms to previously awarded loans;

(3) may waive non-duplication restrictions, matching fund requirements, or credit support requirements from any loan or grant program administered by the Rural Utilities Service to facilitate the construction, acquisition, or improvement of infrastructure;

(4) may give the highest funding priority to designated projects in substantially underserved trust areas; and (5) shall only make loans or loan guarantees that are found to be financially feasible and that provide eligible program benefits to substantially underserved trust areas.”

D. Amend the Definition of Trust Lands to Include Tribal Fee Lands Eligible for SUTA

During the rulemaking process where the USDA was soliciting comments on the implementation of the 2008 SUTA provisions, RUS responded to tribal commenters requesting USDA to extend the SUTA provisions to, “all land (including all ‘fee land’) within tribal reservation boundaries to be qualified as trust lands for the SUTA Provision” (Federal Register/Vol. 77, No. 114/Wednesday, June 13, 2012, pg. 35247). RUS’ response for not including tribal fee lands as eligible for the SUTA provisions stated, “With regard to trust land status, the RUS does not have the authority to adjust the statutory definition of trust lands. RUS understands the unique ‘checker board’ character of trust and non-trust lands in tribal communities. The agency, consistent with its current practice, may consider SUTA related applications that include non-Trust territories when the service to or through those areas are ‘necessary and incidental’ to improving service to the Trust area.” Generally, non-trust lands or tribal fee lands are severely fractionated, which could hamper proposals and completions of SUTA eligible projects.

2. Housing

Ensure tribal governments are eligible for USDA housing programs as direct recipients of funding. Tribal access to a range of USDA housing programs would significantly impact the capacity of tribes to deliver affordable housing services. Specific programs that should include direct tribal access include: the Section 515 Rural Housing Loans; Section 502

Direct Housing Loans; Section 504 Very Low Income Home Repair Grant and Loan Program; Section 533 Housing Preservation Grants; Section 538 Guarantee Program; and USDA Rural Development's Rural Utilities Services.

Recommended Provisions

INSERT NEW provision of S.3240, Title VI Rural Development, Subtitle C Miscellaneous:

"SEC. _____. Housing and Community Development Programs and Activities – Indian Tribes and Low Income Tribal Members.

(a) In general. - The Secretary is authorized to help directly to Indian tribes, their tribally-designated housing entities, and their low-income tribal members in Indian areas for the following housing programs and activities:

- (1) rural housing loans (42 U.S.C. §1471-§1472);*
- (2) direct housing loans (42 U.S.C. §1472(h));*
- (3) very low income home repair grants and loans (42 U.S.C. §1474);*
- (4) housing repair, rehabilitation, and preservation programs (42 U.S.C. §1490); and*
- (5) multifamily housing construction, acquisition, or rehabilitation programs (42 U.S.C. §1490p-2).*

(b) Definitions. – For purposes of this Act, the following definitions shall apply:

- (1) "Indian area" – the term "Indian area" has the same meaning as that term is used in 25 U.S.C. §4103(10);*
- (2) "Indian tribe" – the term "Indian tribe" has the same meaning as that term is used in 25 U.S.C. §4103(12);*
- (3) "Tribally-designated housing entity" – the term "tribally-designated housing entity" has the same meaning as that term is defined in 25 U.S.C. §4103(21).*

(c) Allocation of Funds. For allocation to Indian tribes and tribally-designated entities, the Secretary shall set aside from amounts appropriated for those programs and services enumerated in subsection (a) above, not less than 10 percent of the amounts made available in each fiscal year.

3. Delta Regional Authority

Ensure tribal participation on all boards and authorities that work across tribal lands.

The Delta Regional Authority is the only regional authority with Tribes that lack a Tribal Co-chairperson. Include in any reauthorization language a provision creating a Tribal Co-Chairperson who is "a member of an Indian tribe, who shall be a chairperson of an Indian tribe in the region or a designee of such a chairperson, to be appointed by the President, by and with the advice and consent of the Senate." (Note: the same holds true for membership on the Appalachia Regional Commission).

4. Match Requirements

Waiver of Match Requirements be available and that waived match requirements have no adverse effect on ranking or scoring of application submitted by social disadvantaged farmers and ranchers.

5. Value-Added Producer Grant

1. Explicitly make Tribes eligible for participation in the VAPG program.

2. Authorize the Rural Development State Director to approve applications up to \$100,000.

3. Waive match requirements for socially disadvantaged farmers and ranchers.

6. Rural Energy for America Program

1. Rural Development shall set aside ten percent of authorized and appropriated funds for the Rural Energy for America program to be utilized by Tribal governments, Tribal entities and/or individual Tribal members.

2. Waive match requirements for socially disadvantaged farmers and ranchers.

7. RD Demographics

Break demographics down to School Districts rather than counties to get a more accurate picture of poverty rates and income levels.

8. Maintain all present American Indian Programs and set asides.

Apply Substantially Underserved Trust Areas to all the RD Mission Areas.³⁰

The cumulative list of NCAI recommendations in recent years, along with the recommendations of IAC, provide a key foundation for the full utilization

of RD in Indian Country. The RD family of agencies is the most critical department for building rural and reservation economies. In addition to the important specific recommendations provided above, one additional issue should be considered.

Tribal staff, businesses, companies, or individuals who might otherwise be eligible for RD programs often choose not to apply for these programs. The tribal set-asides that existed in the Rural Business Enterprise Grants and Rural Business Opportunity Grants programs were lost when the two programs were rolled into what is now the Rural Business Development Grant Program. While tribes clearly are eligible for priority points on most applications due to need, remoteness, or other conditions, tribes do not apply with as much frequency as they could. This is largely because no centralized, consistent, and in-depth technical assistance exists to help tribal staff or tribal business entities staff understand the complexities of RD application processes, how the requirements apply to their situations, and how tribal applicants can best position themselves and their ideas for competitive success.

Because of these realities, two additional recommendations are in order: (1) a tribal set-aside in either terms of percentage of the funding portfolio or a specific funding level for tribal applications within each of the RD program authorities; and (2) a permanent office providing technical assistance across all RD funding authorities must be invested in via a cooperative agreement with USDA.

The inadequacy and general lack of rural infrastructure in Indian Country clearly supports

the need for a tribal-specific set-aside in RD programs. The trust responsibility of the federal government to tribes is the broad foundation for such set-aside. Another key reason for the set-aside

is that without dedicated funding for it, the promise of these places will never be realized and Indian Country's infrastructure will continue to decline. In many areas around the country, tribal governments are the strongest remaining rural government entity and in some locations, tribal governments are taking over the management of key infrastructure (such as water systems, electric, and

other utilities) because there is no other sound governmental or non-governmental entity located there that can handle these functions.

As to the need for technical assistance, there are two rationales for establishing such an office or entity. First, the complexities of lending and infrastructure establishment in Indian Country – tied to the nature of the trust land base – call for the establishment of such an office that can prepare and monitor lessons learned, establish simpler-to-use systems for understanding application requirements, and assist staff at the tribal or business level in preparing applications. (This is a function the federal government cannot readily undertake.) Second, the trust responsibility of the federal government to tribes supports the need to establish such assistance interventions. This is not unheard of. The RD family (particularly in the infrastructure arena) has a system of field staff who assist agency staff and the applicant in analyzing financial viability, key engineering specifications, and related technical requirements.

.. ——— x Λ x ——— ..

The trust responsibility of the federal government to tribes is the broad foundation for such set-aside.

TITLE VII: RESEARCH

The Research Title is among the oldest of the Farm Bill, emanating from the Morrill Land Grant Act of 1862. The original purpose of the Morrill Act was to establish and fund research in land grant institutions in every state. Not surprisingly, these initial “land grants” were given to states from the lands acquired through the earliest treaties between the federal government and Indian tribes. The lands that were once the homelands of Native peoples indigenous to North America became the base for what is now the modern land grant research, education, and extension systems.

Land grant universities were expanded by the Hatch Act of 1887, which provided federal funds to establish agricultural experiment stations under the direction of each state’s land-grant college. In 1890, a second Morrill Act provided for historically black colleges and universities. The extension mission of the land grant system was launched by the Smith-Lever Act of 1914, which created cooperative extension system. Early cooperative extension agents were federal employees sent to each county and corner of the country to provide basic services to extend the knowledge and research gains of the land grant institutions to the farmers and communities in rural America. Even today, the original land grant institutions each receive annual federal “formula” appropriations to conduct ongoing research, education and extension; modern funding systems do not rely on federal funds alone but depend on a mix of federal, state and local funding. The Farm Bill authorizes formal funding through the National Institute for Food and Agriculture (NIFA), but also has expansive competitive grants programs and capacity funding as well as intramural funding to USDA research agencies. In 1994, Tribal College and Universities were granted land grant status and subsequent Farm Bills have continued to provide base funding for the research, education and extension functions of these institutions.

.. ————— x ^ x ..

The lands that were once the homelands of Native peoples indigenous to North America became the base for what is now the modern land grant research, education, and extension systems.

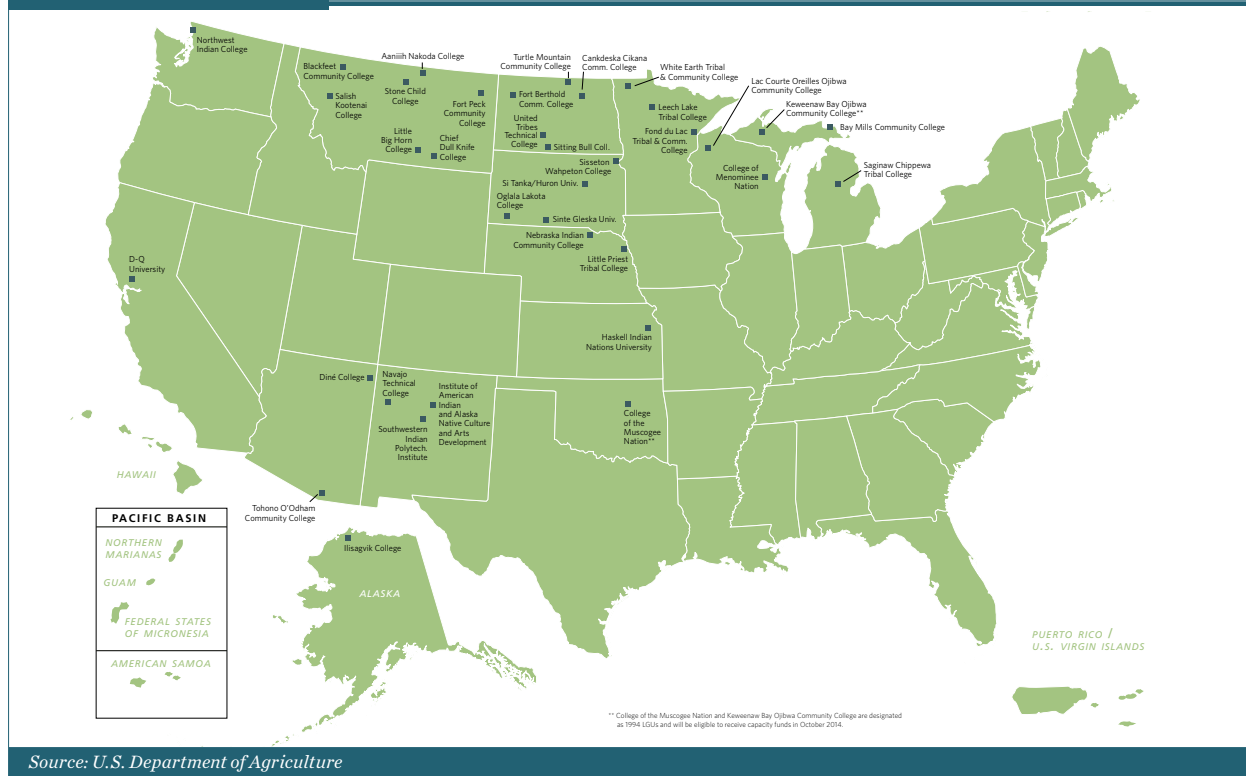

In 2008, USDA research functions were coordinated into NIFA, which funds research and extension among the land grants and other qualifying research institutions. Within the NIFA funding authorities there are more than 100 separate funding opportunities to conduct research, education, and extension throughout the country focusing on key areas of greatest concern. In the 2014 Farm Bill, a program was also created to provide training, education, outreach, and technical assistance to beginning farmers and ranchers. The Title also provides support to the intramural research arm of USDA – the Agricultural Research Service – and the economics research arm of USDA – the Economic Research Service.

In 1994, Congress granted land grant status and funded authority to the first group of Tribal Colleges and Universities (TCUs) in the Research Title, and, in each Farm Bill since 1994, more TCUs have status

as land grant institutions (or 1994s). For example, the 2014 Farm Bill granted status to two additional institutions, and made changes in the name designation to others that had previously been granted land grant status. The 2014 Farm Bill reauthorized sections 533(b), 535(b)(1), 535(c), and 536(c) of the Equity in Educational Land-Grant Status Act of 1994 through 2018 which

reauthorized TCU operating funds, endowments, institutional capacity building, research grants, and the Essential Community Facilities programs – all critical to sustained operation of TCUs. The law also expanded the pool of qualified partners TCUs can join with on research grants to USDA’s Agricultural Research Service, other land-grant colleges or universities, non-land grant Colleges of Agriculture, or cooperating forestry schools. It also extended other research and extension program areas at TCUs; retained the education grants program to institutions serving Alaska Natives and Native Hawaiians; created a new animal health

LAND-GRANT COLLEGES AND UNIVERSITIES: 1994

Source: U.S. Department of Agriculture

research program allowing eligibility to participate in the program for state cooperative institutions and national land grant college of agriculture institutions. The 2014 Farm Bill also created a new competitive grant program for Hispanic workers and youth and included a section of the law that requires matching funds in competitive grant programs but exempts 1994 TCU institutions from those requirements.

In 2014, the Farm Bill created **The Foundation for Food and Agriculture Research**, a nonprofit institution which fosters research and technology transfer through public-private collaborations. It mandated that \$200 million in initial funding for the foundation be matched with outside funds. Additionally, the 2014 Farm Bill broadened support for animal health and disease research and veterinary services and set aside \$5 million per year for capacity and infrastructure grants. Mandatory funding for specialty crops research and extension also increased to \$80 million per year, including at least \$25 million for emergency citrus disease research.

A new pulse crop (legume family) health initiative program that provides grants for youth organizations was created under NIFA authorities. A comprehensive food safety training initiative was created under NIFA's oversight; a pollinator health initiative program was created; and the **Beginning Farmer and Rancher Development Program (BFRDP)** was extended and amended regarding the type of content that could be the subject of training funded by grants. Additional language was included regarding student training programs and set asides for limited resource farmers, socially disadvantaged farmers, and veteran farmers in the beginning farmer and rancher funded programs, all of which could be used to fund tribal programs. The program was increased in funding to \$20 million per year for five years (until 2018). Five percent of the funding was set aside for veteran farmers, and another 5 percent solely for limited resource farmers projects, with new eligibility for competitive funding granted to community and school-based projects. Agricultural and food law research was authorized at the level of \$5 million per year, but it is unknown whether this funding was required to be awarded through a competitive funding process.

The Research title also reauthorizes the **Organic Agriculture Research and Extension Initiative** (OREI) and provides \$100 million over the life of the Farm Bill to support competitive research, extension, and education grants that address key issues facing organic producers. A priority on **farm financial benchmarking**, which will assist producers in analyzing their costs of production at the farm-unit level in relation to others similarly situated was included. Additionally, the **National Sustainable Agriculture Information Service** (more commonly known as ATTRA) and the **Organic Transition Program** were reauthorized. The **Sustainable Agriculture Research and Education Program**'s permanent authorization was removed, and the program is now only authorized through 2018, at which time it will need to be renewed in the next Farm Bill.

There are relatively few Tribal Colleges and Universities, which tend to serve local communities and are predominately two-year institutions. In the early 1990s, the **Federally Recognized Tribal Extension Program** (FRTEP) was created. In 2014, the Manager's Report to the Farm Bill stated as follows: "[D]uring the creation of the Reservation Extension Agent Program, the Congress required the Secretary to consult with Native American farmers and ranchers in establishing Extension programs on Indian reservations and tribal jurisdictions. The Managers understand that changes in the operation of grant programs have impacted this consultation, and expect that the Secretary would find ways to continue the dialogue on the operation of these Extension programs with the populations that they are serving." It is unknown the extent to which this dialogue has been occurring, or what impact it has had on Extension programs in Indian Country.

WHY SHOULD INDIAN COUNTRY CARE?

Agriculture research, education, and extension programs and services throughout the country may seem outdated or irrelevant to many. Food and agriculture research is critical to our food, health,

and self-sufficiency, but the industry only applies to a small segment of society. According to the latest USDA Agriculture Census, there are only 2 million farmers or ranchers in the U.S. Yet agriculture research is important because it monitors and explores old and new knowledge regarding plant and animal health, explores the impact of science to solve food problems, tackles societal issues related to health, and ensures our food supplies are sound and resilient. The reasons for the initial establishment of the land grant research institutions, the original extension services, and research stations are as relevant today as they were many years ago.

But research and extension of knowledge is known throughout the world as playing a "crucial role in agriculture and rural development."

In developing countries, innovation can address most of the challenges facing agriculture and natural resources management. Many developing countries, however, don't have sufficient resources to properly develop their capacity to innovate.³¹

According to the National Sustainable Agriculture Coalition:

Research underpins every aspect of successful and viable farming, whether it's a fifth-generation commodity producer looking to diversify their crop rotation, or a beginning farmer interested in tapping into the huge unmet demand for grass-fed beef.

In comparison to the enormous opportunity that sustainable agriculture represents for farmers and rural communities, federal investment in sustainable agriculture research, education, and extension has been miniscule. Without robust funding for public research that promotes ecologically-based production systems, scientific and technical innovation is stifled, and U.S. farmers and ranchers are unable to fully participate in and benefit from emerging markets for sustainably-produced foods.³²

Indian Country needs to develop its natural resources to build strong and resilient food systems.

Accessing research, building their own research systems within Tribal Colleges and Universities, and supporting educational institutions within communities is critical to stabilizing agriculture production and communities. Being able to continue focusing on the importance of traditional knowledge is best done (and some would argue should only be done) at tribal-owned and managed institutions. Extending knowledge and research outcomes into communities and onto tribal farms, ranches and food businesses is critical to their growth and stabilization. Educating the next generation of producers, scientists, technical specialists, business managers, engineers, lawyers, and the related professionals who advise and support the agriculture and food sectors is critical and making sure that Native youth aspire to those career paths is important to the survival of tribal communities and to creating viable occupations that support food and agriculture sectors in Indian Country. Without the funding in the Research title, this would likely not happen.

EXAMPLES OF OPPORTUNITIES IN THE RESEARCH TITLE

The tragic reality is that the current land grant system, with very few minor exceptions, has never fully engaged with Indian Country. That is not the case for the 1994 Tribal Colleges and Universities who are new members of the land grant family. In the beginning, the land grant system did not engage because its purpose was to support the non-Native communities that settled on Indian lands. More recently, the funding mechanisms that support those research, education, and extension systems have moved from being fully supported by the federal government to being supported by a blend of federal, state, and local funding streams. Because of the unique nature of tribal lands, those institutions

did not feel compelled to serve tribal lands or Native peoples because the systems did not readily see any funding from or on behalf of tribes.

Federal formula funding – which is based on the number of farms and ranches in a state and the number of rural citizens in a state – counts Indian people but does not require the recipients of the federal formula funding to serve Indian people. Enforcing the federal formula funding

and requiring institutions that receive federal formula funds to serve the people who are counted within the formula are important. Placing a simple percentage formula on top of the federal formula funding calculations that is equated to the number of farms in a state that exist on tribal lands and the percentage of Indian people living within the state could be a starting point for applying equity and parity in funding for the benefits of agricultural research, education, and extension. For instance, in a state such as Arizona, where many Native citizens, tribes, and tribal lands are actively involved in agricultural production, farming, and ranching, a significant percentage of agricultural research, education, and extension funding would be spent on tribal-centric projects and efforts.

IAC's main concern within the Research Title has been and remains the equitable funding for extension services and because so many tribes live outside the reach of the extension services provided through the 1862 land grant institutions. To address this, IAC has continually advocated for the proper funding of the **Federally Recognized Tribes Extension Program (FRTEP)**. FRTEP has never received more than \$3 million in annual funding, and FRTEP was inappropriately included in the competitive grant requirement implemented across all federal programs, increasing the difficulty funding for educational programs and capacity building for tribal producers. The original design

.. ————— x  x ..

The reasons for the initial establishment of the land grant research institutions, the original extension services, and research stations are as relevant today as they were many years ago.

of FRTEP called for a team of individuals to work with tribes to design and implement an equitable distribution of 1862 funding to ensure that tribal producers living outside the reach of existing extension agents had access to extension programs. However, further restraints have been placed on the small appropriated amounts as the TCUs seek additional funding and the 1862 institutions seek new funding authorities.

A significant increase in the FRTEP funding must be achieved if the reach of these programs/agents is to be realized, regardless of whether TCUs or 1862s living outside tribal areas are allowed access. If they are, the FRTEP funding will likely “topple” the presence of some FRTEP agents in some locations for more than 20 years. This should not be allowed to occur. During the previous administration, efforts to increase funding occurred annually but these provisions never made it into the final farm bill.

IAC has adopted the following position:

FRTEP: *The Federally Recognized Tribes Extension Programs should be funded at no less than \$10,000,000 annually.*

NCAI supports the following changes in the Research Title:

National Institute of Food and Agriculture, Federally Recognized Tribal Extension Program Increase the Federally-Recognized Tribal Extension Program (FRTEP) to \$6 million. Congress mandates research and extension services in every county in the nation. These services support farmers, natural resources managers, youth (via 4-H youth programs), and communities by providing an FRTEP agent to liaise with other USDA programs, provide training in farm and ranch business management, supervise 4-H and youth development activities, and coordinate special training programs, including application of

new agriculture technologies. While there are more than 3,100 extension offices available to farmers nationwide, fewer than 30 extension agents serve Indian reservations, with current funding of only \$3 million available to 1862 and 1890 Land-Grant Institutions and the University of the District of Columbia. An increase to \$6 million would begin to address this persistent inequity by nearly doubling the FRTEP staff and the number of Native youth served by the program.³³

.. ————— x ^ x ..
The tragic reality is that the current land grant system, with very few minor exceptions, has never fully engaged with Indian Country.

NCAI recommendations as of 2013 included the following,

many of which were included in the 2014 Farm Bill but will need to be carefully monitored and included in the subsequent Farm Bill negotiations. Examples of such reappearing sections include reauthorization of Tribal College land grant status and the inclusion of any new institutions in the list of approved land grant institutions. The funding mechanisms (discretionary vs. mandatory) for each of the policy recommendations that follow were included in the 2014 Farm Bill or will be considered in subsequent bills. These funding mechanisms must be addressed and considered and any necessary or recommended increased levels of funding must be included. **NCAI 2013 Farm Bill recommendations for the Research Title:**

The Research Title supports agricultural research education and extension programs that help farmers and ranchers become more efficient, innovative, and productive. Other types of research programs included biosecurity and response, biotechnology, organic production, food safety, nutrition, and health, and a multitude of related programs.

Tribal Perspective:

The Research Title of the Farm Bill is important to tribes in many ways. The title contains funding for the tribal colleges that Congress has provided land grant status. Important agriculture development and youth development programs are funded through the

FEDERALLY RECOGNIZED TRIBES EXTENSION PROGRAM (FRTEP)

Source: U.S. Department of Agriculture

federally recognized tribal extension program, which albeit does not cover the expanding need in those areas, has assisted in these important areas to address needs for ongoing technical assistance and important leadership development in food and agriculture. Research on the impact of climate change, sustainable agriculture, nutrition and health, food safety, and livestock and plant disease and health are some of the authorities provided in research areas. This combination of programs in research, education, and extension of knowledge are foundational to building strong rural, natural resource-based economies.

1. Tribal Colleges and Universities

In 1994, Tribal Colleges and Universities (TCUs) achieved federal land grant status through the passage of the “Equity in Educational Land Grant Status Act.” Almost two decades later, TCUs are still not recognized or funded as full partners in the nation’s land grant system and, as a result, their potential remains unrealized. The following recommendations for the 2013 Farm Bill aim to address the disparities that exist in the land grant system for TCUs.

A. Reauthorize All 1994 Land Grant Programs³⁴

The following reauthorizations include TCU operating funds, endowment, institutional capacity building grants, research grants, and the Essential

Community Facilities Program. These programs are critical to the sustained operation of TCUs.

Recommendation Provisions

(1) EQUITY IN EDUCATIONAL LAND-GRANT STATUS ACT OF 1994. — The Equity in Educational Land-Grant Status of 1994 (Public Law 103-382; 7 U.S.C. 301 Note) is amended in sections 533(b); 535(b) (1) and (c); and 536(c) by striking “2012” and inserting in lieu thereof “2018”.

(2) TRIBAL COLLEGE ESSENTIAL COMMUNITY FACILITIES PROGRAM. — Amend the Consolidated Farm and Rural Development Act (7 U.S.C. 1926 (A) (25) (C)) by striking “2012” and inserting in lieu thereof “2018”.

B. Update the List of 1994 Institutions

Since the last reauthorization, the roster of TCUs has undergone several changes, including the addition of three schools and several name changes. The list of TCUs needs to be updated accordingly.

Recommended Provisions

(1) DEFINITION OF 1994 INSTITUTIONS. — Section 532 of the Equity in Educational Land-Grant Status Act of 1994 (7 U.S.C. 301 note; Public Law 103-382) is amended — (A) in paragraph (5), by striking “Crownpoint

Institute of Technology” and inserting “Navajo Technical College”;

(B) in paragraph (10), by striking “Fort Belknap College” and inserting “Aaniiih Nakoda College”;

(C) in paragraph (26), by striking “Community”;

(D) by striking paragraph (27);

(E) by re-designating paragraphs (28) through (34) as paragraphs (27) through (33), respectively; and

(F) by adding at the end the following:

“(34) Keweenaw Bay Ojibwa Community College.

“(35) College of the Muscogee Nation.

C. Remove the Funding Ceiling on the Tribal Colleges Education Equity Grants (TCEG) Program intended to strengthen institutional capacity to deliver relevant formal education opportunities, the TCEG program provides funding to enhance education for American Indians in the food and agricultural sciences. The program currently has a ceiling of \$100,000 per TCU, which in many cases has been an inadequate amount. We request that this ceiling be removed.

Recommended Provisions

(1) EQUITY GRANTS AUTHORIZATION CAP. — Section 534(a)(1) of the Equity in Educational Land-Grant Status Act of 1994 (7 U.S.C. 301 note; Public Law 103-382) is amended by striking “an amount equal to —” and all that follows through the end of subparagraph (B) and inserting “such sums as are necessary to carry out this section.”

D. Change the Formula for Distributing the Annual Interest Yield of the 1994 Institutions Endowment
Currently, the statutory formula is based on an institution’s Indian student count, which includes only those students who are enrolled in a federally recognized tribe or who are the biological child of an enrolled tribal member. However, this program benefits both Indian and non-Indian students and community members. Therefore, all students, and not just the members/children of members of federally recognized tribes, should be counted for distributing the annual interest yield among the eligible 1994 institutions.

Recommended Provisions

(1) ENDOWMENT FOR 1994 INSTITUTIONS. — Section 533 (c)(4)(A) of the Equity in Educational Land-Grant Status of 1994 (7 U.S.C. 301 note; Public Law 103-382) is amended by striking “Indian student count” and all that follows through the end of the subparagraph and inserting “full-time equivalent of all students.”

E. Expand the Pool of Qualified Partners for 1994 Research Grants For TCUs to apply for full funding for the Tribal College Research Grants Program (TCRGP), the initial authorizing legislation requires a partnership with 1862 or 1890 land grant institutions that are authorized under the original and amended 1862 legislation. Under the Cooperative Forestry Act of 1962 (known as McIntyre-Stennis), there are some McIntyre-Stennis designated forestry schools eligible for land grant funding that are located at non-land grant institutions. The 1994 institutions have not yet submitted a grant proposal that includes a partnership with a non-land grant McIntyre-Stennis designated forestry school; however, it appears that a strict interpretation of the TCRGP RFA could result in disqualification of a proposal that includes such a partnership. It may also be in the best interests of the 1994 institutions to foster research relationships with federal research installations (e.g. ARS Research Centers), and non-land grant institutions, and the TCRGP is often TCUs’ only avenue to expand research relationships.

Recommended Provisions

(1) RESEARCH GRANTS. — Section 536 of the Equity in Educational Land-Grant Status Act of 1994 (7 U.S.C. 301 note; Public Law 103-382) is amended in subsection (b) by striking “at least 1 other land-grant college or university (exclusive of another 1994 Institution)” and inserting “the Agricultural Research Service of the U.S. Department of Agriculture or with at least 1 other land-grant college or university (exclusive of another 1994 Institution), non land-grant College of Agriculture (as defined in section 1404(14) of the National Agriculture Research, Extension, and Teaching Policy Act of 1977 (7 U.S.C. 3103)), or cooperating forestry school (as defined in

section 1404(5) of the National Agriculture Research, Extension, and Teaching Policy Act of 1977 (7 U.S.C. 3130)).”

F. Provide Agriculture and Food Sciences Facilities and Equipment at 1994 Land-Grant Institutions, Consistent with Existing Programs for Non-Tribal Institutions

Nearly all the remaining tribal land in North America is forest or agricultural land. In fact, of the 72.8 million acres that comprise Indian reservations, more than 75 percent are agricultural and forestry holdings. Yet, the 1994s are the only land-grant institutions without this type of program, which is essential for conducting up-to-date research and developing strong agriculture and natural resource workforces. The proposed program is like respective long-standing programs for the 1890, District of Columbia, and Insular Area Land-Grant Institutions.

Recommended Provisions

The Equity in Educational Land-Grant Status Act of 1994 (7 U.S.C. 301 note; Public Law 103-382) is amended by inserting the following new section at the end thereof:

SEC. 537. GRANTS TO UPGRADE AGRICULTURE AND FOOD SCIENCES FACILITIES AND EQUIPMENT AT 1994 LAND-GRANT INSTITUTIONS.

(a) PURPOSE. — It is the intent of Congress to assist 1994 land-grant institutions in efforts to acquire, alter, or repair facilities or relevant equipment necessary for conducting agricultural research.

(b) METHOD OF AWARDED GRANTS. — Grants awarded pursuant to this section shall be made in such amounts and under such terms and conditions as the Secretary determines necessary to carry out the purposes of this section.

(c) REGULATIONS. — The Secretary may promulgate such rules and regulations as the Secretary considers to be necessary to carry out this section.

(d) AUTHORIZATION OF APPROPRIATIONS. — There is authorized to be appropriated to carry out this section \$15,000,000 for each of fiscal years 2013 through 2018.”³⁵

The Research Title is the portion of the Farm Bill which holds the greatest areas of promise for improving tribal food systems.

.. ————— x Λ x ..
Tribal College research and education programs need a considerable funding increase to meet the growing needs of tribal food systems and food producers.

Research Title Funding Mechanisms

The competitive and formula funding mechanisms within the Title can provide much-needed research and development, critical infrastructure development, education, and extension of knowledge. But assumptions about the funding

systems have outlived their usefulness.

TCU Eligibility for all NIFA Funding

It is not acceptable that TCUs are not eligible for all USDA-NIFA funding authorities. FRTEP agents are not present among enough tribes, and they are not provided even the minimum level of funding to accomplish their work.

Additional Resources for Tribal College Extension Programs

- Tribal College extension programs receive too little funding to be as effective as they need to be. Tribal College research and education programs need a considerable funding increase to meet the growing needs of tribal food systems and food producers.
- Extension programs funded at 1862 institutions are not required to provide services to tribal food systems. Educational scholarships, internships, and critical needs are not being met. The growth of Native food systems requires the improvement of access and parity within the Research Title.
- A comprehensive study to explore the potential ability of 1862 land grant institutions to share administrative functions, classroom and faculty resources, and other related support mechanisms.

Tribal Set-Aside, Preference, and Funding at NIFA

- Providing tribal set-asides and preferences within all NIFA funding authorities while retaining the competitive nature of the funding is necessary to continue building capacity and strength.
- The agricultural legal funding authority contained in the 2014 Farm Bill must be amended to ensure that competition for the funds occurs and that there is a set-aside of the funding available to be provided to organizations and entities that have a proven specialty and primary focus on Indian law issues, as those issues intersect with food and agriculture law.
- NIFA funding authorities must focus a portion of their work on building knowledge and capacity in business development unique to tribal lands which must be approached separately due to the unique complexities in land use, law, regulatory burdens and related issues. Business training and the development of solid business planning tools are necessary. This funding is best focused around risk management education programs and the funding authorities that allow funding for business development.
- Tribal governments and tribal organizations should all be allowed full access to all nutrition education programs at NIFA, including SNAP-Ed and all research programs related to building knowledge in nutrition, health, obesity, and diabetes prevention.
- Small Business Innovation Research projects funded through NIFA should include a set-aside for tribal projects leading for commercialization of food products or food systems innovations.

Sustainable Agriculture Research and Education Program

If the Sustainable Agriculture Research and Education Program is reauthorized, it should include a set-aside for tribal sustainable agriculture project funding.

Agricultural Research Service Projects on Traditional Ecological Knowledge

The Agricultural Research Service must launch and support a significant number of research projects that focus on the important and increasing role that traditional knowledge plays in the environmental and natural resource and ecological arenas as well as the food science, nutrition, and health arenas.

Multi-Tribal Funding for Research Title Programs

A separate funding authority like the Sun Grant or Sea Grant authorities should be developed that allow multi-tribal, multi-state, and consortium approaches to meeting the research, education, and extension needs of Indian Country.

Native Youth Grants

Grants for youth organizations must include the provision of grants for youth organizations in Indian Country that focus on developing food and agriculture leadership and scientific knowledge programs.

TCU Center of Excellence

The Centers of Excellence approach to funding should be encouraged, allowed and included in the next Farm Bill Research Title, if desired by TCUs.

TITLE VII: FORESTRY

The 2002 Farm Bill created the first Forestry Title. The Agriculture Committees have jurisdiction of the U.S. Forest Service, which is part of USDA, but the Department of the Interior has jurisdiction of most federal land and forestry programs. The Forestry Title is a small part of the Farm Bill, but other forestry programs appear in other titles, especially in the Conservation Title. While the Forestry Title is clearly not the oldest or largest title to the Farm Bill, it is important to many tribes whose lands and communities are interdependent with the Forest Service lands. Natural Resources Conservation Service and the U.S. Forest Service are sister agencies within the Environment and Natural Resources mission area of USDA.

In the 2014 Farm Bill, the Tribal Watershed Forestry Assistance Program, the Forest Land Enhancement Program, and the Watershed Forestry Assistance Program were repealed. The U.S. Forest Service decision making and appeals process was changed: if an action was part of a forest planning process it became a non-appealable and was not subject to National Environmental Policy Act (NEPA) planning processes. As implemented over time, this provision could have impact on tribes and should be watched closely. The cooperative forestry assistance program with states was reauthorized and the rural revitalization programs contained within the Forest Service were also extended. The Healthy Forests Reserve Program was extended and included tribal-specific provisions. In Section 8 of the Manager's Report, a clarification of the definition of "Indian lands" was included as was discussion about the impact of increased participation in the Natural Resources Conservation Service managed **Healthy Forests Reserve Program**. The 2014 Farm Bill increased appropriations authorization for the Healthy Forests Reserve Program and allows the funds to be used to provide technical assistance, management, and enforcement services for lands enrolled in the program. The language also defines acreage owned by Indian tribes as being eligible for participation in the program.

The bill also included language requiring USDA, at the request of a state governor, to designate treatment areas on at least one national forest in each state, if such lands are experiencing declining forest health and disease infestation and authorized up to \$200 million to carry out these forest land treatments. The Title also contains language related to forest roads, signifying that forest roads are not to be considered point sources of pollution; this provision gives legislative weight to a U.S. Supreme Court ruling and the Environmental Protection Agency's position that forest roads are not subject to regulation under the Clean Water Act. It created a program that allows a fee to be assessed on home-grown and imported Christmas trees. The funds from the assessment will be used to market and promote Christmas trees grown on U.S. soil.

Forest products may qualify as "biobased" products for the purposes of federal law. The 2008 Farm Bill allowed products containing as little as 25 percent biobased content to qualify for incentives under the BioPreferred Program, but excluded some traditional wood and forest products with up to 100 percent biobased content.

Section 8301 of the Forestry Title called on the Forest Service to revise its current strategic plan for forest inventory and require its analysis to include an urban forest. The bill permanently authorized **Stewardship Contracting** and added fire liability provisions to stewardship contracts and agreements. The International Forestry program was reauthorized through Fiscal Year 2018. The **Forest Inventory and Analysis** program was amended to include interior Alaska in the program, implementing an annualized inventory of trees in urban settings, and took many other measures to strengthen forest data collection, analysis, strategic direction, and reporting on changes in land cover and use.

The bill also allowed the "**Good Neighbor Authority**" to become available in states with

National Forest System or Bureau of Land Management (BLM) lands. Piloted in Utah and Colorado, this authority allows the Forest Service or BLM to enter into agreements with state foresters to carry out forest, rangeland and watershed restoration, management, and protection services on National Forest Service lands. The bill allows this authority to include projects involving commercial harvesting or other mechanical vegetative treatments but excludes other activities such as road construction. The bill also establishes a USDA Forest Service **Large Air Tanker and Aerial Asset Firefighting Lease Pilot Program** and clarifies authorities to facilitate a national, coordinated response to wildland fire.

WHY SHOULD INDIAN COUNTRY CARE?

Since it was established in 1976 as a nonprofit tribal consortium, the Intertribal Timber Council (ITC) has been at the forefront of forestry issues in Indian Country. ITC's vision is that "Indigenous stewardship of natural resources supports thriving, fully empowered communities that share success in exercising sovereign decision-making, create sustainable economies and implement strategies that perpetuate forest health for generations to come." They also state: "Forest resources are vital to the economic and social welfare of many Indian nations and [N]ative Alaskan Corporations. The management of these valuable and renewable natural resources not only provides income and employment opportunities for our people, but also affects our lives in many other ways. The harmony of man, trees, and other vegetation, soil, water and wildlife which collectively comprise the forest community influence our very emotional and spiritual well-being."³⁶

Indian forests and woodlands comprise 18.6 million acres, or one third, of the total 57 million acres of Indian land held and managed in trust by the federal government. Forests are one of the principal renewable resources available to tribes, and more than 300 Indian tribes have forest resources. Across

the country, Indian forests provide more than \$40 million in annual tribal governmental revenues, 19,000 jobs in and around tribal communities, as well as wildlife habitat and sources of food and medicine for Indian people. The proper health and management of Indian forests are crucial to rural economies across America.

Many American Indian and Alaska Native tribes have long-standing and deeply spiritual relationships with the forests within which they lived for centuries. Their deep engagement with forests of North America was fundamentally changed upon European contact when the relationships they had with the land, including forests, became severed. The United States Forest Service now maintains National Forests that co-exist within and among the boundaries of current and historic tribal homelands.

EXAMPLES OF OPPORTUNITIES IN THE FORESTRY TITLE

Since many tribes either live within the jurisdiction of federal agencies with forest responsibilities (primarily the U.S. Forestry Service at USDA), or have trust and treaty rights resources located on federal forest lands, the intensely specific and expertise-dependent issues around forests require a specialized eye towards policy change.

ITC has put forward the following recommendations:

Tribal Forest Protection Act (TFPA)

The Tribal Forest Protection Act (TFPA) (Pub. L. No. 108-278), enacted in 2004, authorizes tribes to work on a priority basis with the U.S. Forest Service (USFS) and Bureau of Land Management (BLM) on forest health projects on USFS and BLM lands adjacent to tribal forests to help protect tribal forests from threats from those USFS and BLM lands. The legislation passed both Chambers unanimously. But, in the over 13 years since its authorization, relatively few TFPA projects have been implemented, even

though, in recent years, the ITC and tribes have been working with the U.S. Forest Service to try to improve implementation. The disappointingly slow implementation of the TFPA continues to thwart the Act's intention, leaving tribal forests more vulnerable to catastrophic wildfire, disease and infestation from adjacent federal public lands.

To help overcome resistance to TFPA implementation, four bills in the 114th Congress included provisions to add time lines to USFS and BLM consideration of TFPA project requests and to allow greater direct tribal participation in TFPA project implementation. The four 114th Congress bills were: the House-passed Resilient Federal Forests Act (H.R. 2647, Rep. Westerman); the very similar Senate Emergency Wildfire and Forest Management Act (S. 3085, Sen. Roberts, referred to the Senate Agriculture Committee); the Tribal Forestry Participation and Protection Act (S. 3014, Sen. Daines), which was approved by the Senate Indian Affairs Committee; and the House-passed version of S. 2012, the Energy Policy Modernization Act.

The ITC requests that the upcoming Farm Bill improve the TFPA by including the following:

- Include the TFPA streamlining provisions to improve the timelines for review and implementation of forest restoration projects requested by tribes (from the 114th Congress, see H.R. 2647 Section 301 (Westerman), S. 3085 Section 501 (Roberts), S. 3014 Section 2 (Daines), and S. 2012 House version Division B Section 701).
- Allow greater tribal participation in TFPA projects by authorizing, as a discretionary pilot program, the application of the Indian Self-Determination and Education Act (PL 93-638) contracting authority to TFPA projects on USFS or BLM lands (from the 114th Congress, see H.R. 2647 Section 303 (Westerman), S. 3085 Section 503 (Roberts), S. 3014 Section 4 (Daines), and S. 2012 House version Division B Section 703).

The legislative text for both the above provisions is virtually identical in the four bills. To ease review and selection, the ITC suggests that the legislative text from H.R. 2642 (Westerman) Sections 301 and 303 be adopted into the new Farm Bill.

Cooperative Management of Adjacent Federal Lands

Tribes continue to have legal, historic and economic connections to adjacent federal forests. The ITC supports pilot authorization of tribes and the Bureau of Indian Affairs to conduct cooperative, discretionary forest restoration activities on U.S. Forest Service and BLM lands using existing regulations governing the management of Indian forests. Bicameral consideration of and support for such a program was demonstrated during the 114th Congress in the four bills in the above TFPA discussion.

.. ————— x ^ x ..

Many American Indian and Alaska Native tribes have long-standing and deeply spiritual relationships with the forests within which they lived for centuries.

The ITC requests that the Farm Bill contain pilot authorization similar to that found in Section 302 of the House-passed H.R. 2647 (Westerman, 114th Congress) and Section 3 of S. 3014 (Daines, 114th Congress), which was favorably ordered reported by the Senate Committee on Indian Affairs.

Workforce Development

There is a growing shortage of trained workers for the management and operation of Indian forests. The need to recruit, train, and retain a future forestry and fire workforce has been identified by an independent panel of scientists (Indian Forest Management Assessment Team) tasked by Congress to review the management of Indian forests every 10 years. This shortage of forest workers is already constraining the ability of Indian tribes and related federal agencies, such as the Bureau of Indian Affairs, to effectively manage and protect tribal forests and forest-related natural resources and to participate in broader landscape based forest management activities. The personnel shortage for Indian forestry is currently so severe that only half

the national tribal harvest (as described in approved sustainable management plans) can be generated.

The ITC requests that the Farm Bill authorize USDA to fund a Native American forestry workforce coordination and development program through an intertribal organization familiar with tribal forestry issues.

McIntire-Stennis Parity

As mentioned earlier in the Research Title, the McIntire-Stennis Act of 1962 (Pub. L. No. 87-788) dedicates funds to states to pursue forestry research at state colleges and universities and to help train the next generation of forest scientists and professionals. All 1862 land grant institutions were eligible for these funds when the Act was initially passed and the 1890 Historically Black Colleges and Universities were granted access in the 2008 Farm Bill. In Fiscal Year 2016, USDA NIFA made just under \$32 million available through McIntire-Stennis to land grant and public universities in the 50 states, Puerto Rico, Guam, and the Virgin Islands.

Despite the fact that tribal trust lands are included in the formula that allocates funding to the individual states, the 1994 Land Grant Tribal College and University institutions (TCUs) remain ineligible to receive research funding. The ITC believes that parity should be granted to TCUs with a bachelor's degree in forestry or higher, and that this would allow tribal colleges to perform tribally and state-relevant forestry research and develop a well-trained Native forestry workforce.

Fire Suppression Priorities

To the extent that the Farm Bill addresses federal wildfire suppression efforts, the ITC would like to work with the committees to ensure that Indian forests are properly prioritized in fire suppression activities and funding. Current priorities place protection of private structures above protection of tribal forest assets held, managed and protected by the U.S. as trustee. As a result, in the 2015 fire season, suppression crews were removed from wildfires on Indian trust forests in order to protect private structures. The fires on

Indian trust forests exploded, destroying hundreds of thousands of acres and millions of board feet of timber vitally important to tribal economies. The ITC believes that such priorities, allowing federally protected trust assets essential to tribal governments and communities to be sacrificed to protect private structures, need a review.

Anchor Forests

The ITC, member tribes, the U.S. Forest Service, and other forest resource stakeholders have recently completed a pilot study in Washington State and report on an "Anchor Forest" concept to foster landscape-scale forest collaboration and management projects intended to improve forest health while preserving local logging, milling and other critical infrastructure. Tribes in the Great Lakes states and Southwest have expressed interest in Anchor Forest projects in their own regions.

Below are recommended provisions from the 2013 NCAI recommendations, updated to reflect the current priorities of the ITC:

a) SEC. XXX. ANCHOR FOREST PILOT PROGRAM AUTHORITY.

(a) Findings.

(1) Economic benefits from harvest of wood products are an essential element of land stewardship needed to address forest health problems on federal lands and to sustain stewardship practices on private, tribal, and state forests across the landscape.

(2) Minimum levels of harvesting, manufacturing, processing, transportation and work force infrastructure must be identified, maintained and improved if objectives such as healthy forests, viable rural forest-dependent communities, ecosystem (environmental) services, and bioenergy development are to be achieved.

(3) Currently, harvesting and processing infrastructure is in a critical state of decline. Once these human and physical resources disappear, they will be very difficult to replace.

(4) Without access to markets for forest products, without the ability to prepare and implement management prescriptions, without a work force,

processing facilities, and the means to transport wood to markets, without the income generated from harvest to defray costs of forest health treatments at the scale required, forests are facing the prospect of increasing losses from insects, disease, wildfire, conversion and climate change.

(b) Purpose. The purposes of this section are to –

(1) develop and maintain sustainable healthy and productive working forests on the landscape,

(2) develop, preserve and strengthen the long-term jobs and other forest based infrastructure in rural timber-dependent communities,

(3) recognize, identify and foster the mutual benefits of healthy working forests on the landscape and the rural timber communities that provide the jobs, processing facilities and other infrastructure that contribute to the health and productivity of those forests,

(4) establish an Anchor Forests Pilot Program that

(A) identifies large landscape-based forest lands

(i) needing improvement or maintenance of the forest's health and productivity and

(ii) needing the development, improvement or preservation of forest management, harvesting, transportation, and processing infrastructure critical to improving and maintaining the forests' health and productivity,

(B) authorizes and supports unified or coordinated, flexible, and cohesive management of Forest across jurisdictional boundaries to enable the long-term efficient, and effective health treatments, provide ecosystem services, and reliable, sustainable production of forest products to timber dependent rural communities,

(C) authorizes and supports the development, maintenance, and improvement of the forest management and forest products processing infrastructure needed for forest health and productivity.

(c) Establishment of program. There is established an Anchor Forest Pilot Program to be implemented by the Secretary of the Interior and the Secretary of Agriculture, in consultation and coordination with appropriate Indian tribes and in coordination with appropriate intertribal organizations.

(d) Number of pilot projects, duration. Anchor Forest Pilot Program implementation is to consist of twelve

pilot projects, of which not less than three and not more than five pilot projects are to have Indian forest land as a principal land component, with each project to continue for up to fifteen years.

(e) Components of each pilot project. Each Anchor Forest Pilot Program pilot project consists of the following elements:

(1) Anchor Forest. Each pilot project will have a designated Anchor Forest land base identified from National Forest, and/or BLM forest lands and, subject to voluntary application in a manner the appropriate Secretary shall prescribe, tribal, state and private forest land that –

(A) is committed to long-term sustainable management and production of forest materials to supply Anchor Forest Infrastructure as described in (c)(2), and

(B) collectively is of such size, proximity and composition to assure a sustainable amount of forest material to support economically viable operation of the Anchor Forest Infrastructure described in (c)(2) and maintain the health and productivity of the Anchor Forest.

(2) Anchor Forest Infrastructure. Each pilot project will identify its Anchor Forest Infrastructure, upon which the Anchor Forest principally depends for the conduct of its active management operations, and which can include –

(A) a local labor force capable of performing forest planning, analysis, and management activities on a landscape scale,

(B) transportation systems for, among other activities, access to the forest, removal of forest materials to processing locations, and distribution of processed forest materials to markets, and

(C) forest material processing and manufacturing facilities.

(f) Collaboration. In each Anchor Forest Pilot Program pilot project, personnel and officials from the federal agencies, Indian tribes, state, and private forest lands included in the pilot project are to coordinate and collaborate on the development and realization of common vision, goals, and objectives for the pilot project, supported by a single long-term management plan or uniform long-term management plans, inventory systems, designated professional staff, and geographic information systems.

(g) Assistance. The Secretary of Agriculture and the Secretary of the Interior are authorized –

(1) From funds appropriated for the programs and activities of, respectively, the Department of Agriculture and the Department of the Interior to provide support for any Anchor Forest management or operational activity and for the development, support, operation, maintenance, and improvement of Anchor Forest Infrastructure. Such support may be in the form of grants, loans, and loan guarantees.

(2) To provide directly or through other parties' technical assistance to participating Indian tribes, states, private land owners, or other participating parties for activities related to Anchor Forest and Anchor Forest Infrastructure.

(3) To enter stewardship contracts and other agreements and contracts, and, notwithstanding any law, to fashion such other arrangements or management directives as needed, to foster and support sustainable Anchor Forests and Anchor Forest Infrastructure.

(h) Regulations. The Secretary of Agriculture and the Secretary of the Interior, in collaboration with likely affected parties, shall develop and promulgate regulations implementing this Section within 180 days of enactment.

G. Change the name of USFS State and Private Forestry to "Tribal, State, and Private Forestry"

It is suggested that the Farm Bill direct the name change of U.S. Forest Service "State and Private Forestry" (S&PF) to "Tribal, State and Private Forestry." S&PF, charged with working with nonfederal entities, has included the Office of Tribal Relations since its inception in 2003. The name change is needed to honor government-to-government relationships and to acknowledge the USFS's trust responsibilities and increasingly important engagement with tribal governments. A legislative change is needed because the USFS has been reluctant to make the change on its own volition.

Recommended Provision

a) SEC. XXX. RENAMING U.S. FOREST SERVICE MISSION AREA TO "TRIBAL, STATE AND PRIVATE FORESTRY".

The organizational portion of the United States

Forest Service described as a Program Mission Area now named "State and Private Forestry" is hereby renamed "Tribal, State and Private Forestry".

I. Congress should protect Indian sacred places in National Forest System.

Lands found within the National Forest System were formerly ancestral lands of Indian tribes. The historical, religious, spiritual, cultural, and traditional connections of Indian tribes to these lands have not been extinguished despite changes in title. The United States has a fiduciary and moral responsibility to preserve and protect Indian sacred places located on federal lands.

The spirit and direction of the Nation are founded upon and reflected in its historic heritage. The historical and cultural foundations of the Nation should be preserved as a living part of our cultural and community fabric. Indian sacred places are important not only to Indians and Indian tribes but also to the Nation so that its heritage is not lost or substantially altered. The preservation of this irreplaceable heritage is in the public interest so that its vital legacy of cultural, religious, educational, aesthetic, and inspirational benefits will be maintained and enriched for future generations of Americans.

Recommended Provisions

SUBTITLE E – Miscellaneous Provisions- [INSERT NEW SECTION 8403:]

"SECTION 8403 – Indian Sacred Places

a) DEFINITIONS – In this subtitle:

(1) INDIAN – The term 'Indian' means an individual who is a member of an Indian tribe.

(2) INDIAN TRIBE – The term 'Indian tribe' means any Indian or Alaska Native tribe, band, nation, pueblo, village, or other community the name of which is included on a list published by the Secretary of the Interior pursuant to section 104 of the Federally Recognized Indian Tribe List Act of 1994 (25 U.S.C. 479a-1).

(3) NATIONAL FOREST SYSTEM – The term 'National Forest System' has the meaning given the term in section 11(a) of the Forest and Rangeland Renewable Resources Planning Act of 1974 (16 U.S.C. 1609(a)).

(4) INDIAN SACRED PLACE – The term ‘Indian sacred place’ means an area or location, including geological features, landscapes, bodies of water, traditional cultural properties, and sites, in the National Forest System that is identified by an Indian tribe, or Indian individual determined to be an appropriately authoritative representative of an Indian religion, as having long-established significance in Indian religious, ceremonial, or traditional cultural practices; provided that the Indian tribe or appropriately authoritative representative of an Indian religion has informed the Secretary of the existence of such as a place.”

b) Protection of Indian Sacred Places

(1) The Secretary shall protect Indian sacred places in the National Forest System by preserving their physical integrity and ensuring no adverse impacts to them.

(2) The Secretary shall engage in government-to-government consultations with Indian tribes to ensure proper protection of Indian sacred places.

(2) The Secretary shall ensure access for Indians and Indian tribes to Indian sacred places in the National Forest System.

(3) The Secretary shall not dispose of or convey National Forest System land on which an Indian sacred place is located unless the Secretary has offered to transfer this land first without cost to the Indian

tribe whose sacred place it is.

c) Confidentiality – Notwithstanding any other provision in law, the Secretary shall not disclose information provided by Indian tribes or Indians about Indian sacred places to others to protect these places.³⁷

Additional opportunities for forestry initiatives include:

- Ensuring that the interdepartmental efforts to protect Indian sacred places are maintained and strengthened under future administrations, and that the responsibilities of USDA and other federal departments to consult with tribes on an ongoing basis concerning sacred places continually occurs.
- USDA should require that tribal representation continues with all local, regional, and national planning and implementation bodies which serve in advisory capacities to USDA and the U.S. Forest Service.
- Create parity between Forest Service management agreement language and NRCS determination of land control language, which preserves tribal sovereignty and rights to gather/manage traditional plant stands and enhances opportunities for tribes to leverage EQIP assistance on traditional lands under Forest Service jurisdiction.

TITLE IX: ENERGY

The Energy Title made its first appearance in the 2002 Farm Bill. Since that time, its importance depends largely on how much of a focus the current Congress or Administration has on the nation's energy supplies and resources. The Title generally authorizes programs that encourage investments in alternative energy technology, production of renewable biomass for biofuels, education, research, financial assistance, and the manufacture and production of renewable energy.

Regardless of who is in office, energy use in agriculture is a serious and increasingly important issue. Hundreds of years ago, agriculture used energy from natural resources and processes. But as agriculture has changed and modernized over time, so has its energy consumption. Agricultural energy use now can be found in fertilizer production and use; water consumption and use; farm equipment; processing; packaging; distribution; and transportation. Agricultural water use alone makes up a significant financial investment for producers and moving water across production landscapes can be energy-intensive.

The need for renewable energy, increased sources of domestic energy, and the impacts that energy access disruptions have in sensitive agriculture markets call for the inclusion of an Energy Title in the Farm Bill. Interest in the ethanol industry (the use of crops for energy use) has grown over time, and biofuels development, energy efficiency, and carbon capture continue to generate high levels of interest even in the years when agricultural energy policies wane.

Some mandatory funds have been used in the Energy Title since its inception, but today the programs in the Title are subject to annual appropriations, making them more insecure over time. Forest products are included in bioenergy programs such as BioPreferred and other biobased programs. **The Rural Energy for America Program (REAP)** was extended and amended in the 2014 Farm Bill; biobased market programs

were extended and amended, and the **Biorefinery Assistance Program** was included in the bill. The **Biomass Research and Development Initiative** was extended and amended, and the **Feedstock Flexibility Program** for biomass producers was also extended and amended. The **Biomass Crop Assistance Program (BCAP)** was extended and amended with \$25 million in mandatory funding authorized annually. This program provides financial assistance to owners and operators of agricultural and non-industrial private forest land who wish to cultivate biomass feedstock for sale to energy producers. Provisions in the 2014 Farm Bill allowed expiring CRP acres to be enrolled in the BCAP program and included as "eligible material" collected or harvested from National Forest System and BLM lands in addition to non-federal lands. Eligible materials under the **Biomass Crop Assistance Program (BCAP)** now include material collected or harvested directly from the National Forest System, Bureau of Land Management land, non-federal land, and tribal lands in a manner that is consistent with Conservation Stewardship Program plans. Eligible materials also include woody material that is a byproduct of preventative treatment on non-contract acreage or harvested from federal land in accordance with the Healthy Forests Restoration Act of 2003. BCAP now allows enrollment of land under Conservation Reserve Program (CRP) or Agricultural Conservation Easement Program contracts that are set to expire in any given fiscal year.

In the 2014 Farm Bill, the biorefinery program was renamed the **Biorefinery, Renewable Chemical, and Biobased Product Manufacturing Assistance Program**. It will continue to offer loan guarantees for renewable energy projects such as the construction and retrofitting of refineries to develop and produce advanced biofuels. The new bill expands the program to assist the promotion of renewable chemicals and biobased manufacturing production facilities. Funding for this program is discretionary, with \$75 million in funds set aside through 2018.

REAP emerged with a permanent funding baseline, meaning that even if Congress fails to reauthorize the Farm Bill again in five years, it will continue with \$50 million in mandatory funding per year. REAP helps agriculture producers and business owners in rural areas invest in energy efficiency and renewable energy. The program was amended to include a three-tiered loan and grant program.

The **Biobased Markets Program** was amended to include forest products and allows assistance to landowners to determine whether products are eligible for the “USDA Certified Biobased Product” label. Community Wood Energy Program, which allows small grants to provide seed capital for biomass consumer cooperatives to build stronger markets for biomass heating products, was reauthorized through 2018. Additional programs were retained, and some were reconfigured in the bill. This is likely going to be the case as future Congresses reexamine not only agriculture’s dependency on energy (and what source of energy), but also the nation’s energy future.

WHY SHOULD INDIAN COUNTRY CARE?

Energy projects in Indian Country hold immense promise for diversifying tribal economies while bringing much-needed energy systems to remote and isolated communities. Growing crops for energy purposes or converting natural resources on tribal lands to bio-energy projects is an important tool for economic development and self-sufficiency. In addition, if bio-energy projects could focus on the needs of remote tribal food producers and embrace the importance of research and development of products and systems on tribal lands, important tribal goals can be met.

EXAMPLES OF OPPORTUNITIES IN THE ENERGY TITLE

In 2013, NCAI recommendations for change in the Energy Title included:

This title supports the development of farm and community renewable energy systems through various programs, grants, and procurement assistance initiatives. Provisions covered the

.. ————— x Λ x ————— ..

Energy projects in Indian Country hold immense promise for diversifying tribal economies while bringing much-needed energy systems to remote and isolated communities.

production, marketing, and processing of biofuel feedstocks; expanded research, education, and demonstration programs for advanced biofuels; USDA coordination of federal bio-based energy efforts; grants for procurement of bio-based products to support development of bio refineries; assistance for eligible farmers, ranchers, and rural small businesses in purchasing renewable energy systems; and use education

programs, among other programs. The title continues and expands funding for federal agency procurement of bio-based products, construction and development of advanced biofuel refineries, biomass research and development, and biodiesel education. New programs encourage renewable energy use by bio refineries, renewable energy systems and energy efficiency improvements, rural energy self-sufficiency, development of next generation feedstocks, and use of forest and woody biomass for energy production.

Tribal Perspective:

Indian Country lays claim to countless acres of renewable energy resources. However, to develop and own renewable projects themselves, tribes and tribal entities do not now have funded or authorized incentive programs or tools to competitively finance renewable energy projects, nor are they able to efficiently utilize the existing federal incentives, including tax credits which traditionally finance energy development in the private sector.

ENERGY INVESTMENT MAP

INVESTMENT BY STATE (\$ MILLIONS)

Source: U.S. Department of Agriculture

1. Congress should add a new section to Title IX that would allocate funding for tribal Energy Bio-Based Energy Development Grants

A Tribal Energy Bio-Based Energy Development Grant would operate much like a grant-in lieu of tax credit and would be specifically available to Indian tribal governments and wholly owned tribal entities and operate similarly to the existing Renewable Energy Production Incentive (REPI) Program which is tied to the base and escalation authorities of the authorized production tax credit (PTC) for wind. The law should also clarify eligibility of tribally chartered and federally chartered tribal corporations for Rural Development Programs, including grants and loan programs and any technical assistance programs available. The Department of Agriculture has made a policy statement that it will recognize federally

chartered Section 17 Tribal Corporations as eligible entities for the RD programs. Legislation should codify this as well as clarifying that tribally chartered tribal corporations are likewise eligible.³⁸

No additional provisions are necessary beyond those advocated by NCAI. Every effort should be made to ensure that all energy-related programs created by future Farm Bills provide for several key issues: (1) tribal production of bioenergy crops is not prevented under the Farm Bill; (2) tribal interests in alternative energy projects are protected and supported by future Farm Bills; (3) tribal biobased products are included in any applicable efforts that increase such products in the marketplace; and (4) tribally chartered entities are included in all grant and technical assistance programs.

TITLE X: HORTICULTURE

First appearing in the 2008 Farm Bill, the Horticulture Title supports specialty crop and organic farming operations with provisions that provide trade promotion and risk management assistance. Funding for pest and disease management and disaster prevention was specifically increased in the 2014 Farm Bill. According to USDA, sales of specialty crops account for nearly one-third of U.S. crop cash receipts and one-fifth of U.S. agricultural exports.

In the 2014 Farm Bill, farmer’s market and local foods promotion programs were extended and expanded, providing grants to farm-to-institution, food hubs, and local/regional food aggregation, storage, distribution and similar activities. The bill authorized \$30 million in mandatory annual funding, with 50 percent going to direct marketing and 50 percent going to non-direct marketing of regional food enterprise activities and supply chain activities. The bill required the Secretary to issue regulations concerning bulk shipments of apples to Canada. It also expanded the fresh fruit and vegetable program for schools and created a pilot to evaluate inclusion of canned, frozen, or dried fruits and vegetables in the program. The funding also included initiatives for technical assistance for specialty crops in the Trade Title that would address sanitary, phytosanitary, and technical barriers to specialty crop exports.

In the Research Title, competitive grants were awarded with the Specialty Crop Research Initiative to focus on scientific research and activities, technical assistance, and development to combat citrus diseases and pests (Emergency Citrus Disease Research and Extension Program).

In addition, pilot programs to explore the procurement of unprocessed fruits and vegetables and canned, frozen, or dried fruits and vegetables

were allowed in a small number of states’ school lunch programs to evaluate impacts on school participation in the program. These programs examine geographic preference and use of multiple suppliers to facilitate more local fresh fruit and vegetable offerings.

The bill also reauthorized the **Tree Assistance Program** (TAP) with mandatory funding for disaster assistance for tree crops, vines, and bushes in designated disaster areas. Assistance may cover up to 65 percent of the cost of replacing trees and up to 50 percent of the cost of salvaging damaged trees or preparing land for replanting. The **National Clean Plant Network** was created and funded to produce clean plant material (free of

pests and diseases) and maintain blocks of pathogen-tested plant material in sites throughout the United States for pathogen diagnosis and elimination.

Organic agriculture was furthered in the 2014 Farm Bill through actions in the conservation, research, horticulture, and crop insurance titles. Provisions were put in place to expand cost-share

assistance for organic certification, maintain the organic research initiative, and improve organic crop insurance and marketing. Several new provisions were added to improve the enforcement of the USDA’s **National Organic Program** that regulates organic standards and certification. Authorized funding for the program increased to \$15 million annually.

USDA’s Risk Management Agency (RMA) is required to expand organic price elections for producers insuring crops by 2015. Producers choose a percentage of the maximum price set by RMA for their commodity, which is used to determine the value of insurance coverage. The **Organic Agriculture Research and Extension Initiative’s** (OREI) total mandatory funding is set

.. ————— x X x ————— ..
Many of the traditional crops that are so important to the cultural and spiritual lives of Indigenous people are “produce” or “specialty crops” under federal law.

at \$100 million. By most studies, the demand for organic products in the U.S. is going to continue to exceed supply. The 2014 Farm Bill boosted funding for research on the organic sector and organic certification cost-share programs to attract more producers to the organic sector. Organic production is eligible for payments under the EQIP program in the Conservation Title. Other amendments in programs are designed to improve marketing and data collection for organic products.

WHY SHOULD INDIAN COUNTRY CARE?

Horticulture crops are extremely important to tribes for many reasons. First, and most importantly, many of the traditional crops that are so important to the cultural and spiritual lives of Indigenous people are “produce” or “specialty crops” under federal law. Second, there are many

individual and community acts of food sovereignty that are occurring throughout Indian Country. These food sovereignty activities are critical to improving the health and wellness of tribal members. Indian Country health data is among the worst in the country. Chronic diseases, stroke, cancer, heart disease, obesity, and diabetes are at very high rates throughout Indian Country. One of the important ways to address these health issues is to increase the amount of fresh fruits and vegetables available in our communities and to make those foods accessible locally and regionally. Third, as more of these foods are grown and raised in Indian Country, the surpluses are already finding their way into local and regional markets, and many tribes are improving their economic development alternatives by expanding into diverse food production systems. Ensuring that we understand and gain access to the programs authorized in the Horticulture Title is very important and will remain important to tribes for years to come.

EXAMPLES OF OPPORTUNITIES IN THE HORTICULTURE TITLE

In 2013, NCAI provided the following recommendations for changes within the Horticulture Title:

The Horticulture Title contains various provisions designed to support the production of specialty crops – fruits, vegetables, tree nuts, floriculture and ornamental products – in the United States; the support of food safety research in these crops; promotion of farmer’s markets; organic production and marketing standards; and plant disease and protection. Additionally, it aids certified organic agricultural production.

Tribal Perspective:

Although most producers in Indian Country are in the livestock sector, there are a growing number of tribal farms (either government or individual-owned) focusing on the fruit, vegetable and related specialty crop areas. Additionally, the number of farmer’s markets in Indian Country is on the rise. Ensuring that these new- and beginning-farm and diversified farming operations are given a chance to succeed will build rural economic stability and improve the availability of local/regional foods for tribal communities focusing on improving their nutrition and health.³⁹

Additional opportunities in the Horticulture Title include:

Tribal Consultation on Fruit and Vegetable Programs

The USDA agencies primarily responsible for specialty crops must be required to engage in ongoing tribal consultation concerning the impact and growth of the fruit and vegetable sector within Indian Country and the

opportunities and challenges that can be positively impacted by changes in USDA regulations.

Tribal Inclusion in the Specialty Crop Block Grant Program

The Specialty Crop Block Grant Program must be changed to ensure that tribal departments of food and agriculture are eligible for funding under this important program and that tribal projects are not required to go through state funding mechanisms at state departments of agriculture to receive support. There are very few tribal projects that currently receive support and, at the same time, the number of tribal departments of agriculture is likely to continue to grow over time. This program

is critical to the growth of this sector in Indian Country, and tribal sovereignty must be respected by allowing these new departments to receive funding parity.

Honey and Beekeeping

Any reports on honey or beekeeping should include the growth and increase in beekeeping and honey operations in Indian Country.

Tribal Farmer’s Markets

Farmer’s market and local food promotion programs grant funding authorities should require that a minimum of 10 percent of available funding goes to tribal farmer’s markets and local food promotion activities.

Support for Tribal Organic Producers

USDA should launch a special program designed to increase technical assistance to those within Indian Country who are interested and prepared to transition to organic production.

Increased Support for FSMA Outreach

Food safety education initiatives discussed in the Miscellaneous Title, below, should also be

USDA should work with tribal governments and tribal organizations to put in place programs that are designed to protect the integrity of Native food products from fraudulent versions of their foods in the marketplace.

considered within the Specialty Crop Title. The impact of Food Safety Modernization Act of 2011 (FSMA) implementation on tribal producers is different from the impact on any other producer due to the unique land base and tribal production systems in Indian Country. At present, there is not enough funding to adequately reach tribal producers to ensure their knowledge of and compliance with FSMA requirements. USDA should take steps either with U.S. Food and Drug Administration or alone to ensure that tribes are adequately receiving technical assistance on this important new law affecting our food systems.

Protecting Native Foods in the Marketplace

USDA should work with tribal governments and tribal organizations to put in place programs that are designed to protect the integrity of Native food products from fraudulent versions of their foods in the marketplace. This is already occurring, and the federal trust relationship requires that USDA work

with tribal food companies and food producers to ensure that market regulatory mechanisms can be used to augment the ability of tribes to protect their unique food products. This can be done through geographic intellectual property mechanisms put in place by tribal governments to protect unique tribal foods. This should be fully supported and recognized by USDA.

Protect Tribal Seeds and Traditional Foods

USDA should take steps to ensure that tribal seeds are given the maximum protection available under federal law and not allowed to be accessed for commercialized purposes without the consent of tribal governments. Seeds of traditional foods are among the most sacred items to Indigenous peoples and the protection of those seeds, not only as food sources but as important cultural systems, must be required. Tribal governments are entitled to tribal consultation with USDA to determine the best means by which their seeds may be protected.

TITLE XI: CROP INSURANCE

Agricultural risk management is critical for producers. Food production is inherently risky not only from the production standpoint, but also from legal, financial, marketing, labor, and regulatory standpoints. Managing these risks takes a lifetime of attention, focus, dedication, and assistance. For decades, Congress approached risk management in agriculture production through a few federally authorized programs, but primarily utilized targeted bills passed when disasters struck. After years of differing levels of engagement, Congress began moving toward a private sector-focused insurance risk management program and away from disaster-driven approaches to assisting producers.

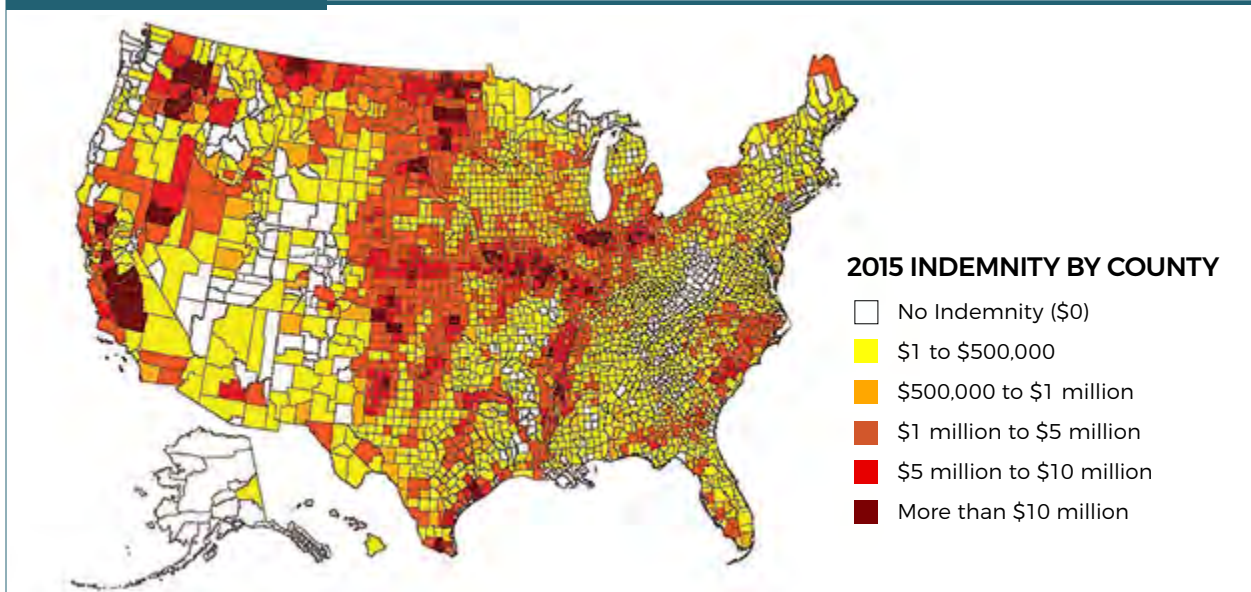

The Agricultural Risk Protection Act of 2000 established the Federal Crop Insurance Corporation (FCIC) Board. The Risk Management Agency (RMA) is the primary agency within USDA that oversees the Department’s risk management programs. The FCIC board manages the risk product portfolio and provides guidance under the general supervision of the Secretary of Agriculture. The board is responsible for maintaining and creating new programs for risk management and risk mitigation in agriculture. The board delegates the broad authorities to approve new risk insurance policies, new insurance plans, and insurance plan modifications to the RMA Administrator. At

present, the board consists of the Under Secretary of USDA Farm and Foreign Agriculture Service, the USDA Chief Economist, the FCIC Manager (RMA Administrator), four farmers, an individual involved in insurance, and an individual knowledgeable of reinsurance and regulation of insurance.

The FCIC Board conducts research and studies concerning the actuarial soundness of an insurance policy before offering it. Insurance policies offered are normally piloted in regions or with certain crops before being released for purchase by producers. Insurance for crop and livestock risks continues to grow in acceptance, and there are now more than 100 insurance products in the program. Every subsequent Farm Bill has continued to increase the scope and range of the program. While there are still many improvements to be accomplished, the ability of producers to at least consider the coverage of their crops and livestock under applicable programs is an important option that can in many cases mean the difference between staying in business or leaving farming and ranching.

The **Standard Reinsurance Agreement** and the **Livestock Price Reinsurance Agreement** establish the terms under which FCIC provides reinsurance and subsidies on eligible crop insurance contracts sold by an insurance company. An

2015 RMA CROPS INDEMNITIES: As of January 19, 2016

Source: USDA Risk Management Agency

insurance company must enter into the standard agreements to be approved for writing insurance policies adopted for use by RMA/FCIC. By regulation, an insurance company must be in good financial standing and in compliance with the state laws where domiciled and writing business prior to being considered for approval of a Standard Reinsurance Agreement (SRA) or Livestock Price Reinsurance Agreement (LPRA).

In addition to the approval of policies and general management of the FCIC functions, RMA also conducts education and training of producers regarding the key areas of risk, how to best manage such risk, and the specifics of offered policies. These educational and training opportunities are provided through competitive educational grants and through a relationship with USDA NIFA that manages an **Extension Risk Management Education Program** delivered through four regional centers and a national center. These centers also provide education and training for producers through competitive grants offered to eligible entities who in turn meet with producers or plan and provide educational offerings.

Producers are served by a system of regional offices. Producers can search online⁴⁰ for crop insurance agents approved to offer crop, livestock or both types of insurance policies. Producers can also search⁴¹ for approved insurance providers who have entered into reinsurance agreements with RMA.

Special attention in the bill is paid to the growing **organic production sector** and to the needs of beginning farmers and ranchers, who often are unfamiliar with the complexities of crop insurance or management of risk on their new farm or ranch. RMA provides coverage for certified organic acreage and transitional acreage (acreage transitioning to certified organic acreage in accordance with an organic plan). As the organic sector continues to

grow, the coverage of organic production systems will likely continue to grow and improve as well. Beginning farmers and ranchers received assistance in the 2014 Farm Bill through efforts to make purchasing crop insurance more affordable. The bill exempted beginning farmers from paying administrative fees for crop insurance policies and allowed them to use the production history of previous farming operations in the decision making or physical activities. The bill increases the premium subsidy rates for beginning farmers by 10 percent during their first five years of farming. All these efforts make it easier for beginning farmers to access

insurance coverage which they might otherwise avoid purchasing due to the fragile nature of their operations in the first critical years.

Considerable attention is paid by RMA and other agencies of USDA to the compliance of producers with conservation-focused requirements. Producers must comply with **highly erodible land and**

wetland conservation requirements if they are to receive insurance premium assistance for crop insurance. Most likely, these producers are already required to comply with these critical conservation requirements if they are participating in FSA (farm lending) or NRCS (conservation) programs. The 2014 Farm Bill “re-linked” conservation compliance with the insurance premium subsidy. Conservation compliance requires producers to have a conservation plan if they plant annually tilled crops on highly erodible soil and prohibits producers from planting on or destroying wetlands for crop production. Producers who do not comply with conservation compliance can still purchase crop insurance, but they are ineligible to receive the premium subsidy paid by the federal government. Producers eligible for commodity, conservation, or disaster programs under FSA or NRCS will remain eligible for the government-paid crop insurance premium subsidy.

.. _____ x ^ x _____ ..
Crop insurance is an important tool of risk management and the products in place now must be examined to ensure they are suitable for tribal food production systems.

The crop insurance benefits of producers who till **native sod** in Iowa, Minnesota, Montana, Nebraska, North Dakota, and South Dakota may be impacted. Crop insurance benefits are reduced on native sod acreage tilled for production of annual crop and remain reduced until the native sod acreage has been planted for four crop years.

RMA was directed in the 2014 Farm Bill to develop new insurance products for underserved commodities and to address the ongoing issue of producers suffering a loss of insurable coverage when they experience lower yields following disasters. The 2014 Farm Bill provided some flexibility to producers when seeking coverage for these types of losses. Additionally, producers may do price elections for organic crops produced in compliance with the USDA National Organics Program that reflect actual retail or wholesale prices received by the organic producer. Research and development of new products for bioenergy crops, catfish, alfalfa, livestock diseases and business interruptions, whole-farm diversified operations, and food safety for specialty crops were also authorized. The **Noninsured Crop Assistance Program** (NAP), which provides weather-related loss coverage for commodities that lack available crop insurance, was expanded.

RMA was also authorized to include coverage for the value of on-farm activities necessary to make crops ready for market. The Manager's statement to the Farm Bill specified that this provision is meant to include post-production incidental processing activities that occur soon after harvest, including packing, packaging, washing, sorting, and other activities that are essential to marketable crop production. This provision will likely lead to better crop insurance products for specialty crop producers. The Whole Farm Revenue Risk Management product authorized for diversified farms will also likely be helpful to diversified farms if the complexities of such product can be simplified.

WHY SHOULD INDIAN COUNTRY CARE?

Decades ago it could correctly be said that few options existed for most producers in terms of insurance coverage of risks associated with agricultural production, and most producers sought relief from Congress when disasters occurred. Crop insurance is an important tool of risk management and the products in place now must be examined to ensure they are suitable for tribal food production systems.

Additionally, one of the four appointed farmer/rancher members of the FCIC governing board is Maggie Goode, a third-generation cattle rancher on the Flathead Reservation in Montana. She is employed by the Confederated Salish & Kootenai Tribes and has received the USDA Farm Service Producer of the Year award and the USDA Farm Services Volunteer of the Year award. She also serves on the board of directors for Eagle Bank, a tribally owned bank, and is a former representative of her Tribal Council. Maggie is the first Native appointed to the FCIC Board of Directors and was originally appointed in 2010. Supporting her and any subsequent tribal producers appointed to that board is important.

EXAMPLES OF OPPORTUNITIES IN THE CROP INSURANCE TITLE

In 2013, NCAI made the following recommendation regarding the Crop Insurance Title:

This title provides for federal crop insurance and disaster assistance, including policies for crop insurance coverage and risk management.

Tribal perspective:

Tribally owned farms and ranches are significant users of crop insurance products as important tools to support business investments. Ensuring that continued attention is paid to the array of crop insurance products offered is important. And making

sure that tribal-specific disaster and insurance needs are being met is critical. Reauthorization of prior programs and ensuring the continued health of current insurance programs is important to Indian Country agriculture, particularly as climate change and year-to-year weather impacts to these industries continue. A strong safety net in times of trouble is essential to a strong agriculture sector. Continuing to improve the number of types of insurance products all those within the agriculture sector can use to insure their crops, livestock, and business operations is important. Farming and ranching is inherently risky and without attention to crop insurance and disaster programs, a successful business enterprise can be lost in one season.⁴²

Additional opportunities in the Crop Insurance Title include:

RMA Study on Crop Insurance in Indian Country

RMA should conduct a study to ensure that the current range of crop insurance products does not inadvertently adversely affect tribal food production. If that study reveals that either the specific crop insurance products or the general guidance documents of RMA do not adequately consider tribal production issues, a separate administrative guidance or notice should be issued by RMA to ensure that such impediments are cured. Tribal livestock producers should be afforded the same opportunity to pay premiums upon the sale of the livestock instead of making an upfront payment.

Development of Crop Insurance for Traditional Foods and Livestock

RMA should encourage the development of a unique crop insurance policy designed to cover

the production systems associated with tribal traditional food and livestock. The production systems associated with such products should be recognized as Good Agricultural Practices (GAPs), and tribal producers should also be afforded the same opportunity to pay premiums upon the sale of the crop or livestock instead of making an upfront payment.

Tribal Producer Education Programs

RMA should ensure that at least 10 percent of all projects funded through its Risk Management Education Program are focused on tribal producer risk management training needs.

Allow Tribal Insurance Companies to Insure Tribal Producers

RMA should also begin immediately reaching out to the AMERIND Risk, a 100 percent tribally owned and operated insurance provider, because of its significant experience in offering and underwriting insurance needs in Indian Country. AMERIND Risk should be engaged to begin the process of offering crop insurance products in Indian Country because it serves a national intertribal audience. The current crop insurance research, product development, and policy sales areas are not developed for, but do not adequately reach, smaller tribal producers.

Appoint Tribal Producer to FCIC Board

USDA should consider appointing tribal producers to fill future vacancies on the FCIC Board.

TITLE XII: MISCELLANEOUS

While seemingly functioning as a “catch-all” for topics not covered in other titles of the Farm Bill, the Miscellaneous Title contains many important programs. In addition, the section can also contain program authority or create broad policy or management changes with sweeping impacts across the programs and authorities discussed in other titles or across the multiple mission areas, agencies, and offices of USDA.

The 2014 Farm Bill made some important changes that resonate throughout USDA’s programs and authorities. One such change was the establishment of the **Office of Tribal Relations within the Office of the Secretary**. Prior to the establishment of this office as a permanent part of the Office of the Secretary, the functions assigned to this important office either were not addressed at all, were addressed by uncoordinated activities, or “floated” among various offices and agencies. The creation of this office as a permanent component of the Office of the Secretary elevates the role of tribal consultation and the government-to-government relationship between tribal governments and the federal government. This relationship is founded in the trust responsibilities owed tribes through treaty and federal law, and locating the office at this level of responsibility within USDA creates much greater opportunities for consistency and effectiveness in how USDA delivers programs and services to tribal governments, tribal communities, and tribal producers.

The bill continues to authorize **Outreach and Assistance for Socially Disadvantaged Farmers and Ranchers**, and adds **Veteran Farmers and Ranchers** as an important focus for USDA moving forward. The term “veteran farmers and ranchers” has been included throughout the Farm Bill to increase participation by veterans in Farm Bill programs. The definition of the term is: *a farmer or rancher who has served in the armed forces, and has either never operated a farm/ranch or has done so for 10 years or less*. A high percentage of the nation’s active military and deployed reserve forces come from rural areas and many have grown up

on or around farms and ranches. Their return to communities to either resume a possible career in food production or to begin a career post active duty will be greatly advanced by their inclusion in USDA programs. This title of the Farm Bill also creates a **Military Veterans Ag Liaison position**, which is very important to Indian Country because of the high number of military veterans returning to our communities and their traditional and continuing ties to our farming and ranching enterprises.

The bill also establishes a Socially Disadvantaged Farmers and Ranchers Policy Research Center charged with developing policy recommendations for protecting and promoting the interests of socially disadvantaged farmers and ranchers. The **Outreach and Assistance for Socially Disadvantaged Farmers and Ranchers Program** (also known as the Section 2501 program), which has been in place since the 1990s and is focused on historically underserved farmers, was continued in the 2014 Farm Bill. The 2014 provisions provide only \$10 million annually to support the program (down from approximately double that amount in previous Farm Bills).

The Farm Bill requires that USDA provide a **receipt for service** when an individual applies for a loan, applies to participate in a USDA program, or applies for other USDA benefits. This requirement will ensure that in the future, both USDA and individuals applying for benefits at USDA will have a record of such transactions.

The bill also establishes a **Sheep Production and Marketing Program** within the Agricultural Marketing Service. The competitive grant program strengthens the production and marketing of sheep products through improved infrastructure, business and resource development. **Country of Origin Labeling** (COOL) has been — and continues to be — a major issue facing the livestock industry. The Farm Bill directs the Secretary to conduct an economic analysis of the COOL since its implementation. The bill also adds venison to the list of products covered by the statute. However, the bill does not make any

changes to the statute or more recent USDA rules regarding the labeling of meat products.

To increase participation by limited-resource, beginning, and socially disadvantaged farmers, the premium for the **Noninsured Crop Assistance Program** (NAP) was reduced for individuals in such groups by 50 percent.

The Farm Bill also responds to some of the concerns agriculture producers have raised related to the U.S. Food and Drug Administration's (FDA) proposed rules to implement the **Food Safety Modernization Act**. The 2014 Farm Bill requires that when publishing the final produce rule, FDA must include **scientific and economic analyses of the impacts** the final rule will have on agriculture, as well as a plan for evaluating and responding to the impact of the final rule once it becomes effective.

The Farm Bill also amends the Clean Water Act to exempt certain silviculture activities from the National Pollutant Discharge Elimination System (NPDES) permit requirements. *Specifically, an NPDES permit will not be required for discharge*

from runoff from the following activities: nursery operations, site preparation, reforestation and subsequent cultural treatment, thinning, prescribed burning, pest and fire control, harvesting operations surface drainage, or road construction and maintenance. The bill also contains a provision authorizing grants to state and tribal governments and research institutions to promote the **domestic maple sugar industry**.

Finally, the National Drought Council that was in the U.S. House of Representative's version of the 2014 Farm Bill was not included in the final bill. However, the Farm Bill conference committee included report language directing the Secretary to work closely with state and tribal stakeholders as the Department implements the **National Drought Resilience Partnership** established by the Secretary. This provision is very important to tribes because many tribes have suffered through continued droughts. Having a tribal voice on the National Drought Resilience Partnership is very important.

For several decades, there has been increasing interest and focus on **local food, healthy food**

access, sustainability, and organic agriculture investments and increasing funding for rural development. The 2014 Farm Bill authorized more than \$500 million from 2014-2018 in the areas of local food, rural development, organic agriculture, and healthy food access initiatives – a nearly 50 percent increase over the previous funding levels. Funding for these types of programs are scattered throughout the Farm Bill in various titles. Examples include: farmer’s market and local food promotion (\$150 million over five years); specialty crop block grant program (\$100 million over five years); value-added producer grant program (\$63 million over five years); rural microentrepreneur assistance (\$15 million over five years); food insecurity incentive program (\$100 million over five years); and community food projects (increased to \$9 million a year from \$5 million).

The 2014 bill restored the **Organic Production and Market Data Initiatives** which develops data about the organic sector to improve decision making. In addition, the bill directs USDA agencies to utilize the data to coordinate with policy makers and enable the RMA (crop insurance) agency to develop better policies of crop insurance for organic producers. In addition to gathering information on the organic sector, the bill instructed the creation of data initiatives to increase information for local and regional food markets. A local food production and program evaluation provision in the law directs USDA to collect data on the production and marketing of local or regionally produced agriculture products, monitor the effectiveness of programs serving this sector, and identify barriers to local and regional market access due to regulations aimed at small scale producers. The bill invests \$444 million in beginning, veteran, and socially disadvantaged farmer initiatives over 10 years – a more than 150 percent increase in funding over previous farm bills.

The Miscellaneous Title also created many **pilot programs** in various titles of the Farm Bill. One pilot or demonstration project focused on using SNAP benefits in online transactions. Another required USDA to implement a pilot program

to allow states to operate EBT retailer fraud investigation programs. The Secretary is required to study the ability of the **Northern Mariana Islands** to administer SNAP directly. Another \$200 million pilot program was focused on studying programs in 10 states that would engage able-bodied parents in TANF-type work and job training as part of receiving SNAP benefits. An additional \$5 million in funding was directed toward providing more fresh fruits and vegetables in the schools. Up to \$10 million in FSA microloans were to be made available to CDFIs through a pilot project, and up to \$10 million was authorized for the Rural Gigabit Network Pilot Program to provide very fast Internet service to underserved areas. The Forest Service Large Airtanker and Aerial Asset Firefighting Recapitalization pilot program was also created to address the needs for air tankers in fire-fighting functions. An index-based weather insurance pilot program with subsidized premiums was created, and a local/regional food aid program that provides food aid overseas was created to study the savings that would be realized if purchase and delivery of local food in food aid programs occurred.

Local and regional foods received additional focus in the Nutrition, Credit, Rural Development and Horticulture Titles. The bill provided for increased consumer access to local and regionally produced food, increased marketing, increased farmer direct-to-consumer sales and intermediary outlets (farm-to-institution, local retailers, food hubs, restaurants, etc.). The bill expanded the funding and scope of farmer’s market and local food promotion programs and required the USDA to develop crop valuation methods that serve local and regional food producers in better ways. A new program was created to provide grants to organizations that encourage fruit and vegetable consumption by SNAP recipients by increasing their purchasing power. It includes a preference for promoting local food and direct-to-consumer sales locations. The farmer’s market promotion program was expanded to support projects that include intermediaries (e.g., food hubs), and mandatory funding for the program was increased.

SNAP-authorized retailers and benefit redemption locations in Nutrition Title included farmer's markets and other direct-to-consumer marketing outlets. These locations are not required to pay all of the electronic benefit transfer equipment and implementation costs. SNAP benefits can also be used in Community Supported Agriculture business models. USDA was also allowed to carry out a pilot project that gives farm-to-school programs the flexibility to purchase fresh fruits and vegetables from multiple suppliers and specify a geographic preference in procurement. The Healthy Food Financing Initiative in the nutrition title authorizes the USDA to work with CDFIs to manage funds with the goal of supporting retail food projects in low-income communities that would expand or preserve food access and accept SNAP benefits. Local and regional food systems can be prioritized in these projects. Local and regional production of fruit and vegetables is supported through multistate projects authorized in the specialty crop block grant programs of the Horticulture Title. The value-added producer grant program can also target to small and mid-sized farms, socially disadvantaged farmers, veterans, and local and regional food supply networks.

Beginning farmers and ranchers are supported in multiple titles as well. The conservation, credit, rural development, research, crop insurance and miscellaneous titles all contained provisions in the 2014 Farm Bill that continued to provide focus and support to the importance of beginning farmers and ranchers. Support is provided through: (1) increased funding for beginning farmer and rancher development through technical assistance and education (\$100 million); (2) farmland transition assistance; (3) improved outreach, allowing the transfer of conservation lands to beginning farmers and ranchers by assisting retired or retiring farmers in transitioning their lands (\$33 million); and (4)

changing the definition for farm ownership direct loans from FSA to allow for more producers to be considered as beginning (by adjusting the acreage limit within the definition of "qualified beginning farmer or rancher"). The term "beginning farmer or rancher" was also added to crop insurance programs, improving their ability to access crop insurance by providing a 10 percent reduction

in insurance premiums and exempting them from paying the \$300 administrative fee for catastrophic level policies. The act also enhances the provision of catastrophic-level risk protection for beginning farmers who are producers of commodities that do not have insurance products available (e.g., specialty crop producers and producers in diversified

operations on smaller acreages). Premiums on buy-up level coverage were reduced by 50 percent for beginning farmers, who can also have their application fee waived. Title II also allows a 25 percent payment reduction for beginning farmers in managed haying and grazing programs on the Conservation Reserve Program lands.

The **Beginning Farmer and Rancher Development Account Pilot Program** was extended through 2018. Additionally, the USDA FSA microloan program for beginning farmers and ranchers was made permanent, and loans to these producers and veteran farmers are exempt from term limits that would otherwise apply on direct operating loans. (Term limits refer to the limitations on how long individuals can receive farm loans from FSA before they must graduate to private credit.) The act increases the maximum conservation loan guarantee amount from 75 percent to 90 percent of the total loan amount for beginning farmers or ranchers. Maximum loan amounts for beginning farmers and ranchers seeking to purchase real property are increased to \$300,000. Beginning farmers and ranchers are prioritized for value-added producer grants.

.. ————— x ^ x ————— ..
*The value-added
producer grant program
can also target small
and mid-sized farms,
socially disadvantaged
farmers, veterans, and
local and regional food
supply networks.*

According to the USDA Economic Research Service, beginning farmers accounted for nearly 11 percent of all land in U.S. farms in 2011, but for only 7 percent of acres enrolled in crop insurance. The new premium assistance provisions of the Crop Insurance Title should be able to improve the use of crop insurance among these farmers. In 2012, FSA made 13,384 direct loans to beginning farmers for a total of \$1.1 billion and guaranteed another 2,659 loans to beginning farmers for a total of \$639 million. The two programs combined made 50 percent of their loans and 42 percent of their loan obligations in 2011 to beginning farmers. In 2013, the national average farm size was 418 acres, while the median acreage was only 80 acres. In some states, the FSA portfolio to tribal producers who meet the definition of “new or beginning” reaches as high as 80 percent of their overall lending portfolio.

Veteran farmers and ranchers were impacted by provisions in the conservation, credit, rural development, research, and miscellaneous titles. Microloans for veterans were exempted from term limits applied to other USDA direct loans. The Transition Incentive Program also allowed land coming out of CRP programs to be eligible for additional payments if the landowners lease or sell the land to a veteran farmer. USDA is required to set aside a portion of the EQIP program and the CSP program for beginning and disadvantaged farmers, and the 2014 Farm Bill requires that preference be given to veteran farmers and ranchers. They are also given preference in the value-added producer grant program. As USDA establishes the Military Veterans Agricultural Liaison Program, they must ensure that veteran farmers and ranchers are provided information concerning training programs. The Liaison may enter agreements with service providers to promote research, educational materials development, workshops, vocational training, mentorships, and internships. In addition, the BFRDP program is required to make veteran farmers and ranchers a priority for agricultural rehabilitation and vocational development programs and training, and the program is required to set aside a minimum of 5

percent of funding to veteran programs. Veterans are defined as those who served in the U.S. Army, Navy, Marine Corps, Air Force, or Coast Guard, including the reserve units and who were discharged or released other than in a dishonorable status and who have: (1) not previously operated a farm or ranch or (2) operated a farm or ranch for not more than 10 years. The Outreach and Assistance for Socially Disadvantaged Farmers and Ranchers Program was expanded to include veterans.

WHY SHOULD INDIAN COUNTRY CARE?

The issues covered within the Miscellaneous Title cover a wide variety of areas ranging from veterans’ services to specific grant-making programs, to authorities related to the Office of the Secretary. There are many areas of the Miscellaneous Title that touch on issues that impact tribal communities and also support specific programs used by tribes. This overarching title of the Farm Bill can be used to coordinate work across all titles and create new programs and authorities that can be either piloted or implemented. This title is the avenue to address issues that do not fit neatly in other titles.

EXAMPLES OF OPPORTUNITIES IN THE MISCELLANEOUS TITLE

There has been a vast amount of discussion of the legalization of hemp production in Indian Country. The legalization of **hemp production** for industrial purposes is strongly supported throughout tribal leadership and the agriculture sector. Hemp production would significantly improve the economic situation of tribal communities, many of whom have very few other viable options for economic development. Investment in the production, harvesting, storage, distribution, and ultimate commercialization of hemp for industrial purposes would likely do more to raise boats in Indian Country than any other production system. Clearly the production of healthy foods — fruits and vegetables — should be increased and

produced by or made easily accessible for tribes, but we also need strong production of commodities that will allow us to build communities. Industrial hemp offers that opportunity.

Specific NCAI recommendations found in its FY 2018 document include:

Office of Tribal Relations: Fund the USDA's Office of Tribal Relations at a minimum of \$1.5 million.

The Office of Tribal Relations (OTR), located within the Office of the Secretary, is a critical voice for agriculture in Indian Country within the USDA, especially since a clear majority of USDA's services and programs affect and touch tribal lands and communities. Many times, when decisions are being made, there is a need to open lines of communication between the agency and within Indian Country. OTR serves a linchpin role in expanding all USDA program support throughout Indian Country, as well as ensuring that relevant programs and policies are efficient, easy to understand, accessible, and developed in consultation with the American Indians and Alaskan Native constituents they impact. The OTR is also responsible for coordinating policies affecting American Indians and Alaska Natives across other federal agencies and throughout the USDA.

Since its inception, OTR has increased its responsibilities in four major areas:

- *Under the *Keepseagle v. Vilsack* settlement, OTR coordinates all USDA responsibilities for Technical Assistance in 10-15 regional locations over the course of the five-year settlement period and is the Designated Federal Official for the Council for Native American Farming and Ranching.*
- *Pursuant to Memorandums of Understanding (MOUs) between the USDA and the Bureau of Indian Affairs, OTR is critical to the development of inter-agency strategic plans involving data sharing, land consolidation, and credit deployment.*
- *OTR is the lead for implementation of the intra- and inter-agency implementation of the USDA's 2012 Sacred Sites Report and corresponding*

MOUs between USDA and the US Departments of the Interior, Energy, and Defense, as well as the Advisory Council on Historic Preservation.

- *OTR supports USDA Rural Development (RD) and Rural Utility Service on implementation and administration of the 2012 Substantially Underserved Trust Areas initiative under section 306F of the Rural Electrification Act of 1936, as amended (7 U.S.C. 906f). This initiative will allow RD to provide greater flexibility and more favorable loan terms around much-needed electricity, water and waste disposal, telecommunications, distance learning and broadband infrastructure in trust areas.*

The OTR's initial funding level of \$1 million in FY 2010 was slashed in FY 2011 and FY 2012 and continues to remain around \$500,000 in FY 2017. This leaves OTR with insufficient personnel and resources to support its vast mission within the Department, in partnership with other federal departments, and throughout the many Native communities in the United States. With the added responsibilities for OTR initiated in 2012, it is clear that OTR requires additional resources to function in accordance with US law and policy.

Lack of sufficient funding presents a barrier to OTR expanding their work to provide the programs, technical assistance, content or even the basic communications to ensure that non-Internet education and training are available to tribes for all USDA programs. Active tribal participation in USDA funding opportunities is required to assist the build-out of broadband infrastructure, and support the workforce development required to fully utilize Internet capabilities, business programs, and financing necessary to bring Native goods and services to market.⁴³

NCAI's themes and strategies also include focusing more broadly on economic development, infrastructure development, holistic development, and using Native resources to improve the lives of Native people while protecting federal resources available to tribes. By investing in our communities, we can lessen crime, improve health and education,

and build strong tribal economies. Being able to rely on federal investments while also ensuring that access to private investment is not stymied are achievable goals. NCAI also supports investments in communities that will result in decreased crime rates and land-based investments.

Other types of programs and assistance not covered in other bill titles, including provisions to assist limited-resource and socially disadvantaged farmers, and agricultural security, among others. This title has many provisions designed to ensure that the voices of minority producers and socially disadvantaged producers continue to be heard by the Department.

Tribal Perspective:

Indian Country believes that the provisions in the Miscellaneous Title need continued analysis and improvement. Ensuring that the National Appeals Division process for appealing administrative decisions, particularly in the years that will follow settlement of the outstanding civil rights complaints of past decades, is fair and easy to engage with is important to ensuring improvements and fairness are engrained within the Department's processes.

The Minority Advisory Committee is important, but this Farm Bill should make permanent the Native American Farmers and Ranchers Advisory Committee to the Secretary, which was agreed to in the Keepseagle settlement. Ensuring that the Secretary continues to hear directly from Indian Country on matters related to strengthening farming and ranching is critical, because the land tenure and regulatory processes that are unique to farming and ranching on trust lands and within reservation communities are not shared with any other group of individuals. Indian Country is equally concerned with improving our biosecurity preparedness through cooperative agreements and partnerships with USDA. Our lands are among the most remote in the United States and as such we are among the most susceptible to terroristic impacts.

Finally, further efforts should be made to ensure that the improvements incorporated within the Keepseagle settlement programmatic relief are made

a permanent part of USDA's operating practices moving forward, including the analysis of placement of shared BIA/USDA offices on reservations, which would be particularly important now when so much attention is being paid to streamlining programs, adjusting to retirements and sequestrations, and the attendant concerns regarding impacts on actual program delivery moving forward. Other types of programs and assistance not covered in other bill titles, including provisions to assist limited-resource and socially disadvantaged farmers, and agricultural security, among others.

1. 638 Contract Authority

At present, no funding authority/program within the USDA allows 638 contract authorities. If Congress would permit/authorize as a demonstration project a 638-contract authority within each agency of the Department, USDA could "attack" the subject of working through how it might implement 638 authorities in a comprehensive way across the entire Department.

2. [NEW] Indian Agriculture Development Trust Fund⁴⁴

Recommended Provisions

Proposed Legislative Text: An Act to support agriculture economy on Indian Reservations and other purposes

Section. 101. Short Title.

Section. 102. Findings.

Section. 103. Definitions.

Section. 104. Establishment of Midwest Watershed Agriculture Development Trust Fund.

Section. 105. Indian Agriculture Development Grants.

Section. 101. Short Title.

This Act shall be cited as the "Midwest Watershed Agriculture Trust Fund Development Act."

Section. 102. Findings

Congress finds that –

a. The highest unemployment rates in the country are on American Indian Reservations with some rural tribes having a chronic unemployment rate as high as 80%.

b. This economic failure leads to a comprehensive

social breakdown that affects health care, education, crime and public safety, and the entire quality of life for Indian peoples living on those reservations.

c. Production agriculture has the potential to provide a private sector economy for rural Indian tribes.

d. Tribes have not benefitted from a secure, stable source of technical assistance and expertise in the development of their agriculture-related economies, and as such would benefit from same.

e. Several statutes have been enacted that establish Infrastructure Development Trust funds for individual tribes.

f. Existing Trust funds have been successfully financed by revenue from the Western Area Power Administration.

Section. 103. Definitions

a. The term “Secretary” means the Secretary of Agriculture.

b. The term “Indian Tribes” or “Tribes” means those Indian Tribes so recognized by the Department of the Interior.

c. The term “Department” means the United States Department of Agriculture.

d. “Extension Services” means those education and extension of research knowledge services commonly delivered through the Cooperative Extension federal programming formula funds in each state. For purposes of this Act, “Extension Services” shall

mean the provision of education and extension of knowledge in the subject areas of farm financial and related business planning services; marketing planning services; legal education services; production management services (crop, livestock, alternative crops, etc.); and youth development services (FFA, 4-H, and other tribal-government sanctioned youth development and engagement, including leadership program services focusing on agriculture and natural resource engagement, food and nutrition, and food-related entrepreneurship development).

e. “USDA” means the United States Department of Agriculture

f. “Secretary” means the Secretary of the United States Department of Agriculture

Section. 104. Establishment of an Indian Agriculture Development Trust Fund

(a) There is hereby established in the Treasury of the United States a fund to be known as the “Indian Agriculture Development Trust Fund” (herein after the “Fund”).

(b) Beginning with fiscal year 2013, and for each fiscal year thereafter, until such time at the aggregate of the amounts deposited in the Fund is equal to \$1,000,000,000, the Secretary of the Treasury shall deposit 25% of the receipts from the deposits to the Treasury of the United States for the preceding year from the Western Area Power Administration into the

Fund. The Secretary of the Treasury shall invest the amounts deposited in the Fund only in interest-bearing obligations of the United States or in obligations guaranteed by the United States.

(c) The Secretary of the Treasury shall annually transfer to the Secretary of Agriculture the interest that accrues on the Fund to be used as grants to Indian Tribes to improve the infrastructure of farming Tribes, increase farm production, expand value-added agriculture businesses, and expand extension services.

Section. 105. Indian Agriculture Development Grants

a. The Secretary shall use the funds transferred from the Secretary of the Treasury for grants or loans (including micro-loans and loan/grant combinations) to Indian Tribes to improve irrigation, roads and transportation services, broadband services, public buildings, other essential services that support agriculture and natural resource development to benefit tribes.

b. The Secretary may provide grants to land grants universities in States with a high Indian population and significant Indian lands base for providing specialized agriculture-related extension services on Indian reservations. The Secretary shall establish the requirements for receiving said funds and shall regularly consult with tribal governments in delivering this program. The program shall be supported through the Office of Tribal Relations in the Office of the Secretary, which is hereby granted all necessary authorities to carry out the purposes of this act. The Office of Tribal Relations may receive input and support from the National Institute for Food and Agriculture and other agencies of USDA in carrying out its responsibilities on behalf of the Secretary.

c. The Secretary may also designate one university in the Missouri River Valley as the lead university for developing and coordinating Indian agriculture-related extension services throughout the United States and provide a grant for such purposes to said institution to perform coordination and collaboration roles between partner institutions and the Tribes they serve.

3. Authorize the establishment of an Office of Tribal Agriculture.

Proposed Provision

(a) In general. The Secretary shall establish an

Office of Tribal Agriculture within the office of the Secretary to coordinate all USDA programs as those programs apply to Indian Tribes; maximize the value of programs for Indian Tribes and to serve as a liaison between the Department and Indian Tribes. Among other responsibilities, the Office of Tribal Agriculture shall report to the House Committee on Agriculture and the Senate Committee on Agriculture, Nutrition, and Forestry not less than once each fiscal year on the activities of the Department in furtherance of the activities set forth in this section.

(b) Authorization of Appropriations. For the Office of Tribal Agriculture, there are hereby authorized to be appropriated not more than \$2,000,000 for 2014 and each subsequent fiscal year, to conduct activities related to supporting the Department in meeting its goals concerning tribal programs, including the establishment of cooperative agreements for the provision of technical assistance and outreach and education programming, the conduct of grant programs, and the establishment of office staff to accomplish the goals set forth in this section.⁴⁵

Tax Provisions

This title creates the Agricultural Disaster Relief Trust Fund to fund Supplemental Agricultural Disaster Assistance. It also introduces numerous tax provisions affecting customs fees, conservation and commodity program payments, timber investment, biofuel production, and agricultural income.

Tribal Perspective

All successful food and agriculture businesses are knowledgeable of and incorporate knowledge of tax provisions into their business plans and their plans to transition business operations to the next generation. Many tax advantages exist to those in the agriculture and energy sector. Ensuring Indian Country fully accesses all relevant tax advantages to their food, agriculture and energy businesses is critical to long-term success. Tax issues will be a looming topic this coming year as Congress positions itself for significant tax reform. In this process, Indian tribes want to ensure they are not left out of discussions on how best to simplify the Internal Revenue Code. While NCAI realizes that any tax components fall within the jurisdiction of the Senate Committee on Finance,

we have included some tax-related suggestions below which our membership would like included within the Farm Bill.

1. Tax Extenders

Currently, agriculture is increasingly dependent on financing and development tools. As such, NCAI supports the extensions of both the Indian Employment Tax Credit (26 U.S.C. § 45A) and the Accelerated Depreciation tax incentive for business property located on Indian reservations (26 U.S.C. § 168). Both tax incentives expired at the end of 2012, however many businesses operating on the reservation rely on these tax credits to help subsidize the cost of materials and workers. While we would like to see these extended, we also feel the accelerated depreciation and Indian employment tax credits are inconsistent because they continue to be renewed year after year instead of being made permanent, or renewed for a longer duration (4-7 years). This uncertainty makes them unreliable as investment incentives to attract the multi-year large-scale projects they were intended to attract. And while we acknowledge the unfavorable budget climate, we note that making these incentives permanent does not increase costs on an annual basis, and would attract new businesses into Indian country instead of only benefitting those non-Indian businesses already operating on the reservation. NCAI supports these provisions but wants to remind lawmakers that something more is needed to spur business development in Indian Country, particularly in energy development.

2. Tax Credits for Buying Indian Food and Agriculture products

NCAI also recommends adding language that would create a new “Buy Indian” avenue that would encourage consumers and those within the food supply chain to buy American Indian and Alaska Native food products. Such incentives will assist in improving the attention drawn to the growing range of Native food products in the supply chain and provide incentive for those distributors, retailers, and related food purchasers to examine Native food product purchases to meet their food supply needs.⁴⁶

Livestock

This (sub)title enhances electronic mandatory livestock reporting. It adds and redefines commodities covered by country-of-origin labeling. The (sub)title allows some interstate sales of state-inspected meat and poultry, establishes voluntary catfish grading and inspection, and amends rules for hog and poultry production contracts. It addresses livestock disease prevention and food safety concerns, increases funding for National Sheep Industry Improvement Center, and requires manure uses study.

Tribal Perspective:

Most producers in Indian Country, according to most recent Agricultural Census data, are in the livestock sector. This title ensures that livestock marketing is fair and transparent; that livestock disease is followed and prevented; and that country of origin labeling of livestock products is adequately addressed.

AMERICAN INDIAN FARMS AND RANCHES Income Statement Sheet		
	2007	2012
Market value of products sold	\$3.2 billion	\$3.2 billion
Government payments received	\$90 million	\$90 million
Total production expenses	\$2.9 billion	\$2.9 billion
Net cash farm income	\$513 million	\$371 million
Average net cash income per farm	\$8,351	\$6,632

Source: U.S. Department of Agriculture National Agriculture Statistics Service

Indian Country livestock operations benefit when the livestock markets are strong and livestock disease is carefully monitored. Ensuring production contracts are fair and that producers have a means to report and have investigated violations of federal law is important to the market health for Indian livestock production.⁴⁷

Veteran's services are critical to Indian Country because Native people serve in the military at higher rates than any other segment of the population. Native veterans are also key to many of the most successful and longest-running farms and ranches in Indian Country. We also know that our younger veterans need support and encouragement to find their careers and life's work after they return home. We need them to lead many of our farms and ranches into the future.

If USDA is given the authority to conduct a pilot program to examine the ability of the Mariana Islands to manage SNAP, then other tribes throughout the country should also be able to manage SNAP and other feeding programs. A USDA report examining the feasibility of tribes managing feeding programs discussed in Nutrition Title section, identifies key concerns that can be addressed by future Congressional action. The next Farm Bill should take steps to implement the key components identified in that study that would open the door for tribal governments to manage those important programs. By including 638 authority and passing key provisions that would support tribal program management of feeding programs, additional steps could be taken throughout the USDA to pilot (in future Farm Bills) tribal management of other programs, such as key rural development, FSA direct lending, or conservation programs.

Profound efficiencies could be gained and more

tribal lands and tribal programs could be supported by housing the governmental functions of key infrastructure, lending, or conservation programs within tribal headquarters. NRCS has already placed federal NRCS liaisons in key tribal headquarters;

FSA has already opened field offices on tribal lands; and the Farm Bill already contains a provision allowing the placement of USDA field offices (RD, FSA, NRCS) in tribal headquarters. Additionally, tribal governments already manage key health and wellness programs, health clinics and

hospitals, housing, and construction and transportation programs authorized by other federal departments. As federal funding and staffing levels continue to decline, engaging with Indian Country on deployment of USDA programs in concert with tribal government leadership needs to be seriously considered. Congress needs to pass legislation to allow these governmental functions which impact so many tribal citizens to be managed by tribal governments.

The Office of Tribal Relations is a critical conduit for tribal governments, communities, organizations, and producers to advocate for and on behalf of USDA's interactions with tribes. The creation of an Office of Tribal Agriculture would augment the role of the Office of Tribal Relations by focusing specific attention on food production on tribal lands.

Solid data is also required. The National Agricultural Statistical Service (NASS) conducts the Agriculture Census every five years. The NASS has done an important job collecting data within Indian Country more effectively, and we owe our increased knowledge and deeper data concerning tribal food production to them. The information collected at the Bureau of Indian Affairs is not the same information collected by NASS, and the NASS data is the data

Profound efficiencies could be gained and more tribal lands and tribal programs could be supported by housing the governmental functions of key infrastructure, lending, or conservation programs within tribal headquarters.

upon which USDA programs are calibrated and grounded. Nevertheless, NASS has acknowledged that the data it has on Indian Country may be under-counted by half. Support for maintaining the work of NASS in Indian Country is needed.

Additional opportunities in the Miscellaneous Title include:

Increase Cooperative Agreements between APHIS and Tribes

Enhanced authority for the livestock and plant disease agency of the USDA – Animal and Plant Health Inspection Service (APHIS) – could dramatically increase the number of cooperative agreements it has with tribal governments and tribal organizations. Since tribal lands are among the most remote in the United States, it is important to ensure that animal and plant health is monitored closely and that animal and plant disease is dealt with properly and in ways that do not cripple Native agriculture and food production. Increasing the amount of funding of cooperative agreements is an important way to not only further the growth of agriculture management and governmental control at the tribal government level, but also meet the goals and concerns of APHIS.

Recognize Tribal Departments of Food and Agriculture

All agencies within the USDA and the Office of Intergovernmental Affairs at USDA permanently recognize and incorporate “Tribal Departments of Food and Agriculture” into their ongoing interface with other offices of government.

Tribal Consultation and Consideration of COOL Impacts on Tribal Producers

Any future work on Country of Origin Labeling must take into consideration the unique needs of Indian Country and should not impose any unfunded

mandates or restrictions on the sovereignty of tribal governments. Careful weighing of any future regulations in this area must incorporate a separate tribal consultation component and regularly discussions with tribal producers and tribal agriculture organizations.

Education, Training and Scholarship Programs to Support Native Producers and Scientists

Develop a new program that focuses on educating and training of the tribal agriculture labor force, provides key scholarships to Native producers, and encourages Native scholars and scientists to focus on food and agriculture. USDA currently has multiple internship, scholarship, mentoring, and other programs focused on increasing the diversity

of American agriculture by educating the next generation of tribal leaders in food and agriculture. However, Native representation is low, and outreach to Native communities is weak. A Native scholarship program should be adequately funded and coordinated throughout the land grant system. A minimum of \$10 million is needed to adequately endow a centralized scholarship fund

for Native youth and scholars. This program should be managed by the Office of Tribal Relations and any new Office of Tribal Agriculture that is created.

Maintain and Fund the Technical Assistance Network

The Technical Assistance Network, which has been in place for more than five years through a cooperative agreement between USDA and the Intertribal Agriculture Council, must be permanently maintained and funded through contributions from each of the agencies and offices of USDA. This effort should be funded at least \$2 million to \$3 million annually and it must continue to maintain regional offices in each of the 12 BIA regions to ensure access for all of our Native producers.

.. ———— x Λ x ———— ..

Develop a new program that focuses on educating and training the tribal agriculture labor force, provides key scholarships to Native producers, and encourages Native scholars and scientists to focus on food and agriculture.

Interdepartmental Task Force on Indian Agriculture

The Office of Tribal Relations, the Office of the Secretary, and representatives of each of the agencies and offices of USDA, along with the Bureau of Indian Affairs (BIA), should be required to take part in an Interdepartmental Task Force on Indian Agriculture. The purpose of the Task Force shall be to develop administrative efficiency and regulatory changes needed to ensure Native agriculture is supported and allowed to increase. The Task Force shall be required to report annually to the Secretary of Agriculture and the Secretary of Interior.

OAO Outreach and Internships for Native Students

The USDA Office of Advocacy and Outreach (OAO) should be required to fund internships (temporary placements) for Native students at a

level equal to the number of internships the office supports for any other socially disadvantaged group (e.g., Hispanic, African American, Asian American, women, etc.). The OAO has been inconsistent in funding these internships for Native students and they should be required to do so, if they fund members of other groups.

The Tribal Liaison position within the OAO offices that focuses on the relationship between the American Indian Higher Education Consortium and USDA (and staffs the joint leadership council of AIHEC and USDA officials) should be moved immediately to the Office of Tribal Relations.

Coordination with BIA on Agricultural Resource Management Plan

The BIA should be required to coordinate with USDA in all aspects of supporting any tribe that wishes to

draft and implement (including receiving Secretary of Interior support) an Agricultural Resource Management Plan, authorized under the American Indian Agricultural Resource Management Act of 1993 (AIARMA). This act has never been fully implemented and only a few tribes have placed a plan in motion. The BIA, working in concert with USDA, should prioritize finding resources to assist tribes (including technical assistance resources) in establishing plans authorized under the act. The BIA should be required to accept any conservation plan or forest management plan conducted by the NRCS or USFS agencies within USDA as equivalent to any environmental assessment deemed necessary in implementing the AIARMA. Tribes should not be required to conduct a full NEPA analysis to conduct food and agriculture operations on their lands, as such a requirement is far more than any applicable law and this interpretation violates principles of rights to food, food access, environmental or food justice, and food sovereignty.

Increase FSMA Technical Assistance Funding for Tribal Producers

Food Safety Modernization Act training and technical assistance funding should be increased for tribal producers. There are unique legal, jurisdictional, production, water, land use, and related issues and concerns regarding its implementation that will inhibit tribal food production if not addressed through enhanced food safety training and technical assistance. The Native American Outreach, Training, Technical Assistance, and Education cooperative agreement funded through the FDA is attempting to reach the technical assistance and training needs of tribal producers, but USDA is not funding such efforts on a regular basis. The Farm Bill should require that the FDA double the amount of funding received by the Native outreach organization, since that organization is required to conduct activities that cover twice the land base that any other regional

training center covers. The Farm Bill should also require that the USDA fund an additional equivalent amount of activities to ensure that tribal producers are reached with this information, which will be vital to their compliance and their ability to reach markets for their products.

Tribal Representation on All Federal Advisory Committees

USDA should be required to recruit and appoint tribal members to each of the more than 100 federal advisory committees it seats and supports. In addition, the Council for Native American Farming and Ranching should receive funding to support its work, and it should become a permanent FACA advising the Secretary and the USDA.

USDA should be required to work alongside other relevant federal departments to ensure that weather reporting systems and stations are located on tribal lands throughout the U.S., because the gathering of that information is vital to predicting production yields and assessing disaster impacts, among other weather-related needs. Currently, very few weather reporting stations are located on tribal lands, and USDA should take the lead in working with other departments to ensure this is addressed.

Buy Indian and Indian Preference for USDA Food Purchasing

In addition to the tax credits for “buy Indian” agriculture, the language that controls all contracting and procurement by USDA, including the language that controls the procurement of food, should be amended to not only recognize and support a “buy Indian” provision, but should also allow an “Indian preference” particularly when USDA is purchasing any product, including food, being utilized by Native people within their communities (such as food in the commodity food programs).

.. ——— x ^ x ——— ..
USDA should be required to recruit and appoint tribal members to each of the more than 100 federal advisory committees it seats and supports.

Make the Indian Agriculture Trust Fund Available to All Tribes

While the creation of an Indian Agriculture Trust Fund is an important goal, Congress should require that all funds used in the trust fund should also be available to tribes in other parts of the country and that a study should be performed by USDA to find other similar sources of income to fund such trust fund and report back to Congress as to the findings. The need for such a trust fund is pervasive throughout Indian Country, not just in the Midwest or Missouri River basins and watersheds.

USDA and BIA Work Group on Farming and Ranching

Finally, USDA and the BIA should be required to form a permanent working group that examines all aspects of the interface of farms and ranches on tribal lands, and reports annually to both the Secretary of Agriculture and the Secretary of Interior concerning administrative changes that should be made to further the access of tribal governments, producers, and food businesses to all programs and authorities of USDA.

CONCLUSION

For too long, Indian Country's voice in the Farm Bill debate has been limited to a few incredible individuals and organizations who have carried the water for the past several decades. This document encapsulates this Herculean effort and shows the full breadth of opportunities the Farm Bill offers Indian Country. The next Farm Bill could be a \$1 trillion spending influx for agriculture and rural development.

The time to act is now. By adjusting, developing and improving the Farm Bill's programs, we can build upon the already great work happening in our communities surrounding food and agriculture. We can improve and expand our infrastructure. We can develop our food systems. We can provide the means for our agriculture businesses to thrive. We can continue to address and improve the health of our people.

Indian Country must not only have a seat at the table during the Farm Bill debate, but must be a chorus of voices speaking loudly and strongly for our food and agriculture producers and our tribal communities. Improving the Farm Bill for Indian Country will help bolster our work to achieve the truest form of sovereignty: feeding ourselves in our own foods systems with our own foods.

ABOUT THE AUTHORS

JANIE SIMMS HIPPI, J.D., LL.M.

Director

Indigenous Food and Agriculture Initiative
University of Arkansas School of Law
jhipp@uark.edu

Janie Simms Hipp, JD, LL.M is a citizen of the Chickasaw Nation. She serves as the director of the Indigenous Food and Agriculture Initiative at the University of Arkansas School of Law. She is the former senior advisor for tribal relations to Secretary Tom Vilsack, United States Department of Agriculture (USDA). Prior to her appointment in that role, she served as a national program leader at the National Institute for Food and Agriculture, USDA and as the risk management education director at the USDA Risk Management Agency. She has more than 30 years of experience in the areas of agriculture and food law and Indian law.

Janie leads the Indigenous Food and Agriculture Initiative's partnership with the Shakopee Mdewakanton Sioux Community's Seeds of Native Health campaign. With a leading gift from Seeds of Native Health, Janie and her team is conducting a landmark project to develop a long-needed, comprehensive set of model food and agriculture codes to be customized and adopted by tribal nations. Additionally, the SMSC and IFAI are partnering with the Corporation for National and Community Service to create a cadre of 21 "Native Food Sovereignty Fellows." IFAI is recruiting, training, deploying and supervising the work of these VISTA volunteers in 10 tribal communities.

COLBY D. DUREN, J.D.

Policy Director and Staff Attorney

Indigenous Food and Agriculture Initiative
University of Arkansas School of Law
cduren@uark.edu

Colby Duren is the policy director and staff attorney for the Indigenous Food and Agriculture Initiative at the University of Arkansas School of Law. Based in Washington, D.C., Colby has nearly 10 years of experience in federal Indian law and policy, with a specific focus on food, agriculture, and natural resources issues. Prior to joining the Initiative, Colby served as a staff attorney and legislative counsel for the National Congress of American Indians in Washington, D.C., advocating on behalf of tribal nations on land, natural resources, and agriculture issues, including the 2014 Farm Bill. Previously, he was a legal assistant for the Native American Rights Fund and a paralegal and legislative assistant at a Washington, D.C.-based law firm specializing in food and agriculture and representing tribes on land reparation and agriculture issues. Colby earned his law degree from the American University Washington College of Law in Washington, D.C., and his bachelor of arts from Vassar College in Poughkeepsie, New York.

SHAKOPEE MDEWAKANTON SIOUX COMMUNITY

The Shakopee Mdewakanton Sioux Community is a federally recognized, sovereign Indian tribe located southwest of Minneapolis/St. Paul. Making its top priority to be a good neighbor, the SMSC is one of the top philanthropists in Minnesota and donates more to charity than any other Indian tribe in America. It also focuses on being a strong community partner and a leader in protecting and restoring natural resources. More information is available at ShakopeeDakota.org.

SEEDS OF NATIVE HEALTH

Seeds of Native Health is the Shakopee Mdewakanton Sioux Community's philanthropic campaign to improve Native American nutrition and food access. Launched in 2015, the \$10 million campaign has provided grants to local communities and funded research, education, and capacity-building efforts. Partners include the American Diabetes Association, American Heart Association, AmeriCorps VISTA, Better Way Foundation, the Federal Reserve Bank of Minneapolis's Center for Indian Country Development, First Nations Development Institute, MAZON: A Jewish Response to Hunger, the Notah Begay III Foundation, the University of Arkansas School of Law's Indigenous Food and Agriculture Initiative, and the University of Minnesota. More information is available at SeedsofNativeHealth.org.

Section 1 Executive Summary

Since 1974, the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) has enhanced access to healthy foods and delivered critical nutrition services for new and expectant parents, babies, and young children. WIC has a long history of innovating to strengthen the impact of its public health services, including a nationwide transition to electronic-benefit transfer payments (EBT) in retail settings in the 2010s. For WIC to maximize its proven nutrition support, swift and focused action is critical to provide a modern, accessible, and equitable shopping experience for the nearly 6.4 million current participants and the next generation of WIC families.

The Consolidated Appropriations Act for fiscal year 2021 (Pub. L. No. 116-260) authorized the U.S. Department of Agriculture (USDA) to convene a Task Force on Supplemental Foods Delivery (“Task Force”) to “study measures to streamline the redemption of supplemental foods benefits that promote convenience, safety, and equitable access to supplemental foods, including infant formula”. The Task Force was specifically instructed to review online and telephonic ordering, curbside pickup and payment, online and telephone purchasing, home delivery, self-checkout, and other measures that limit or eliminate consumer presence in a physical store.

The Task Force was convened in March 2021 and met regularly through the time of publication of this report. The Task Force’s work was informed by prior and parallel processes to modernize shopping options for USDA nutrition programs, including: USDA staff scaling up the Supplemental Nutrition Assistance Program (SNAP) Online Ordering Pilot Project; the Gretchen Swanson Center for Nutrition, which administers the USDA WIC Online Ordering Grant; the WIC Online Ordering/Purchasing/Home Delivery Working Group, convened by the National WIC Association in spring 2020; and additional pilot projects and local innovations being developed across the country. The Task Force consisted of the following 18 member organizations, cutting across multiple sectors to ensure a diverse range of input from WIC providers, retailers, manufacturers, EBT processing companies, advocacy organizations, WIC participants, and additional stakeholders. Additional information about each member and their organization can be found in *Appendix A: Task Force Member & Organization Information*.

- Melinda Newport (Task Force Chair), Chickasaw Nation, Department of Health, Nutrition Services
- Ellen Thompson (Task Force Vice Chair), Maximus, Inc.
- Mary Anne Burghardt, North Carolina Department of Health and Human Services
- Maria Caranfa, Kellogg’s
- Brian Dittmeier, National WIC Association
- Sarah Flores-Sievers, New Mexico Department of Health
- Jennifer Hatcher and Hannah Walker, FMI - The Food Industry Association
- Kurt Helwig, Electronic Funds Transfer Association, eGovernment Payments Council
- Cary Jeffers, Fidelity National Information Services
- Chuck Layosa, Inter-Tribal Council of Nevada
- Angela Milroy, First Data Corporation/FISERV
- Robert Rankin, Infant Nutrition Council of America
- Jay Saunders, GCOM – Three Sigma
- Hannah Smith, Food City/KVAT Foods Inc.
- Candice Trujillo, Southwest Region WIC Program, Las Cruces, NM
- Hannah Walker and Tres Bailey, Walmart, Inc.
- WIC Participant [name redacted for privacy purposes]
- WIC Participant [name redacted for privacy purposes]

The Task Force was assembled in the midst of the COVID-19 pandemic, which presented public health challenges to the in-person shopping experience. During the pandemic response in 2020, USDA recognized the imperative to provide a broader range of shopping options for participants in federal food assistance programs, significantly scaling up the SNAP online purchasing pilot to permit online shopping with SNAP benefits. Similar initiatives were not immediately feasible for WIC participants, as the SNAP and WIC programs have wide-ranging differences in their structure, administration, funding, and approach to transaction processing. In addition, SNAP had been developing online purchasing solutions since it was first authorized in the 2014 Farm Bill.

The need for modern shopping options for WIC participants predates the pandemic. WIC is an effective program that delivers healthier outcomes for participating families through nutrition education, supplemental nutritious foods, and referral to health care and other service programs. However, eligible individuals are less likely to access WIC services if the shopping experience is overly burdensome or stigmatizing. Driving innovation in WIC transaction platforms both affirms equitable treatment for low-income families and invests in the long-term health of America’s next generation. The Task Force urges swift and focused USDA action to partner with WIC providers, retailers, suppliers, technology experts, processors, and all other interested stakeholders to develop and implement modern, forward-looking solutions that streamline the WIC transaction.

Online purchasing is currently prohibited in program rules, and the regulations do not allow for transactions via a virtual platform. To support the modernization of WIC benefit delivery, USDA must address outdated WIC regulations – many dating from an era when WIC benefits were issued on paper vouchers. These dated regulations are a significant barrier to present and future benefit innovation. Since the establishment of the Task Force, USDA has indicated in the Unified Regulatory Agenda that it will pursue rulemaking later in 2021 to address regulatory barriers to online ordering and modernize relevant regulations. **The Task Force urges that this report be considered in developing the proposed rule and serve as a foundation for additional stakeholder input during notice and comment in the rulemaking process.**

In contemplating the steps that would reduce regulatory barriers and unleash the potential of new delivery systems, the Task Force adopted four guiding principles as part of the development of its recommendations:

- **Pursue the most intelligent ordering and payment approach to the extent possible.** WIC benefits are issued monthly by food category. In a paper voucher system, participants had forfeited benefits when all issued foods on a food instrument were not redeemed in a single transaction. With the introduction of EBT and other forward-looking technologies, participants are permitted to redeem discrete items and conduct multiple transactions throughout the benefit month. When developing new transaction models, participants should have the clearest picture possible of their remaining benefits balance at all points of the transaction. This information should be used as part of the transaction to ensure that the appropriate foods and quantity limits are applied. While it is our preference that the most intelligent ordering and payment approach is pursued, the Task Force does not want to limit a vendor from using a less intelligent approach such as a telephonic ordering if it allows them to support improved service delivery to WIC customers.
- **Following existing commercial models, where possible.** WIC innovation builds on existing progress by the retailer community to scale up online shopping platforms for SNAP recipients and the general shopping public. In many cases, retailers will seek to create interoperable virtual platforms that can accommodate transactions across federal nutrition programs. WIC reforms

and innovation should be mindful of existing commercial models to prevent significant reformulation of existing platforms.

- **Treat WIC participants equally to other retail consumers.** WIC participants deserve an equitable and safe shopping experience that is equivalent to the general shopping public. Secure platforms should be established that ensure WIC participants can access the same variety of online shopping options without stigma, added difficulty, or personal cost.
- **Focus on best practices.** As retailers and WIC providers scale up new platforms, it is critical that existing safeguards continue to ensure convenient, safe, and equitable access. WIC innovation must continue moving forward to remain on par with, or even ahead of, other commercial transaction technologies. WIC EBT remains a relatively recent option, even though similar technology was available to the shopping public decades prior. Working within the parameters of WIC's federal purpose, new technologies should ensure convenient and equitable access to supplemental foods. WIC transaction models should inform broader innovation for retailer platforms, while also staying abreast of advances made on SNAP and other commercial platforms and ensuring responsible program integrity.

With these guiding principles, the Task Force proceeded with outlining the approach to online ordering and purchasing that we believe is the most intelligent option, follows commercial models, focuses on best practices, modernizes the regulatory framework, and provides for the best end user experience. The Task Force is cognizant that the approach recommended (and in fact, any approach) will require system updates and/or new development for all WIC stakeholder systems to include retailers, EBT processors, third party processors (TPPs), and WIC management information systems (MIS). The extent of the modifications will vary across systems, but in all cases, there will be a cost and time necessary to make the changes. To that end, the Task Force recommends moving forward with modernizing the WIC shopping experience in a way that upholds the safety and integrity of the delivery of WIC food benefits but doing so as quickly and efficiently as possible. We recognize there may be a need for interim stages that involve less intelligent methods in order to move online ordering and purchasing forward toward the long-term goal of the Task Force's recommended approach. Additionally, the Task Force agrees that designated funding to support system changes and other costs associated with the implementation of online ordering and purchasing for all WIC State Agencies will be critical to the success and timeliness of the efforts.

This final Task Force report includes comprehensive recommendations to USDA on next steps to advance WIC innovations associated with modern transaction models and participant redemption of supplemental foods. The report includes: in Section Two, definitions for terms utilized throughout the report; in Section Three, a narrative detailing recommendations on how transactions should be processed with the introduction of virtual platforms to WIC; in Section Four, a summary of proposed regulatory changes that will enhance innovation and reduce barriers to scaling up online shopping platforms; and in Section Five, a summary of additional considerations as USDA partners with stakeholders in the regulatory process to achieve progress in the WIC retail space.

Section 2 Glossary of Terms

Throughout the report, WIC and EBT specific terminology and acronyms are used. For your reference, we have provided a glossary of terms and their definitions as they have been used in this document.

Current Regulatory Definitions

A-50 Vendors	WIC vendors that derive more than 50 percent of their annual food sales revenue from WIC food instruments, and new vendor applicants expected to meet this criterion under guidelines approved by FNS.
CVV (or CVB)	Cash-Value Voucher means a fixed-dollar amount check, voucher, Electronic Benefits Transfer (EBT) card or other document which is used by a WIC participant to obtain authorized fruits and vegetables. Cash-value voucher is also known as cash-value benefit (CVB) in an EBT environment.
Days	Days mean calendar days.
EBT	Electronic Benefit Transfer (EBT) means a method that permits electronic access to WIC food benefits using a card or other access device approved by the Secretary.
Food Instrument	Food Instrument means a voucher, check, electronic benefits transfer card (EBT), coupon, or other document or platform? which is used by a participant to obtain supplemental foods.
FNS	Food and Nutrition Service. The agency within USDA that administers domestic food assistance programs.
Inventory Audit	Inventory audit means the examination of food invoices or other proofs of purchase to determine whether a vendor has purchased sufficient quantities of supplemental foods to provide participants the quantities specified on food instruments redeemed by the vendor during a given period of time.
Participants	Participants mean pregnant women, breastfeeding women, postpartum women, infants, and children who are receiving supplemental foods or food instruments or cash-value vouchers under the Program, and the breastfed infants of participant breastfeeding women. (Task Force Note: <i>For the purposes of this document, this term includes participants, parents/caretakers, and proxies that might redeem WIC benefits.</i>)
Peer Group	A classification of authorized vendors into groups based on common characteristics or criteria that affect food prices, for the purpose of applying appropriate competitive price criteria to vendors at authorization and limiting payments for food to competitive levels.
Rebate	Rebate means the amount of money refunded under cost containment procedures to any WIC State Agency from the manufacturer of a particular food product as the result of the purchase of the supplemental food with a voucher or other purchase instrument by a participant in each State's agency program.

Such rebates shall be payments made subsequent to the exchange of a food instrument for food.

Secretary

Secretary means the Secretary of Agriculture.

SNAP

Supplemental Nutrition Assistance Program (SNAP), formerly known as the Food Stamp Program, is the program authorized by the Food and Nutrition Act of 2008 (7 U.S.C. 2011, et. seq.), in which eligible households receive benefits that can be used to purchase food items from authorized retail stores and farmers' markets.

Supplemental Foods

Supplemental Foods means those foods containing nutrients determined by nutritional research to be lacking in the diets of pregnant, breastfeeding and postpartum women, infants, and children, and foods that promote the health of the population served by the WIC Program as indicated by relevant nutrition science, public health concerns, and cultural eating patterns, as prescribed by the Secretary in 7 CFR 246.10.

Vendor

Vendor, as currently defined in the regulations, means a sole proprietorship, partnership, cooperative association, corporation, or other business entity operating one or more stores authorized by the State agency to provide authorized supplemental foods to participants under a retail food delivery system. Each store operated by a business entity constitutes a separate vendor and must be authorized separately from other stores operated by the business entity. Each store must have a single, fixed location, except when the authorization of mobile stores is necessary to meet the special needs described in the State agency's State Plan in accordance with § 246.4(a)(14)(xiv).

Vendor Authorization

Vendor Authorization means the process by which the WIC State Agency assesses, selects, and enters into agreements with stores that apply or subsequently reapply to be authorized as vendors. (Task Force Note: *This process is distinct from payment authorization for individual transactions.*)

WIC State Agency

The health department or comparable agency of each State; an Indian tribe, band or group recognized by the Department of the Interior; an intertribal council or group which is an authorized representative of Indian tribes, bands or groups recognized by the Department of the Interior and which has an ongoing relationship with such tribes, bands or groups for other purposes and has contracted with them to administer the Program; or the appropriate area office of the Indian Health Service.

Additional Terms Used Throughout This Report

Account Balance

The issued benefits available that can be redeemed, in real-time, for supplemental foods. In EBT and other virtual settings, this balance can be verified against electronic records in the WIC State Agency MIS.

CFR	The Code of Federal Regulations. The codification of the general and permanent rules published in the Federal Register by the executive departments and agencies of the federal Government. The CFR includes the Federal requirements for WIC in Title 7, Part 246.
Food Category	A numbering sequence of two digits used to identify broad WIC food groups.
Food Sub-Category	A numbering sequence of three digits following the Food Category that identifies the foods, brands, and size of food item within each food group.
Home Delivery	The process in which a participant can receive supplemental foods redeemed with WIC program benefits at their home address, delivered by either the retailer or a third-party entity. Unless otherwise noted, this is distinct from a home delivery food delivery system that is currently authorized in 7 CFR 246.12.
MIS	Management Information System. The system used by a WIC State Agency to manage participant information and issue WIC benefits.
Mobile Payment	The process in which a participant can use a portable device, other than an EBT card, to conduct a WIC transaction that redeems benefits for issued supplemental foods.
Offline EBT	An EBT system that uses a payment card that has a computer chip embedded on the card. All WIC transactions are completed by updating the WIC food balances on the chip at the time of the sale.
Online EBT	An EBT system where the transaction is completed in real-time through messages sent from the Card Acceptor Device through the network to the WIC State Agency or their EBT Card Issuer Processor.
Online Ordering	The process by which a participant can use the Internet or another virtual platform, accessible to the general public, for the purposes of selecting food items for purchase.
Online Transaction	The process by which a participant can use the Internet or another virtual platform, accessible to the general public, for the purposes of conducting a WIC transaction that redeems benefits for issued supplemental foods.
PIN	Personal Identification Number. Participant-selected four-digit identifier required to be entered for all electronic EBT transactions.
Settlement	The process by which an authorized vendor is reimbursed for transacted benefits by the WIC State Agency.
	Task Force The Task Force on Supplemental Foods Delivery in the Special Supplemental Nutrition Program for Women, Infants, and Children, established by Section 723 of the Consolidated Appropriations Act of 2021.
Transaction	The process by which a WIC participant redeems supplemental foods with WIC benefits.

- USDA** The United States Department of Agriculture. The Federal department responsible for agricultural production, rural services, and food assistance programs.
- WIC** The Special Supplemental Nutrition Program for Women, Infants, and Children, authorized by section 17 of the Child Nutrition Act of 1966, 42 U.S.C. 1786.

Section 3 Online Ordering Process Recommendations

The Task Force has developed a set of recommendations related to how a WIC online order and purchase may ideally be accomplished. These recommendations follow the general guidelines outlined in the Executive Summary:

- Pursue the most intelligent ordering and payment approach to the extent possible.
- Follow existing commercial models where possible.
- Treat WIC participants equally to other retail consumers.
- Focus on best practices.

The online ordering and purchasing process is composed of four phases which are described in this section along with the Task Force's recommendations related to each phase. Note that some of these recommendations will require regulatory changes in order to be implemented. The related regulatory changes have been identified in *Section 4: Regulatory Recommendations*.

Ordering

Ordering is the initial phase of the process that starts when the participant accesses the ordering platform and involves the selection of products and the authorization of the purchase. This phase concludes upon submission of the order. The Task Force has identified the following recommendations related to the ordering phase.

- **The account balance should be available for use during the shopping/ordering experience.** A best practice would be for the participant to have access to their balance early in the process when shopping online. Having the WIC balance available 1) ensures that they have sufficient benefits for their purchase, and 2) allows the online shopping platform to support functionality that can aid in the shopping experience to include identifying WIC items available to the participant and showing an expected remaining balance as items are added to the cart. While it is possible for an online shopping platform to operate without obtaining the balance, it can result in participants selecting items that were not issued or selecting a larger quantity than authorized. These errors would not be identified until the items are picked up and the transaction processed.
- **Accessing Balance Inquiry Data:** The ordering system may use commercial transaction processing methods to obtain the balance, but other methods such as web-services (like those that exist in the WIC Universal MIS-EBT Interface) may also be considered. Whatever the method, appropriate security and validation protocols must be in place to verify the online retailer is authorized, that the account is valid, and that the participant is validated using a secure method of authentication.
- **Purchase Authorization:** The Task Force recommends that implementers use an approach whereby the WIC items that will be purchased as part of the online order are authorized for purchase at the completion of the ordering process, but rather than deducting the benefits, a hold is placed on the benefits until the order is fulfilled at which point the purchase is completed. This approach is similar to transactions at a gas pump where the purchase is preliminarily authorized for a certain value (often \$100). When the driver finishes filling their tank and replaces the pump, the system submits the final transaction amount which clears the hold and completes the purchase.

As part of our research, the Task Force met with FNS staff involved in the SNAP online purchasing project and discussed the authorization and clearing approach. FNS indicated they had discussed it but decided to move forward with an approach where the purchase is completed at the time of the order. However, if there are adjustments in the fulfillment process the retailer must process a refund transaction to address any price differences. It was noted that a two-part authorization and purchase finalization might address some of the issues they are having with adjustments and refunds post fulfillment. In addition, retailers involved in SNAP online ordering provided feedback indicating a preference for the two-part approach.

The authorization and purchase finalization approach is not currently used in WIC EBT processing and would require additional transaction types to be developed. However, the Task Force agrees that for online ordering a two-part process would be the preferred method to account for adjustments or substitutions during the fulfillment process when originally selected products are not available.

The authorization and purchase finalization approach includes the following components:

- The participant would select their products and initiate their order.
- At the time of the order submission, an authorization transaction would place a hold on the benefits in the participant's account in the quantities required to complete the purchase.
- Benefits would not be deducted from the account until the order is fulfilled and any substitutions are addressed.
- Following the fulfillment of the order, a purchase finalization transaction would be completed to deduct the benefits based on the final list of items and quantities in the order. The quantity of benefits deducted in this transaction shall not exceed the quantity included in the authorization.
- The hold placed on any items not included in the final purchase will be removed as part of the purchase finalization.
- The participant can cancel the order at any time up to the point of fulfillment prior to completion of the final clearing transaction thereby canceling the hold on the benefits.
- Upon cancellation of the order, the hold that had been placed on the participant's benefits will be immediately released and available for use.
- The purchase authorization process applies to all authorized vendors.
- **Split Tender:** Online ordering systems should support split tender transactions (a transaction where the participant can pay with their WIC benefits and then use another form of payment or tender type to pay for the remaining items in the basket). Split tender transactions are currently allowed in physical retail locations. In a split tender transaction, WIC must be tendered before all other payment types because it is the most restrictive tender.
- **Mixed Basket:** A mixed basket purchase is one where both WIC and non-WIC items are commingled. Mixed basket transactions are allowed currently in physical retail locations. Online ordering systems should also support mixed basket purchases. System developers may consider offering solutions with multiple views that allow a WIC participant to see and purchase only WIC items in addition to offering the full array of WIC and non-WIC products.

Fulfillment

The fulfillment phase begins following the submission of the order and transaction authorization. It includes all processes related to the selection of items based on the order. If items selected by the participant are no longer available at the time of fulfillment or there is a quantity difference due to the weight of an item (such as produce) those changes need to be addressed in the final purchase by updating the items and quantities that are ultimately included in the order. This phase ends when all items have been collected, any substituted items have been updated within the transaction, and the items have been prepared/packaged for pick up or delivery. The Task Force has identified the following recommendations related to order fulfillment.

- **Allowing Item Substitution:** Items are allowed to be substituted with the consent of the participant. Only items within the same food category and subcategory of the previously selected item may be substituted. For example, if the participant selected an 18 oz box of Cheerios (category 05, subcategory 001), but that item was not available, then if approved by the participant, the fulfillment staff person can choose another 18 oz (or smaller) WIC approved cereal such as an 18 oz box of Kix or a 12 oz box of Cheerios.¹
- **Validating Substituted Items:** If approved by the participant, substitutions must be validated to ensure that it is an allowable WIC food authorized by the State Agency in which the participant is participating and that there are sufficient benefits in the participant's account to purchase the item. Any items that are substituted for items previously selected in the ordering process must be included/updated in the final clearing transaction so that the purchase transaction data accurately captures the items included in the final order. WIC vendors can determine the best way to approach substitution validation, one approach discussed by the Task Force was for the fulfillment staff member to have a handheld device or smartphone that could be used to scan potential substitutes and update the order as the substitute is selected.
- **Weighted Items:** Some produce items are priced by item and some by weight. A participant may specify an exact weight for a weighed produce item, but in the fulfillment process there may be slight variations in sizes and weights. The Task Force recommends that the participant have the ability to identify the maximum weight and the associated cost they would like to set for a weighted item. The fulfillment staff person would then pick products that are equal to or less than the maximum cost without exceeding it. The order would be updated with the actual product cost. Any quantity of the authorized maximum cost that is more than the actual cost will not be deducted from the participant's balance as part of purchase finalization.

Purchase Completion/Receipt of Goods

The purchase completion and receipt of goods phase involves the application of any delivery fees, finalization of the purchase, and then either the delivery of the order or the pick up of the order by the participant, in store or curbside. This phase ends when the participant takes possession of the food items in the order. The Task Force has identified the following recommendations related to this phase of the ordering process.

¹ Note that infant formula benefits are issued specifically by brand, form, and size for example Enfamil A.R. Infant Formula Powder 12.9 oz can. Each infant formula is assigned to its own subcategory which in most cases is associated with one specific product and one UPC. Within the EBT transaction, it is not possible to substitute an infant formula for another brand, form, or size.

- **Fees:** WIC benefits shall not be used to pay for fees related to online ordering, a separate tender may be used to cover the cost of allowable fees. Note this is consistent with the approach used for SNAP online purchases.

Additionally, the Task Force recommends the following related to delivery fees:

- Retailers shall not impose fees for fulfilling an order but may charge for delivery.
 - If a retailer has a policy that requires minimum purchase amount for free delivery, the same policy may be applied to WIC participants.
 - A retailer may reserve the right to waive fees at their discretion, even if only for WIC participants.
 - Only one fee shall be applied per order even if multiple tender types are used or if the items are required to be split between multiple deliveries or shipments.
 - Information about fees shall be transparent and provided to the participant as early as possible during the shopping experience so that the participant knows if there are any minimum purchase amounts for free delivery and considerations of the cost of delivery, but no later than the selection of “delivery” as the method of receipt of food benefits.
- **Final Payment/Completion of Purchase:** The purchase finalization transaction that is performed by the vendor can occur at any time following the completion of order selection/confirmation resulting in an authorization of the benefits up to the point at which the customer arrives at the pickup location to retrieve their order or, optionally for food delivery, the point at which the food will leave the retailer’s location for delivery. Where possible, the retailer should follow their purchase authorization and completion processes used for non-WIC online orders. Vendors may provide a digital receipt at the completion of the purchase and satisfy the requirements.
 - **Benefit Expiration Grace Period:** Because the recommended approach involves a two-step process of authorization and finalization, it is possible that these steps may not occur on the same day. Therefore, it is necessary to address benefit expiration between these two points in the payment process. The Task Force recommends for online ordering that a grace period of 3 days be allowed to complete the purchase when benefits have been authorized prior to the expiration date, but the order is not completed/fulfilled until after the expiration date.

Post Pick Up/Post Delivery

Post Pick Up/Post Delivery is the final phase of the process. This phase starts when the order is received or picked up by the participant. In most cases, that should be the end of the process; however, if there is an issue with items in the order, the retailer will need methods to address the problem. It is assumed that retailers will want to make right any errors, omissions, or spoiled products. The Task Force has identified the following recommendations related to this phase of the ordering process.

- **Support for a Refund/Adjustment Transaction to Address Post-Purchase Issues:** While the Task Force believes that the approach of using a purchase authorization and purchase finalization will address item changes that may occur due to approved and verified substitutions during the fulfillment process, situations may occur that require an adjustment after the completion of the purchase finalization.

- For this reason, the Task Force recommends that a transaction that allows for the adjustment or refund of the cost of individual items be part of the online ordering transaction set to credit the participant's balance to rectify errors, omissions, or other issues within an order.
- Refunds should be an exception process. When this functionality is implemented, it should be added to program integrity monitoring activities.
- The State Agency should develop a mechanism to reverse rebate requests for any items that have been refunded for which a rebate has been requested.

Section 4 Regulatory Recommendations

The WIC online ordering and purchase process recommendations documented in Section 3 provide the Task Force's consensus on how the processes should be accomplished; however, under current regulations some aspects of this process would not be allowed. In developing our recommendations, the Task Force reviewed materials from FNS, the Gretchen Swanson Center for Nutrition and the National WIC Association that documented regulations that have an impact or may hinder State Agencies from implementing online ordering and purchasing, as well as additional vendor authorization, vendor monitoring, and clinic-based processes that require in-person interactions that can be minimized through technology advances. In addition, Task Force members reviewed the regulations for any other items that could impact overall modernization efforts for WIC benefit delivery.

In the following section, the recommendations that impact future innovation and program modernization have been identified. For each, there is a description of the regulation or restating of the language, an assessment of the potential impact to future modernization, and recommendations for changes to the regulation(s). Specific language changes are noted in red text otherwise a conceptual change is noted for which regulatory language may need to be developed. Three tables are included: Table 1 outlines proposed definitions for regulatory terms, including revisions to existing regulatory definitions in 7 CFR 246.2; Table 2 outlines modifications to regulations that govern vendor authorization, vendor management and transaction processes; and Table 3 describes the impacts of proposed revisions on different vendor forms, including virtual vendors and hybrid vendors that operate both virtual platforms and physical store locations.

Table 1: Regulatory Definitions Recommendations

The Task Force noted that several of the terms used throughout the federal regulations reflect an outdated transaction model, including paper vouchers. Thorough review of the regulations should update the terminology used throughout 7 CFR 246, with additional terms defined in 7 CFR 246.2 to reflect new processes outlined in this report that would enable online shopping options for WIC participants.

Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Vendor (7 CFR 246.2): Authorized vendors are limited to stores with “a single, fixed location.”</p>	<p>Home delivery of supplemental foods may be possible under the retail food delivery system model provided that the retailer maintains a base of operations from a single, fixed, and physical location.</p> <p>The requirement for each store having “a single, fixed location” is a potential barrier to virtual-only business models.</p> <p>Establish new categories of vendors to address differing business models:</p> <ul style="list-style-type: none"> - Physical vendors: Individual, physical store locations. This includes mobile vendors that may not have a fixed operating location. - Virtual vendors: Virtual platforms that are distinct from a single, physical store location. - Hybrid vendors: Physical store locations that also operate a virtual platform. <p>See Table 3 for further detail.</p>	<p><i>Vendor</i> means a sole proprietorship, partnership, cooperative association, corporation, or other business entity operating one or more stores, a virtual platform, or a combination of purchase platforms (physical and virtual) authorized by the State agency to provide authorized supplemental foods to participants under a retail food delivery system. Each store or platform operated by a business entity constitutes a separate vendor and must be authorized separately from other stores or platform(s) operated by the business entity. Each store must have a single, fixed location, except when the authorization of mobile stores is necessary to meet the special needs described in the State agency’s State Plan in accordance with Sec. 246.4(a)(14)(xiv).</p>

Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Food Instrument (7 CFR 246.2): A voucher, check, EBT card, coupon, or other document which is used to obtain supplemental foods.</p>	<p>Food instrument is an antiquated term from the era of paper vouchers. With the possibility of multiple methods of conducting the transaction – including methods that are entirely virtual – the term food instrument could lead to further confusion. The Task Force proposes replacing food instruments throughout the regulations with “benefit.”</p>	<p><i>Benefit</i> means the authorized supplemental foods issued to a participant in a manner approved by the Secretary.</p>
<p>Virtual Platform (new definition)</p>	<p>Online ordering and transactions would not be possible without authorizing, establishing, modifying, and monitoring online platforms connected to WIC vendors. New rules should govern virtual platforms, which should operate either in conjunction with a physical store (hybrid vendor) or independently of physical store locations.</p>	<p><i>Virtual platform</i> means any technology that is accessible to the general public and equipped to process transactions to provide authorized supplemental foods to participants under a retail food delivery system. Virtual platforms must be authorized separately from physical store locations, either by State agencies or in a nationwide authorization by FNS.</p>
<p>Vendor Authorization (7 CFR 246.2)</p>	<p>The Task Force encourages exploring the option for a national authorization process, with State opt-ins, that could streamline multistate authorization for virtual vendor platforms.</p>	<p><i>Vendor authorization</i> means the process by which the State agency assesses, selects, and enters into agreements with stores that apply or subsequently reapply to be authorized as vendors. <i>Vendor authorization</i> is inclusive of the State agency decision to opt-in to a nationwide authorization of virtual platforms approved by FNS.</p>
<p>Authentication (new definition)</p>	<p>The Task Force encourages broader terminology to be inclusive of future technological innovations. Both the terms EBT and PIN could limit future development of the WIC transaction.</p>	<p><i>Authentication</i> means a method, approved by the Secretary, that allows the transaction processing system to verify that the person attempting to access the benefits associated with the account identified in the transaction is authorized to access the account and associated benefits.</p>

Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Preauthorization (new definition)</p>	<p>To enable online purchasing, the Task Force recommends that retailers be able to place a hold on issued benefits until the order is fulfilled and received by the participant. This process will account for substitutions, minimize refunds, and reduce administrative burden for retailers, processors, and WIC agencies.</p>	<p><i>Preauthorization</i> means a process approved by the Secretary to place a hold on issued benefits that a participant is attempting to redeem when a transaction has been initiated on an authorized virtual platform to access approved supplemental foods. The hold shall last for no longer than three days and shall be removed upon a clearing transaction submitted by the vendor within a period of three days.</p>
<p>Fulfillment (new definition)</p>	<p>Online ordering and purchasing require a process where retail store staff or a third party conducts the shopping and prepares the package for either pick-up or delivery.</p>	<p><i>Fulfillment</i> means a process in which an authorized vendor implements an order for redemption of supplemental foods.</p>
<p>Home Delivery (new definition)</p>	<p>Online ordering and purchasing systems should be equipped to deliver supplemental foods to participants and ensure adequate checks to confirm that participants received their ordered foods.</p>	<p><i>Home delivery</i> means the process, under a retail food delivery system, in which the retailer or a third-party entity contracting with the retailer fulfills an order initiated by the participant or proxy and provides supplemental foods to a participant’s home address.</p>
<p>Compliance Buy (7 CFR 246.2): A covert, <i>on-site</i> investigation in which a WIC representative poses as a participant and transacts one or more food instruments without revealing their role as a WIC representative.</p>	<p>Compliance buys must be conducted on-site, but this terminology will limit monitoring of virtual vendor platforms.</p>	<p><i>Compliance buy</i> means a covert, on-site investigation in which a representative of the Program poses as a participant, parent or caretaker of an infant or child participant, or proxy, transacts food benefits, and does not reveal during the purchase that they are a program representative.</p>
<p>Routine Monitoring (7 CFR 246.2): Overt, <i>on-site</i> monitoring during which program representatives identify themselves to vendors.</p>	<p>Routine monitoring must be conducted on-site, but this terminology will limit monitoring of virtual vendor platforms.</p>	<p><i>Routine monitoring</i> means overt, on-site monitoring during which program representatives identify themselves to vendor personnel.</p>

Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
Compliance Investigation (new definition)	“Compliance investigation” is utilized in numerous places in the regulations. For clarity, it should be defined.	Compliance investigation means a “compliance buy” or an “inventory audit” as those terms are defined herein.
Authorized Infant Formula Supplier	As new regulatory language refers to this term, it needs to be defined.	Shall have the same meaning as the list required in 42 U.S.C. Section 1786(h)(8)(A)(ix) (see also 7 CFR 246.12(g)(10)). The Task Force recommends that the Secretary recommends to Congress that the statute cited above be amended to provide for a federal list of authorized infant formula suppliers.

Table 2: Recommended Regulatory Changes to Support Future WIC Program Innovation

The following regulatory requirements have been identified as having an impact on WIC State Agencies’ ability to implement online ordering and purchasing as well as other technological advances. The regulations have been grouped under the following major topic areas: vendor authorization, vendor management, and transaction processing.

<i>Vendor Authorization</i>		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Uniform Food Delivery System (7 CFR 246.12(b)): Each food delivery system must be procedurally uniform throughout the State Agency’s jurisdiction.</p>	<p>The provision “food instruments must be uniform within each type of system” limits state agencies ability to implement alternative payment approaches such as using mobile payment at the same time that they use an EBT card. Having two payment types would provide the State Agency and the participants more options and would not reduce access to benefits. In most cases a State Agency may not be able to transition all participants to a new technology at once, which means that the State Agency must be able to support two methods of payment.</p>	<p>The Task Force recommends updating the regulation to allow for multiple payment options within a food delivery method. Additionally, in the regulation EBT is noted as a delivery system; however, it is a payment mechanism for a retail delivery system and therefore should be removed.</p> <p>Recommended Update: 7 CFR 246.12 (b) Uniform f Food delivery methods systems. The State agency may operate up to four any of the following types of food delivery systems under its jurisdiction - retail, home delivery, direct distribution or another method approved by the Secretary, or EBT. Each system must be procedurally uniform throughout the jurisdiction of the State agency and must ensure adequate participant access to supplemental foods. A State Agency may employ multiple payment methods within a food delivery system (e.g., EBT cards and mobile payments). When used, food instruments must be uniform within each type of system.</p>

Vendor Authorization		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>EBT requirement (7 CFR 246.12(x), (aa)(4)): State Agencies are required to operate an EBT system and shall not authorize vendors that cannot demonstrate EBT capability.</p>	<p>Although transition to EBT transaction models has been a step forward, the requirements that vendors adopt EBT could limit future innovation and more efficient models of retail transaction, such as mobile payments.</p>	<p>(4) <i>Statewide operations.</i> After completion of statewide EBT implementation, the State agency shall not: [. . .] (ii) Authorize a vendor, farmer, or farmers’ market that cannot successfully demonstrate EBT capability in accordance with State agency requirements or comparable transaction technology approved by the Secretary, unless the State agency determines the vendor is necessary for participant access.”</p>
<p>Home Delivery Systems (7 CFR 246.12(m)): State Agencies may authorize home food delivery systems that centralize food distribution outside of a retail system.</p>	<p>There may be confusion within the regulations about the difference between retail online ordering and delivery versus a home delivery system implemented by a State Agency (i.e., the type of delivery system Vermont employed prior to the implementation of EBT).</p>	<p>The regulations should distinguish between a state-procured home distribution food system and a retail-based home delivery option.</p>

Vendor Authorization		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Vendor Authorization (7 CFR 246.12(g)(1), (h)(1)(i)): State Agency must authorize an appropriate number of vendors. Agreements must be signed by a representative with legal authority and specify all vendors covered by the agreement. Agreements last no more than three years.</p>	<p>Virtual and some hybrid vendors are likely to cross State borders, causing confusion about which State is responsible for authorizing and monitoring the vendor. Especially for vendor models of a certain scale, this could present administrative barriers to building national online purchasing solutions.</p> <p>The introduction of virtual and hybrid vendors will increase monitoring responsibilities. To address burden on State Agencies, FNS, and retailers, vendor authorizations should be increased to five years, with appropriate safeguards in place to uphold existing regulations and regular monitoring for compliance.</p>	<p>Without disrupting existing State vendor authorization protocols, FNS should explore establishing an option for national authorization and monitoring of virtual vendors and virtual platforms for hybrid vendors. With baseline authorization at the FNS level, States can opt-in to authorizing the virtual platform for participants in their State while assuming monitoring obligations for vendor sites that fulfill orders for participants in their State.</p> <p>State Agencies may collaborate to monitor vendor sites, including fulfillment centers, for the purpose of authorization in multiple States. Virtual vendors or virtual platforms of hybrid vendors shall not fulfill orders out of a location that has not been monitored or approved per their authorization agreement, either through FNS or a State Agency.</p> <p>States preserve the ability to opt-out (with certain notice to the vendor), but final authorization remains vested at FNS. Vendor authorization periods should be extended to five years to reduce burden on State Agencies, FNS, and retailers.</p>
<p>Application Periods (7 CFR 246.12(g)(8), (h)(1)(i)): Vendors must reapply for authorization every three years. State Agencies may limit the periods during which applications can be accepted.</p>	<p>The introduction of virtual and hybrid vendors will increase monitoring responsibilities. To address burden on State Agencies, FNS, and retailers, vendor authorizations should be increased to five years with regulatory monitoring and compliance.</p>	<p>States may opt-in to Federally-authorized virtual vendors or virtual platforms of hybrid vendors at any time, even if application periods exist for physical vendors in their jurisdiction. Vendor authorization periods should be extended to five years (with regular monitoring and compliance) to reduce burden on State Agencies, FNS, and retailers.</p>

Vendor Authorization		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>On-Site Preauthorization Visit (7 CFR 246.12(g)(5)): State Agency must conduct an on-site visit prior to or at the time of a vendor’s initial authorization.</p>	<p>Virtual vendors and virtual platforms of hybrid vendors may use fulfillment centers or other channels to deliver supplemental foods outside of a physical store location. Before authorizing a virtual platform, State agencies should assess the vendor’s ability to fulfill orders in compliance with program rules, including the ability to transact benefits, handle substitutions within program parameters, and maintain safety of supplemental foods throughout the fulfillment process. In-person monitoring of vendor sites before authorization should apply in the virtual context, with ongoing access for monitoring purposes to ensure continued compliance.</p>	<p>Recommended Update: 7 CFR 246.12 (g)(5) On-site preauthorization visit. The State agency must conduct an on-site visit at a physical vendor location prior to or at the time of a vendor's initial authorization. For virtual vendors or the virtual platform of a hybrid vendor, the vendor shall provide relevant health, safety, and compliance information requested by the State agency and receive approval by the State before authorization. The State agency must evaluate all of the requested information provided by the vendor, including the ordering mechanism from initiation to order completion and ensuring the vendor is purchasing infant formula from an authorized infant formula supplier. If the vendor has sites with inventory (i.e., store location, fulfillment centers, etc.) within the State agency’s jurisdiction, the State must conduct an on-site visit to at least one vendor location before authorization. For vendor sites outside of the State agency’s jurisdiction, the State agency may still conduct an on-site visit or request another State agency to conduct an on-site visit before authorization. The State may approve or reject a vendor. The State must provide notice to the vendor of its determination.</p>

Vendor Authorization		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Farmer Authorizations (7 CFR 246.12(v)): State Agency may authorize farmers or farmers markets to redeem CVB, but may require individual authorizations for each farmer.</p>	<p>It is more cost effective for a farmer to participate as part of a farmers market than to have to support their own equipment for processing EBT transactions. Unless using new technology Mobile to Mobile App or Mobile to card</p>	<p>Recommend clarifying the regulations to explicitly allow for farmers markets to be authorized and redeem WIC CVB.</p> <p>Recommend Farmers and Markets have the ability to use multiple tender types.</p>

Vendor Management		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Competitive Pricing (7 CFR 246.12(g)(4)): State Agency must establish vendor peer group systems that distinguish competitive prices and allowable reimbursement levels.</p>	<p>Virtual platforms are authorized separately from physical store locations, and State agencies must place virtual platforms in peer groups. State agencies should be sensitive to significant price disparities between the physical and virtual options of a hybrid vendor.</p>	<p>Food prices for virtual vendors shall be competitive with their assigned peer group. State agencies should not be required to group virtual vendors separate from physical vendors, and guardrails should be established to ensure substantially similar pricing between the virtual platform and physical location of a hybrid vendor. Broader regulations should be drafted as virtual platforms are introduced into the WIC space, permitting USDA to strengthen rules with guidance as more information is available.</p>
<p>A-50 Incentives (7 CFR 246.12(g)(3)(iv)): A-50 stores cannot provide incentive items, including services greater than nominal value provided to the customer.</p>	<p>As written, delivery could be interpreted to be an incentive item and therefore prohibited.</p>	<p>Recommended Update: 7 CFR 246.12(g)(3)(iv)(D) The State agency shall not consider delivery of supplemental foods as an incentive item. State agencies may approve home delivery options for above-50-vendors.</p>

Vendor Management		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Vendor Training (7 CFR 246.12(h)(3)(xii), (xiii). (i)(1-4)): Vendor must inform and train staff on program requirements. At least one representative of vendor must participate in training annually.</p>	<p>Not all transactions will involve cashiers; additional personnel such as fulfillment personnel may require training.</p> <p>Virtual vendors operating across State lines must ensure that State-based operations are informed of State-specific vendor monitoring requirements.</p>	<p>(xiii) <i>Vendor training of staff.</i> The vendor must inform and train cashiers and other staffappropriate personnel on program requirements.</p> <p>(1) <i>Vendor training—General Requirements.</i> The State agency must provide training annually to at least one representative of each vendor. For virtual platforms that could be authorized nationally, each State agency that has opted-in to the authorization must provide annual training to a representative of the vendor’s operations in that State. Prior to or at the time of a vendor’s initial authorization, and at least once every three years thereafter, the training must be in an interactive format that includes [. . .]</p>

Vendor Management		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Vendor Monitoring (7 CFR 246.12(j)): State Agency must design a monitoring system, including routine visits and compliance investigations of all high-risk vendors and a minimum of 5% of authorized vendors.</p>	<p>Introducing virtual platforms requires monitoring of all vendor sites involved in fulfillment of the order. Authorization agreements should indicate all vendor sites located in fulfillment, providing hybrid vendors the option to limit fulfillment to physical store locations. State agencies may coordinate monitoring activities of both a physical store location and a virtual platform.</p>	<p>Monitoring requirements shall not change for physical locations. For virtual platforms operated by both virtual and hybrid vendors, the State agency is responsible for conducting virtual compliance buys for State-authorized and opt-in Federally-authorized vendors in their State. Notice of noncompliance must be immediately presented to FNS. FNS shall also conduct virtual compliance buys for all Federally-authorized vendors each year and develop criteria for identifying high-risk virtual vendors and appropriate corrective actions. On-site monitoring visits can be conducted at any location in the fulfillment process as defined in the authorization agreement. In addition to compliance buys, inventory audits and other monitoring activities shall be conducted by the States consistent with requirements for physical store locations.</p>

Vendor Management		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Vendor Sanctions (7 CFR 246.12(l)(1)(iii), (iv)): State Agencies may disqualify vendors permanently, for six years, for three years, and for one year based on differing criteria.</p>	<p>Existing sanctions can apply in virtual settings and should be clarified to apply. Sanctions deter inappropriate vendor activity, namely failing to provide foods redeemed online and providing inappropriate substitutions both (1) without participant consent and (2) beyond federal nutrition standards. FNS would be responsible for determining sanctions for Federally-authorized vendors, and may limit the sanction to specific jurisdictions.</p>	<p>(iii) <i>Three year disqualification</i> [. . .] (G) A pattern of charging for supplemental food on a virtual platform that is not received by the participant; (H) A pattern of providing substitutions for supplemental foods ordered on a virtual platform that are not aligned with the food packages defined in section 246.10(e); (j) A pattern of fulfilling orders from a vendor site that is not approved by the WIC State Agency or FNS; (k) A pattern of setting prices that are not substantially similar on a virtual platform and physical store location that are authorized by the same corporate entity; [. . .] (iv) <i>One-year disqualification</i>. [. . .] (C) A pattern of providing substitutions for supplemental foods ordered on a virtual platform without notice and receiving consent from the participant.</p>

Vendor Management		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Infant Formula Wholesalers (7 CFR 246.12(g)(10)): The State Agency must provide a list in writing or by other effective means to all authorized WIC retail vendors of the names and addresses of infant formula wholesalers, distributors, and retailers licensed in the State in accordance with State law (including regulations), and infant formula manufacturers registered with the Food and Drug Administration (FDA) that provide infant formula, on at least an annual basis. States may permit purchase from sources on another State’s list.</p>	<p>State agencies will need to ensure that virtual platforms are held to the same standards as physical store locations in the purchase of infant formula from an authorized wholesaler, distributor, or manufacturer, as required in federal law.</p>	<p>USDA should create a list of authorized infant formula suppliers (distributors, wholesalers, and manufacturers) for online ordering of infant formula and an application process for virtual infant formula suppliers to be listed on the USDA authorized infant formula supplier list. All authorized retailers shall be required to purchase infant formula from an authorized infant formula supplier. To conduct vendor audits, if an authorized infant formula supplier list is established by the USDA and used by the retailer, USDA shall have authority consistent with the state authority to audit vendor sales and require proof of purchase from an authorized infant formula supplier. If the State Agency-authorized infant formula supplier list is used, the State would continue to conduct vendor audits as appropriate including audits of sales and required proof of purchase from the USDA authorized infant formula supplier.</p>
<p>State Plan Requirements (7 CFR 246.4(a)(14)): State Agencies are required to report policies to FNS on vendor management priorities each year.</p>	<p>The State Plan is a centralized document that outlines State policies, receives input from community stakeholders, and is reviewed by FNS. The State Plan could be a useful place to articulate requirements for vendor authorization of virtual platforms and facilitate efforts to streamline authorization at a nationwide level.</p>	<p>The State Plan requirements should be modified to reflect the introduction of virtual platforms, including descriptions of vendor monitoring policies for both in-state and out-of-state vendor sites for virtual platforms.</p>

Vendor Management		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Routine Collection of Shelf Prices (7 CFR 246.12(f)(4)(ii)(B)): State agency must collect vendor shelf prices at least every six months.</p>	<p>With daily EBT redemption data, State Agencies have vendor shelf price data that is more timely and accurate than shelf price surveys. State Agencies may want to perform shelf price surveys to spot check but should be able to use their EBT data to perform the required analysis. Shelf price data would still be required from applicants as part of the authorization process.</p>	<p>Strike section (original text below):</p> <p>(B) Routine collection of vendor shelf prices at least every six months following authorization to monitor vendor compliance with paragraphs (g)(4)(i)(C), (g)(4)(ii)(C), and (g)(4)(iii) of this section and to ensure State agency policies and procedures dependent on shelf price data are efficient and effective. FNS may grant an exemption from this shelf price collection requirement if the State agency demonstrates to FNSs' satisfaction that an alternative methodology for monitoring vendor compliance with paragraphs (g)(4)(i)(C), (g)(4)(ii)(C), and (g)(4)(iii) of this section is efficient and effective and other State agency policies and procedures are not dependent on frequent collection of shelf price data. Such exemption would remain in effect until the State agency no longer meets the conditions on which the exemption was based, until FNS revokes the exemption, or for three years, whichever occurs first;</p>

Vendor Management		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Recordkeeping (7 CFR 246.12(h)(3)(xvi)): Vendor must maintain inventory and food instrument records and make records available to State Agency.</p>	<p>As transaction technologies adapt, retailers may not physically hold food instruments. This section should be updated to reflect transaction records and maintain the current requirement that relevant records be provided for inspection and audit. Updated language should be applied equally to physical, hybrid, and virtual vendors.</p>	<p>(xvi) <i>Recordkeeping</i>. The vendor must maintain inventory records used for Federal tax reporting purposes, transaction records, and other records the State agency may require for the period of time specified by the State agency in the vendor agreement. Upon request, the vendor must make available to representatives of the State agency, the Department, and the Comptroller General of the United States, at any reasonable time and place for inspection and audit, all food instruments and cash value vouchers in the vendor's possession and all program-related records.</p>
<p>EBT minimum lane coverage (7 CFR 246.12(h)(3)(xxvii), (z)(2)): Vendors must deploy a certain number of point-of-sale terminals based on sales.</p>	<p>As transaction technologies adapt, broader terminology should be employed to permit further innovation.</p>	<p>(xxvii) EBT <i>Minimum lane coverage</i>. Point-of Sale (POS) terminals used to support the WIC Program Technology equipped to conduct WIC transactions shall be deployed in accordance with the minimum lane coverage provisions of §246.12(z)(2). The State agency may remove excess terminals reduce minimum lanes for an individual vendor if actual redemption activity warrants a reduction consistent with the redemption levels outlined in §246.12(z)(2)(i) and (z)(2)(ii).</p>

Vendor Management		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>EBT third-party processing costs and fees (7 CFR 246.12(h)(3)(xxviii), (xxix), (xxx), (aa)(3)): Vendor shall not charge any third-party commercial processing costs or fees to the State Agency.</p>	<p>As transaction technologies adapt, broader terminology should be employed to permit further innovation.</p>	<p>(xxviii) EBT <i>Third-party processing costs and fees</i>. The vendor shall not charge to the State agency any third-party commercial processing costs and fees incurred by the vendor from transaction technologies, including EBT multi-function equipment. Commercial transaction processing costs and fees imposed by a third-party processor that the vendor elects to use to connect to the EBT system of the State shall be borne by the vendor.</p> <p>(xxix) EBT <i>interchange fees</i>. The State agency shall not pay or reimburse the vendor for interchange fees related to WIC EBT transactions.</p>

<i>Transaction Processing</i>		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Fees (7 CFR 246.12(c), (h)(3)(x)): Participants must receive supplemental foods free of charge.</p>	<p>As written this provision could be interpreted that a WIC participant cannot be charged any fee associated with a purchase, including a delivery that they pay for with a separate tender.</p>	<p>Recommended Update: 7 CFR 246.12 (c) No charge for authorized supplemental foods. The State agency must ensure that participants receive their authorized supplemental foods free of charge <i>with the exception of delivery fees that may be charged for the delivery of a purchase. Delivery fees shall not be paid with WIC food funds, but may be paid with another form of tender. Delivery fees charged to WIC participants shall be less than or consistent with fees charged to non-WIC customers, and a vendor may waive fees charged to WIC customers. Only one delivery fee may be applied per order even if multiple tenders are used. Information about delivery fees shall be transparent and made available to the WIC participant so that the participant is aware of the cost of delivery and if there is a minimum purchase amount for free delivery. Delivery fee information shall be provided as early as possible during the shopping experience but no later than selection of “delivery” as the method of receipt of food benefits.</i></p>

<i>Transaction Processing</i>		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Equal Treatment (7 CFR 246.12(h)(3)(iii), (v)(1)(ix)): Vendor must offer participants the same courtesies offered to other customers.</p>	<p>Regulations that require “same courtesies” or equal treatment are intended to assure that vendors do not penalize, mistreat, or discriminate against program participants. Although a logical interpretation would allow for vendor treatment that demonstrates preference for program participants, clearer language would ensure that vendors are empowered to waive fees or otherwise support program participants in redeeming benefits.</p>	<p><i>Treatment of participants, parents/caretakers, and proxies.</i> The vendor must offer program participants, parents or caretakers of infant or child participants, and proxies the same courtesies offered to other customers. Vendors may demonstrate preferential treatment for program participants (i.e., waiving delivery fees).</p>
<p>Balance Inquiry (7 CFR 246.12(f)(2)(i), (x)(2)(i)): Food instrument must display the authorized supplemental foods.</p>	<p>With the introduction of EBT, participants have struggled to identify their existing balance. Shopping apps, participant portals, and other innovations are streamlining that experience, but a balance inquiry should be integrated into any online shopping experience.</p>	<p><i>Electronic benefits.</i> Each electronic benefit must contain the following information:</p> <p>(i) <i>Authorized supplemental foods.</i> The supplemental foods authorized by food category, subcategory and benefit quantity, to include the cash-value benefit. This balance must be available to the participant before redemption of benefits in retail transactions.</p>

<i>Transaction Processing</i>		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Grace Period (7 CFR 246.12(f)(2)(iv), (x)(2)(iii)): Benefits must have a last date of use set at a minimum of 30 days.</p>	<p>With online transactions, there could be a lag time between the time that a WIC account holder selects their food and the time that they take possession of the food. The requirement referenced above is not clear as to whether the time of transaction is the time of the order or the time of receipt of the food. Further, if a substitution occurs (e.g., if the WIC participant ordered one food item but it was out of stock, so it was replaced with another authorized food item), the original purchase price (charged in the online transaction) may not align with authorized supplemental food items actually provided. This price would need to be adjusted.</p>	<p>To support online ordering/shopping and provide time for WIC participants to pick up items or schedule delivery, the Task Force recommends that a grace period be allowed so that a transactions initiated prior to benefit expiration are able to be completed after expiration.</p> <p>Recommended Update: For benefits transacted in a physical vendor location, WIC benefits must be transacted within the first and last date of use. When a transaction is performed through a virtual shopping platform, the transaction must be initiated (authorized) prior to the expiration of benefits and may be completed (cleared) up to three days after the expiration of benefits to allow time for the customer to schedule pick up or delivery of items.</p>
<p>Split-Tender Transactions (7 CFR 246.12(f)(4), (h)(3)(xi)): Split-tender transactions are required only to pay difference where CVB exceeds.</p>	<p>Current regulations only anticipate a need for split-tender transactions for when the CVB is exhausted, but even in-person transactions could include greater quantities than what has been issued. Both physical and virtual transactions should provide participants with the opportunity to complete a split-tender transaction (ideally both SNAP and credit/debit/cash), while providing safeguards for participants to remove items from their cart before purchase.</p>	<p><i>Split tender for cash-value benefits vouchers.</i> The vendor must allow the participant, authorized representative or proxy to pay the difference when a fruit and vegetable purchase exceeds the value of the cash-value vouchers benefit (also known as a split tender transaction). Vendors operating virtual platforms must ensure that participants can conduct split tender transactions, with adequate notice to participants to cancel items in excess of issued benefits.</p>

<i>Transaction Processing</i>		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Refunds (7 CFR 246.12(h)(3)(ii)): Vendor may only provide authorized foods listed on the food instrument. Vendor may not provide refunds or permit exchanges.</p>	<p>Account holders cannot exchange their WIC food for non-WIC items. This requirement was written when there were paper food instruments, and it was not possible to return benefits back to the account holder so that they could purchase a suitable replacement food. With EBT, it is now possible and easy to restore benefits to an account holder’s account. In addition, a key component of this requirement is the use of the word, “obtained”. This implies that the prohibition applies after the account holder has taken receipt of their food. This means that it may be possible (depending on the technical details of the transaction process) to restore benefits for foods ordered but not yet “obtained” by the account holder.</p>	<p>The Task Force recommends that refunds should be allowed to address issues that may occur in the fulfilment of online orders. The refund should allow for the crediting of the value/quantity of individual items within the order. Refunds could remain limited to only online orders/purchases but could be expanded to physical stores.</p> <p>Recommended Update: (A) <i>For purchase transactions initiated and completed in physical locations</i>, the vendor may not provide unauthorized food items, nonfood items, cash, or credit (including rain checks) in exchange for food instruments or cash-value vouchers. The vendor may not provide refunds or permit exchanges for authorized supplemental foods obtained with food instruments or cash-value vouchers, except for exchanges of an identical authorized supplemental food item when the original authorized supplemental food item is defective, spoiled, or has exceeded its “sell by,” “best if used by,” or other date limiting the sale or use of the food item. An identical authorized supplemental food item means the exact brand and size as the original authorized supplemental food item obtained and returned by the participant. <i>For transactions performed in a virtual platform, the preceding requirements associated with physical locations apply except a refund that allows for item quantities to be credited back to a participant account may be used to address issues within an order or errors in fulfilment.</i></p>

<i>Transaction Processing</i>		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Signature (7 CFR 246.12(h)(3)(vi), (f)(2)(vii): Vendor must ensure participant or proxy signs the food instrument/enters PIN in presence of a cashier.</p>	<p>The requirement of cashier presence at the time of the transaction is a barrier to online transactions. The regulations are ambiguous as to the definition of cashier, whether EBT Personal Identification Number (PIN) entry must be in the presence of a cashier, or how cashiers oversee a self-checkout transaction. With the transition to electronic transactions, cashier oversight is a superfluous program integrity measure that complicates online transactions and can be readily replaced by electronic authentication.</p> <p>The regulation also requires vendors to ensure that participants either sign or enter a PIN number to authenticate the transaction. While authentication is an important program integrity measure, broader language that aligns with industry standards for authentication of transactions could incorporate industry accepted multi factor authentication options and help the program adapt to rapidly evolving technologies.</p>	<p>The Task Force recommends:</p> <ul style="list-style-type: none"> • Eliminating cashier presence and physical signature requirements • Updating reference to PIN usage as a form of signature to terminology that would allow for other methods of authentication that may be available as technology evolves. <p>Recommended Language: (7 CFR 246.12(h)(3)(vi): Signature on food instruments and cash-value vouchers. <i>WIC Transaction Authentication</i> For printed food instruments and cash-value vouchers, the vendor must ensure the participant, parent or caretaker of an infant or child participant, or proxy signs the food instrument or cash-value voucher in the presence of the cashier. In EBT or other electronic systems, a Personal Identification Number (PIN) may be used in lieu of a signature. <i>WIC transactions must be authenticated* using methods consistent with commercial practice (e.g., PIN or password). The Secretary may approve additional methods.</i></p> <p>*See Table 1 for proposed definition of authentication.</p>

Transaction Processing		
Current Regulation Description	Impact on Future Innovation	Task Force Recommendation
<p>Benefits Receipt (7 CFR 246.12(r)(2), (4)): Participants or proxies must sign for receipt of food instruments at least every three months.</p>	<p>In-person pickup requirements for issued benefits are a relic of the paper voucher regime, with COVID-19 waiver authorities demonstrating that State and local WIC providers are equipped to remotely issue EBT benefits. Signature requirements – especially in-person signatures – should be phased out to recognize the new technologies available in WIC.</p>	<p>Strike both sections.</p>
<p>Benefits Issuance (7 CFR 246.12(r)(5)): Participants may only receive a maximum of three months of benefits at any one time.</p>	<p>During the pandemic, offline EBT states were permitted the opportunity to issue up to four months of benefits. To minimize in-person interactions, a higher benefit issuance – particularly for offline EBT states – would be helpful.</p>	<p>(5) <i>Maximum issuance of food instruments and cash-value voucher.</i> Ensure that no more than a sixthree-month supply of food instruments and cash-value vouchers or a one-month supply of authorized supplemental foods is issued at any one time to any participant, parent or caretaker of an infant or child participant, or proxy.</p>
<p>Vendor Identification (7 CFR 246.12(f)(3), (x)(3)): Food instrument must identify the vendor that is claiming reimbursement.</p>	<p>Introduction of virtual platforms, including virtual platforms authorized at the FNS level, will require uniform standards for vendor identification. Vendor identification should not be limited to paper vouchers or EBT but broad enough to encompass additional technologies.</p>	<p><i>Vendor identification.</i> The State agency shall ensure each EBT purchase submitted for electronic payment is matched to an authorized vendor, farmer, or farmers' market prior to authorizing payment. Each vendor operated by a single business entity must be identified separately.</p>

Table 3: Proposed Impacts of New Vendor Forms in WIC Program Management

The following table provides an overview and comparison of the proposed vendor types.

Vendor Categories	Physical Vendors	Virtual Vendors	Hybrid Vendors
Description	<p>All transactions are initiated and completed onsite at a physical location</p> <p>Foods are selected and obtained by the participant from the vendor’s physical location</p> <p>Includes mobile vendors that may not have a fixed operating location</p>	<p>Vendors that do not have a physical location</p> <p>Transactions are initiated and completed through a website, mobile app, or other technology</p> <p>Food benefits are delivered to the participant or they may be picked up at a specified location that is not a physical vendor location (i.e., food warehouse, locker, or mobile vendor location)</p>	<p>A vendor that has a physical location and has a virtual shopping platform or employs a service that provides virtual shopping services</p> <p>Transactions may be initiated and completed at the physical store or through virtual location.</p> <p>Food benefits may be delivered to the participant or picked up at the physical location</p>
Authorization	<p>No change from current regulations except to include mobile vendors</p>	<p>Establish a nationwide authorization managed by FNS that reconciles differing State program requirements and accounts for the potential of fulfillment across State lines</p> <p>May still be authorized by State agencies on a State-by-State basis</p> <p>Recommend collaboration with SNAP for authorization activities.</p> <p>Recommend a FNS maintain a list of authorized virtual vendors, then SA can opt-in and authorize vendors</p> <p>Virtual vendors still have to meet all of the WIC vendor authorization requirements</p> <p>Requirements in vendor agreements for Virtual Vendors should be as consistent as possible across SAs and limit State addendums</p>	<p>No change from current regulations for the physical location</p> <p>Virtual platform does not require a separate authorization if retailer signs agreement limiting fulfillment to in-store</p> <p>Virtual platform requires a separate authorization if retailer is fulfilling from locations other than the authorized physical store (i.e., another store location, fulfillment centers, etc.).</p> <p>The State Agency shall review the virtual shopping site and ordering/purchasing process prior to authorization or prior to an existing physical vendor implementing virtual shopping</p>

Vendor Categories	Physical Vendors	Virtual Vendors	Hybrid Vendors
Peer Grouping	No change from current regulations except to include mobile vendors	State Agencies may assign Virtual Vendors to peer groups with Physical or Hybrid Vendor or they may assign them to a separate Virtual Vendor peer group	Peer grouping based on physical location; however, the State Agency may consider the impact of the virtual platform on the peer grouping assignment and/or require the virtual platform to be grouped separately from the physical store location
Pricing	No change from current regulations except to include mobile vendors	Food prices shall be competitive with the assigned peer group	Prices must be substantially similar between the physical store and virtual platform
Monitoring	No change from current regulations except to include mobile vendors	Virtual compliance buys. On-site visits to fulfillment centers. Inventory audits to ensure f health, safety, and compliance.	No change from current regulations for physical locations Virtual compliance buys and inventory audits for virtual shopping platforms.

Section 5 Additional Considerations

In the previous sections, the recommendations report has focused on the specific areas of the ordering and purchasing process and the regulations impacted by the modernization of WIC benefit delivery. In our deliberations, the Task Force also identified a number of other areas that need to be addressed as FNS plans for the authorization of a process for online ordering/purchasing and other benefit delivery modernization efforts.

Funding to Support Benefit Delivery Modernization

Description/Impact: Effective implementation of online shopping options will require significant modification to State WIC Management Information Systems, processor systems, and retailer systems. Since many WIC State Agencies operate in partnerships to facilitate administration of MIS and EBT systems, implementation costs may exceed the available technology funding for any one WIC State Agency. WIC State Agencies will also incur additional costs to manage technology projects and conduct outreach to inform participants and retailers of systems changes.

Recommendations: Congress should authorize an additional \$75 million in additional funding, until expended, for WIC State Agencies to develop and adapt MIS platforms, EBT processing systems, and retailer platforms to scale up online shopping solutions by October 1, 2025.

Regulation Waivers During the Transitional Period

Description/Impact: As State agencies plan for the implementation of online ordering and purchasing, there are currently regulations that prohibit activities that are key components to these transactions. In addition, as individual retailers opt in to provide an online shopping option for redemption of WIC food benefits, specific implementation guidelines are needed to transition to or establish an online shopping option. Transitional compliance allowances to assure state agencies and retailers are or remain in compliance with applicable regulations during implementation are needed.

Recommendation: The retail landscape has changed while the regulations have remained unchanged. To accommodate the transition to or addition of an online shopping solution for WIC food benefit redemption, USDA should as needed utilize waiver authority under the American Rescue Plan Act to facilitate systems transitions consistent with regulatory changes being evaluated in the forthcoming rulemaking process. USDA should consider waivers in the following areas:

- Traditional definition of vendor that includes a single, fixed location.
- Cashier presence for WIC transactions.
- State authorization of WIC vendors. Allowing FNS to establish a Federal authorization for vendors operating in multiple states.
- Onsite preauthorization visits for virtual vendors. A limited waiver should clarify that on-site visits to an in-store vendor site responsible for fulfilling the order is appropriate for preauthorization purposes.
- Current limitation of uniform food delivery systems and that each food delivery system be procedurally uniform excluding multiple electronic payment types.

- Vendor selection criteria. Modify vendor authorization to include criteria/guidance for online only WIC vendors
- Current peer group structure. Expand to include option for virtual vendors to be considered as a separate peer group, regardless of geographical location
- Allow refunds or exchanges for online shopping platform purchases in the case of damaged or expired foods included in an order.
- Allow for the payment of delivery fees with non-WIC tender type
- Allow for a grace period for the expiration of benefits in order for orders to be fulfilled when orders are made during the final days of benefit availability

Ongoing Advisory Workgroup to Provide Input and Feedback to FNS

Description/Impact: As online ordering and benefit delivery modernization moves forward, FNS will need to update regulations, develop standards, and provide guidance. Input or feedback from industry and state agencies may be needed to accomplish these activities.

Recommendation: An ongoing work group should be convened that includes a cross section of industry and state agency advisors that can provide programmatic, functional, and technical assistance to FNS as they make critical decisions impacting how online ordering and purchasing will be accomplished. The structure of the group should be similar of size, experience, and knowledge as the members of the Task Force on Supplemental Food Delivery but does not have to be the same members.

Nationwide Authorization of Virtual Platforms

Description/Impact: Authorized virtual platforms are likely to cross State lines and require a new regulatory regime for the purposes of authorization and monitoring. Virtual platforms can be operated by a virtual vendor or a hybrid vendor, which also operates physical store location(s). Although States should retain the option to individually authorize virtual platforms, a new option for FNS-level authorization should be considered that streamlines the authorization process across all 89 WIC State Agencies and scales up access to virtual platforms as swiftly as possible. The FNS-level authorization should not operate autonomously from State policies or systems, but instead create a framework to simplify State-level authorizations through an opt-in that reduces or eliminates additional State-imposed criteria.

Recommendations: FNS should develop transparent vendor authorization criteria for virtual platforms that satisfy existing State vendor policies. When a vendor seeks authorization at the federal level, they must identify all applicable vendor sites that would be involved in fulfilling a WIC order and provide relevant health, safety, and compliance information. State agencies seeking to opt-in to the authorization would assume responsibility for any on-site monitoring of vendor sites requested by FNS, and may coordinate with additional WIC State Agencies to conduct preauthorization visits. Federally authorized virtual platforms must meet the Federal minimum stock requirements.

Once authorized at the Federal level, States may opt-in to the authorization before participants can access the platform. The State opt-in process involves testing of the virtual platform to ensure that transaction systems are interoperable with the State MIS. Once a State has fully opted-in, the State assumes ongoing monitoring responsibility for vendor sites within their geographic jurisdiction *as well as* vendor sites that fulfill orders delivered within their geographic jurisdiction. States may coordinate and

are encouraged to share monitoring information with other State agencies to reduce duplicative monitoring.

States may withdraw from a nationwide authorization upon notice to the retailer and FNS. States must communicate any findings from routine monitoring/auditing activities to FNS and may make recommendations for vendor sanctions. FNS is responsible for administering vendor sanctions for Federally authorized vendor sanctions and may limit sanctions to a specific vendor site (i.e., a single fulfillment center) or specific geographic jurisdiction.

Solutions for Small Vendors

Description/Impact: Compared to larger chain vendors, small vendors tend to have less sophisticated retail systems supporting their operations and less resources to support expanded functions like online ordering and purchasing. As an example of the challenges with small vendors' systems, the State of New Mexico has implemented online ordering with some of their small vendors using a third-party platform. This project has revealed that small retailers often do not have automated inventory management systems that account for what is/is not on the shelf, and pricing may/may not be automated. Therefore, when an online storefront is created for a small retailer, that store likely is not integrating with the retailer inventory system (if s/he has one) and may not have pricing that aligns with what is on the shelf. The result is that items may appear as available to the participant when they really are not and pricing might be inconsistent between what is noted online and what is the actual price in the store. This causes consumer confusion and hinders adoption. These factors contribute to as many as 25% of orders abandoned at pickup (order placed, but not picked up).

Many of the smaller retailers that participate in the WIC Program serve critical populations often in rural communities where they provide essential participant access to WIC foods. As benefit delivery is modernized, these retailers should not be left behind. Additional support and consideration will need to be made to ensure that they are able to participate in online ordering and purchasing for the WIC Program and maintain the integrity and quality of the WIC program and safety of foods delivered.

Recommendations: The Task Force recommends actionable direction to FNS regarding what is needed to transact WIC online in the small/independent retail community to include:

- Standardizing requirements for POS equipment vendors, software providers, wholesalers, and other relevant parties in order to consistently provide outputs based on approved product list (APL) files that seamlessly integrate with online storefront providers.
- Working closely with national retailers to leverage already developed solutions that small vendors can adopt without having to invest in system design.
- Create a government funded plug and play standalone solution for commonly available POS system(s) and allow independents to utilize without cost to the vendor.
- Provide grant funding to provide technical support as needed to ensure participation by independent and regional grocers.

Competitive Pricing for Hybrid Vendors

Description/Impact: The introduction of new vendor forms requires clarity about peer group structures and maximum reimbursement levels. Most virtual platforms will be authorized independently and

sorted into peer groups based on Federal and/or State criteria. Certain hybrid vendors, which can attest to fulfilling orders exclusively from an authorized physical store location, may not necessitate separate authorization for their virtual platforms.

Recommendation: FNS should set broad regulations that encourage substantially similar pricing between virtual platforms and physical store locations operated by the same corporate entity. Hybrid vendors should not be required to maintain the exact same pricing, to afford retailers autonomy to set in-store or online-only promotions while avoiding complex monitoring. FNS should continue to monitor the impacts of virtual platforms on peer group structures and issue supplemental guidance in the near-term to inform State management of competitive pricing.

Minimum Stock

Description/Impact: State agencies maintain minimum stock requirements for vendor authorization that seek to ensure physical store locations can provide a variety of supplemental foods for redemption. Minimum stock policies were often adopted in the era of paper vouchers and may warrant revision in light of technological advances such as EBT; however, minimum stock policies are demonstrated to have an impact on retailer behaviors, including increasing the availability of fresh produce in low-income neighborhoods after the 2009 food package changes. The introduction of virtual platforms, including those authorized at the Federal level, creates a new opportunity to revisit minimum stock policies.

Recommendation: The Federal minimum stock policy remains relevant, ensuring that WIC-authorized vendors can provide two forms of fruits, two forms of vegetables, and one form of whole grain cereal. WIC should draw lines to prevent fragmentation of the virtual market and continue to authorize retail platforms that address the wide range of WIC participant needs. States may continue to require additional minimum stock for State-authorized vendors, but cannot require Federally-authorized vendors to stock items beyond the Federal minimums.

Non-Traditional Vendors of Exempt Infant Formula and WIC-Eligible Nutritionals

Description/Impact: Federal law permits State agencies to exempt certain vendors from competitive price criteria and allowable reimbursement levels, including pharmacy vendors that supply only exempt infant formula or medical foods eligible under the program (42 U.S.C. 1786(h)(11)(D)(i)). Pharmacy vendors may be standalone entities or co-located with a physical store location that is an authorized WIC vendor.

Recommendation: USDA should assess the impact of virtual platforms on access to exempt infant formula and WIC-eligible nutritionals and contemplate whether additional vendors would be appropriate in a virtual context to serve the needs of WIC participants with Food Package III. Recognizing that virtual platforms encouraged by this report are rooted in retail models, USDA should evaluate whether statutory revisions to permit additional forms of specific vendors beyond pharmacies would be beneficial to the participant experience in unique circumstances.

Ensuring Infant Formula Safety and Quality

Description/Impact: As WIC online ordering and delivery moves forward, it is critical that systems are in place to ensure the safety and quality of WIC infant formula, including replicating program compliance mechanisms for a virtual environment and supporting the contracting/rebate process.

Recommendations:

- There should be no substitutions allowed by the vendor or the participant for any WIC-contracted infant formula or any WIC-exempt infant formula.
- For all vendors that have a virtual component, practices for purchasing infant formula from authorized manufacturers and distributors, preventing the substitution of infant formula and delivery of expired/damaged infant formula, properly disposing of all infant formula returns, verifying benefits have been received by program participants prior to triggering any requests to the State for payment reimbursement, and not submitting any returned or refunded infant formula for reimbursement and subsequent invoicing by the State (for rebate from the contracted manufacturer) should be documented and regularly verified.
- For all vendors that have a virtual component, incorporate compliance mechanisms (similar to in-person vendors) to monitor compliance (e.g., designating “high risk” vendors, conducting prescribed audits and verifying participant identity) , and ensuring transactions are properly completed).
- If the wrong (i.e., non-contract) infant formula is provided but the State has initiated reimbursement to the retailer and triggered a charge and subsequent rebate for the contract formula, there must be a system for the State to reverse any rebates for returned infant formula.

Development of Standards and Operating Rules Specific to Online Ordering and Purchasing

Description/Impact: The introduction of online ordering and purchasing will introduce new technical processes, procedures, and data elements into the existing EBT transaction processing environment. If these implementations are not done in a standardized and consistent way, it could result in multiple variations of online ordering and purchasing that will be both costly and confusing.

Currently, there are four technical documents that guide state agencies and industry all of which will be impacted by online ordering and purchasing. These documents are:

- X9.93-1-2014 Financial transaction messages — Electronic Benefits Transfer (EBT) — Part 1: Messages and Part 2: Files.
- WIC EBT Technical Implementation Guide 2018 Version.
- WIC EBT Operating Rules September 2014 Version.
- WIC Universal MIS–EBT Interface (WUMEI) Functional Requirements Specification 2015 Version.

At this time, online ordering concepts are not addressed in these documents and it is likely that updates will be required to all four with the implementation of online ordering and purchasing. Depending on the approach taken, it is possible that additional standards documents specific to online ordering and purchasing may be required.

Recommendation: To avoid costly and duplicative development, online ordering and purchasing should be implemented in a consistent way across all state agencies. It is recommended that:

- Early online ordering and purchasing projects work together across projects, state agencies, EBT processors, and retailers to maintain standard concepts to ensure that divergent approaches are not implemented.
- As the initial projects move forward, information should be gathered to determine the areas of the standards documents that require changes and additional content and areas where there are potential gaps that could impact the integrity and quality of the WIC program and safety of foods delivered.
- A work group of state agency and industry representatives that have experience with online ordering and purchasing as well as the standards documents should be convened with participation by FNS to develop the updates and additions to the standards to support online ordering, purchases, and auditing.

Processing Fees

Description/Impact: Vendors of all sizes invest significant resources to accept WIC and comply with all regulations. Investments include purchasing hardware and software, paying the merchant acquirer for processing and other costs. WIC State Agency contracted processors are sole service providers selected and paid by the respective WIC State Agency through a competitive bidding process. This structure works to ensure that all links in the WIC processing chain are invested and are not unfairly burdened with additional expenses. As WIC moves into new channels such as online and mobile, it is essential that vendors remain protected from any new or mandated processing fees or interchange. Increasing vendor costs to accept WIC could result in fewer vendors investing to accept WIC online or mobile payment. Even worse, it could result in vendors leaving the program creating greater access issues for participants.

Recommendation: The Task Force recommends that vendors maintain the statutory protections from interchange or any processing fees levied by a state contracted or subcontracted WIC provider. These protections will maintain the current balance that sole service providers and their subcontracted providers are paid under a competitively awarded contract and may require vendors to pay fees in order to process WIC transactions.

Above-50-Percent Vendor Reimbursements

Description/Impact: Several WIC State Agencies authorize A-50 vendors, which provide a well-documented service to WIC clients. A-50 vendors are distinguished from other physical vendors by statutory cost containment requirements, including separate peer groups and limitations on maximum reimbursements. Peer grouping is based on the recognition that stores of different types have different costs of doing business, but A-50s are typically limited to a statewide average price for reimbursements. The introduction of virtual platforms, which lack certain operational costs and may charge delivery fees, could further drive down the statewide average reimbursements and introduce another vendor form that is not comparable to existing A-50 physical vendors.

Recommendation: USDA should assess the impact of introducing virtual platforms and contemplate contingencies that sustain the viability of A-50 models, potentially include a statewide average calculation that excludes virtual platforms. FNS should also articulate clear guidance on whether virtual platforms can be designated as A-50 vendors and assess whether further changes are needed to ensure program integrity while supporting a full complement of authorized WIC vendors to meet participant needs.

Self-Checkout

Description/Impact: In WIC online ordering, self-checkout (SCO) lanes are not applicable to an online transaction.

Recommendation: Considerations for SCO lanes need not be included in the online ordering platform as long as the technology equipped to conduct online WIC transactions meets the minimum lane coverage provisions of §246.12(z)(2) and USDA will ensure program integrity measures that align with industry standards of authentication. As transaction technologies adapt, broader terminology for checkout lanes should be employed to allow for further innovation.

Telephone Ordering

Description/Impact: Telephone ordering for WIC purchases occurs now. If a vendor allows it, they can take an order from a participant and complete the purchase when the participant picks up the order in person. It requires the retailer to take the risk that the participant has the benefits to pay for the purchase and has selected the correct items as part of the order. It is understood that telephone ordering is more common in smaller communities where the retailer is familiar with the customer making the order. It is likely that telephone ordering for WIC items will decrease in use when WIC online ordering is launched. However, its continued use will not directly impact the ability to offer online ordering or the performance of online ordering.

Recommendation: If a retailer or store owner wishes to offer or continue to offer phone ordering for WIC customers, then this service should be allowed regardless of online ordering status. Payment will still be processed either in-store or curbside with a handheld card reader. Maintaining the ability to offer a phone ordering service will facilitate access to WIC for underserved populations with minimal technology access and for regions with poor broadband internet services so they can have a similar shopping experience to WIC online ordering.

Scan & Go Check Out

Description/Impact: New technologies are being implemented in brick-and-mortar stores that enable consumers to bypass a checkout register while shopping in-store. These technology solutions such as Scan & Go allow customers to actively scan items using a handheld scanner or mobile device or passively uses item tracking technology that doesn't require scanning by the customer. Customers may checkout at a specific checkpoint where they can select a payment method to check out via the store's online platform or app.

Recommendation: In Scan & Go stores, the store typically uses its online platform system to complete the checkout process. Once WIC is enabled as a tender option on a store's online platform, customers should automatically be able to use Scan & Go technology in-store and pay with WIC benefits. Allowing WIC customers to shop with Scan & Go would be impactful as more stores expand the use of this technology. As new transaction technologies emerge that bypass a register, the Task Force recommends that the checkout process utilize the store's online platform system that already includes the ability to use WIC as tender to enable WIC customers to shop in these stores.

Appendix A: Task Force Member & Organization Information

Information has been provided on the following pages about the Task Force member's background, their organizations, and their representation on the Task Force. As required under the Consolidated Appropriations Act, 2021, the members represent the following stakeholder groups:

- A. Retailers of supplemental foods.
- B. Representatives of State agencies.
- C. Representatives of Indian State agencies.
- D. Representatives of local agencies.
- E. Technology companies with experience maintaining the special supplemental nutrition program information systems and technology, including management information systems or electronic benefit transfer services.
- F. Manufacturers of supplemental foods, including infant formula.
- G. Participants in the special supplemental nutrition program from diverse locations.
- H. Other organizations that have experience with and knowledge of the special supplemental nutrition program.

Melinda Newport (Task Force Chair)

Director, Nutrition Services/Department of Health, Chickasaw Nation

Having been with the Chickasaw Nation for most of her career, **Melinda Newport** has administered over a dozen different USDA Food & Nutrition Services programs, demonstration projects and research initiatives. Excellence in nutrition programs has always been a priority for Melinda – as evidenced by receiving, on two occasions, one of the most distinguished awards USDA gives, the Secretary's Excellence Award. Melinda provided leadership to the first State Agency Model (SAM) MIS system consortium, SPIRIT, launched in 2008 and was an early adopter of online EBT technology in 2010. As former President of the National Association of WIC Directors and the National Association of Farmers' Market Nutrition Programs, she has long been actively involved in advocacy for nutrition programs.

The Chickasaw Nation is a federally recognized First American tribe located in south central Oklahoma. Presently, there are over 72,000 enrolled Chickasaw citizens, 58 percent of whom reside within Oklahoma. The Chickasaw Nation's treaty territory includes 7,648 square miles that encompass all or part of 13 Oklahoma counties. The Chickasaw Nation WIC Program is one of many tribal, state and federal nutrition programs that make up the Nutrition Services department, positioned within the Chickasaw Nation Department of Health. This structure allows the program a close partnership with all health, wellness and nutrition programs within the tribe, optimal integration of services and delivery of consistent nutrition education messages. The Chickasaw Nation Nutrition Services has a long-standing history of administering USDA FNS programs.

Task Force Representation: Melinda represents Group C, representatives of Indian State agencies.

Ellen Thompson (Task Force Vice Chair)

Maximus, Inc.

Ellen Thompson has more than 23 years of experience in the EBT industry and 18 years of experience working specifically with the WIC Program and WIC systems. She is considered an expert in EBT and WIC information systems technologies. Ellen has managed multiple EBT and WIC information system

projects, provided procurement support, quality assurance and technical assistance to numerous states, assisted states in system conversions, and managed system design and implementation efforts. In addition to her technical knowledge, she has a strong understanding of the benefit programs delivered by EBT. She was involved in the development of WIC EBT standards and is current involved in the maintenance and update of the WIC EBT technical standards documents as part of a USDA FNS project. Ellen is currently a Vice President at MAXIMUS where she leads a consulting practice focusing on EBT, WIC, and Integrated Eligibility Systems. She also serves as the Vice Chair for Rules and Practices on the eGovernment Payments Council.

Maximus, Inc. Since 1975, Maximus has operated under its founding mission of Helping Government Serve the People®, enabling citizens around the globe to successfully engage with their governments at all levels and across a variety of health and human services programs. Maximus delivers innovative business process management and technology solutions that contribute to improved outcomes for citizens and higher levels of productivity, accuracy, accountability, and efficiency of government-sponsored programs. With more than 30,000 employees worldwide, Maximus is a proud partner to government agencies in the United States and internationally. MAXIMUS has been recognized throughout the past twenty-five years for its continued contributions to the nationwide implementation of EBT technologies for both SNAP and WIC. Our staff of experts have provided EBT and/or information system consulting services to the majority of WIC State Agencies (states, territories, and tribal agencies) across the country. We have kept pace with the changing WIC EBT environment through our role in the development and maintenance of EBT standards, leadership in the eGovernment Payments Council, and participation with other national organizations.

Task Force Representation: Ellen represents Group H, other organizations that have experience with and knowledge of the special supplemental nutrition program.

Mary Anne Burghardt

North Carolina Department of Health and Human Services

Mary Anne serves as the State WIC Director in North Carolina. North Carolina WIC serves over 250,000 participants each month, making it the fifth largest WIC Program in the nation. She also serves on the National WIC Association Board of Directors as the Southeast Region State Director representative. She is a Registered Dietitian (RD) and a Licensed Dietitian/Nutritionist in North Carolina. Mary Anne leads a dynamic team of dedicated WIC employees at the State agency. The North Carolina team won the National Association of State Chief Information Officers (NASCIO) 2019 State IT Recognition Award in the category of Digital Government: Government to Citizen for the NC eWIC implementation project.

Task Force Representation: Mary Anne represents Group B, representatives of State agencies.

Brian Dittmeier

National WIC Association

Brian Dittmeier is the Senior Director of Public Policy for the National WIC Association. He manages the Association's advocacy strategy to advance public policy priorities, including efforts to secure WIC funding and ensure efficient program administration.

National WIC Association is the non-profit voice of the 12,000 public health nutrition service provider agencies and the 6.3 million mothers, babies, and young children served by WIC. NWA provides

education, guidance, and support to WIC staff, and drives innovation and advocacy to strengthen WIC as we work toward a nation of healthier families.

Task Force Representation: Brian represents Group H, other organizations that have experience with and knowledge of the special supplemental nutrition program.

Maria Caranfa
Kellogg's

Maria Caranfa is a Senior Wellbeing and Regulatory Business Partner for Kellogg Company. In this capacity, Maria leverages Kellogg's commitment to physical, emotional and societal wellbeing to embed wellbeing into its business to unlock growth for its brands and provide positive consumer impact.

Maria is inspired by the intrinsic power of food to bring health and joy to people's lives. She has built an incredible career as award winning Registered Dietitian Nutritionist in the food industry by showing passion and commitment to developing nutrition strategies, creating new foods, increasing nutrition information transparency, and communicating the benefits of food and nutrition. Maria made an impact at leading companies like Kellogg's, National Restaurant Association, Bloomin' Brands Inc., Mintel, and Barilla America Inc. Today's Dietitian named Maria one of its "TD10: Incredible RDNs Who Are Making a Difference" and the National Restaurant Association recognized her for "Outstanding Leadership" of its Nutrition Executive Study Group.

Maria also served as a board member of Healthy and Natural Chicagoland. She is a graduate of Purdue University with a Bachelor of Science in Dietetics and Nutrition, Fitness and Health Promotion. She completed her Dietetic Residency at Virginia Commonwealth University's School of Medicine.

Outside of work, Maria enjoys spending time with her family including her cat Lucky, practicing yoga, creating new recipes, drinking coffee, and catching the latest streaming mystery series.

The **Kellogg Company**, doing business as Kellogg's, is an American multinational food manufacturing company headquartered in Battle Creek, Michigan, United States. Kellogg's produces cereal and convenience foods, including crackers and toaster pastries and markets their products by several well known brands including Corn Flakes, Frosted Flakes, Pringles, Eggo, and Cheez-It. Kellogg's mission statement is "Nourishing families so they can flourish and thrive."

Task Force Representation: Maria represents Group F, manufacturers of supplemental foods, including infant formula.

Sarah Flores-Sievers
New Mexico Department of Health

Sarah Flores-Sievers has been the WIC and Farmers Market Director for the New Mexico Department of Health, Family Health Bureau since 2012. Prior to that, she was the Eight Northern Indian Pueblo WIC Director. Sarah had a crucial role in the creation and implementation of the MOSAIC "regional MIS/EBT solution" with New Mexico, Texas, Louisiana and the two Indian Tribal Origination (ITO's). She was selected and currently serves on the Governor's Hunger Task Force and is the current Chair on the National WIC Association (NWA.) She firmly believes that WIC families deserve everything that we are all entitled to and is why she continues to push the boundaries for equitable access to life-changing services, including advanced technology for improved services and education. Sarah knows it's vital that we strive to streamline our programs to simplify the shopping and application process and remove the

burden placed on our families and allowing us to serve more participants. She believes that we must think of the next generation to align with their expectations on technology, as they are our future. In October, Sarah will start a proof of concept mobile to mobile app solution for the WIC and Seniors Farmers Market Programs.

The **New Mexico WIC Program** serves an average of 38,000 participants/month and a total of 456,000 families a year at 41 permanent WIC offices and 26 satellite clinics. Nearly half of all infants born in New Mexico participate in WIC. In 2019, the Centers for Disease Control reported that obesity in NM toddlers declined by 3.7%, as a result of the updated changes in the WIC food package. New Mexico WIC was one of the first states in the nation to successfully implement "curbside" WIC operations in response to the COVID-19 pandemic. The transition to curbside WIC operations was made possible by waivers that Congress granted and swiftly working with Vexcel, our MIS vendor. Not one day of service was missed.

On March 8, 2021, NM WIC began offering online shopping to WIC participants in Southern New Mexico. This pilot project with 9 WIC authorized vendors will allow WIC participants to shop online and pick up their prepared order curbside. New Mexico will be the first in the nation to offer this statewide cost-effective shopping solution with the emphasis on small and midsized vendors.

Task Force Representation: Sarah represents Group B, representatives of State agencies.

Jennifer Hatcher & Hannah Walker
Food Marketing Institute

Jennifer Hatcher is the Chief Public Policy Officer for FMI - the Food Industry Association. Jennifer leads FMI's government relations team and has worked with FMI retailer, wholesaler and product supplier members on SNAP and WIC policy and operational issues for 23 years including working with FMI's Electronic Payment Systems Committee, FMI's SNAP Working Group and the FMI WIC Task Force to develop innovative policy approaches. Jennifer has testified before the U.S. House of Representatives Committee on Agriculture, Nutrition and Forestry on EBT issues and has served as a resource on a number of policy panels focused on SNAP and WIC issues.

FMI: As the food industry association, FMI works with and on behalf of the entire industry to advance a safer, healthier and more efficient consumer food supply chain. FMI brings together a wide range of members across the value chain — from retailers that sell to consumers, to producers that supply food and other products, as well as the wide variety of companies providing critical services — to amplify the collective work of the industry.

Task Force Representation: Jennifer and Hannah represented Group A, retailers of supplemental foods.

Kurt Helwig
Electronic Funds Transfer Association, eGovernment Payments Council

Kurt Helwig is widely recognized as a leader in the rapidly expanding e-payment/e-commerce field. As president and CEO of the Electronic Funds Transfer Association - whose members process 90% of all electronic payment transactions in the U.S. - he's led policy initiatives since 1995 that have significantly shaped the course of the industry.

Kurt is sought out as a subject matter expert by Members of Congress and staff, journalists and leaders in the Consumer Financial Protection Bureau (CFPB), U.S. Department of Treasury, Federal Reserve Board, General Accountability Office and the Department of Agriculture (FNS) on a variety of payment

systems issues. His knowledge is an invaluable resource to policy makers on critical subject matter areas such as mobile payments, faster payments/real-time settlement, prepaid cards, fraud and risk, ATM, POS and Electronic Benefits Transfer (EBT) services, data privacy/security issues, and General Data Protection Regulation (GDPR).

eGovernment Payments Council is an industry council within the Electronic Funds Transfer Association (EFTA) that focuses on the business, policy and operating issues involved in government electronic payment programs. The mission of the eGPC is to promote policy and business practices favorable to the expansion of government-driven electronic payment transactions and systems. The council is a public-private partnership consisting of state and federal entities, advocacy groups, and for-profits firms. The council is actively involved in shaping the future of EBT in terms of technology, operations, and influencing state and federal policy.

Task Force Representation: Kurt represents Group H, other organizations that have experience with and knowledge of the special supplemental nutrition program.

Cary Jeffers

Fidelity National Information Services

Cary Jeffers is the Director of Product for the Government Division at FIS and has more than 29 plus year in the Government Payment space which includes Supplemental Nutrition Assistance Program (SNAP formerly Food Stamps), Cash program including Temporary Assistance for Needy Families (TANF), Women Infants and Children (WIC), Child Care, Unemployment Insurance, Workman's Compensation, Prepaid technologies and other payment programs.

Cary's role as the Director or Product is to defines the market for the Government programs such as digital payments, Filtered Spend, eWIC, Website design, Prepaid payment programs, Mobile technologies, retailer integration that will continue to look for new ways to innovate and drive efficiencies and new products to the Government space.

Cary is involved with Standards Boards (X9) for both the SNAP and WIC specifications, a member of the EGPC/EFTA, WIC Technology workgroup, Prepaid Compliance Network, as well as associated with Payment Acquirer, Payment Networks, work group to implement the Online Purchase Pilot SNAP program, pandemic response, and various encryption technology work groups. Cary is a trusted industry advisor to USDA FNS. In 2015 Cary was awarded the industry Tim O'Connell Pioneer of the year award, for his contributions to the EBT industry.

FIS is the world's largest global provider with over 40 years as a leading Fin Tech company, dedicated to payments and banking technologies. With a long history deeply rooted in the financial services sector, FIS serves more than 20,000 institutions in over 100 countries. FIS delivers the most comprehensive range of solutions for the broadest range of financial markets and holds leadership positions in payment processing and banking solutions, providing software, services and outsourcing of the technology that drives financial institutions. Our motto is Advancing the way the world pays, banks and invests™

Task Force Representation: Cary represents Group E, Technology companies with experience maintaining the special supplemental nutrition program information systems and technology, including management information systems or electronic benefit transfer services.

Chuck Layosa**Inter-Tribal Council of Nevada**

Chuck Layosa is Director of Women Infant and Children program at the Inter-Tribal Council of Nevada since 2019. Serving all Nevada communities in need to include the 27 Native American tribal nations who call Nevada their home. I see first-hand how programs such as WIC benefit the development of children and its long-term effects on the communities where they are raised. Most of his career he has been in the private sector with a background in adult education having served many years in senior management for one of the largest private universities in the world as well as leadership experience in wholesale/Retail distribution and manufacturing. Chuck enjoys solving problems and this panel allows me to see how solutions are brought to bear in a very relevant and collaborative manner for the benefit of vulnerable demographics throughout the country.

Task Force Representation: Chuck represents Group C, representatives of Indian State agencies.

Angela Milroy**First Data Corporation/FISERV**

Angela Milroy: Angela (Angee) Milroy is Director of Product, Global Business Solutions, at Fiserv. She is responsible for development and implementation of Debit and EBT solutions. She led efforts in facilitating the acceptance of online Electronic Benefits Transfer (EBT) payments in support of the United States Department of Agriculture's (USDA) Supplemental Nutrition Assistance Program (SNAP) Online Purchasing Pilot. The program scaled rapidly in 2020 to allow millions of underserved Americans to buy groceries online for the first time.

Throughout her 25+ years at Fiserv/First Data, Angee has held a variety of positions. She started her career in Fraud Investigations, moving on to Account Management, Training and rising to her current position as a Product Director.

She is based in Omaha, NE.

Fiserv:

Task Force Representation: Angela represents group E, technology companies with experience maintaining the special supplemental nutrition program information systems and technology, including management information systems or electronic benefit transfer services.

Robert Rankin**Infant Nutrition Council of America**

Robert Rankin is the Executive Director of the Infant Nutrition Council of America (INCA). Robert has worked with the infant formula industry for over 16 years, during which time he has led INCA legislative, regulatory, and operational strategy including engaging with FNS on WIC issues.

INCA is the association representing manufacturers of infant formula and toddler nutritional drinks. INCA's four member companies produce over 95% of the infant formula that is consumed in the U.S. Three INCA members provide all of the infant formula consumed by infants enrolled in the WIC program. As the largest private partner to the WIC program, INCA members contribute \$1.5-2.0 billion annually to the WIC program in the form of infant formula rebates. This accounts for approximately 60% of WIC's total food costs and 25% of total program costs.

Task Force Representation: Robert represents Group F, manufacturers of supplemental foods, including infant formula.

Jay Saunders

GCOM – Three Sigma

Jay Saunders is the Senior Director for Product Development in GCOM Software’s Nutrition Services team. Jay has worked with WIC management information systems and WIC banking services for over 15 years. During that time he has been responsible for the development, maintenance and implementation of 2 State Agency Model (SAM) WIC systems and 3Sigma’s WIC on the Web platform. Jay has managed 5 statewide WIC implementation projects and assisted with many others. In his product development role, Jay is responsible for the creation of GCOM’s next generation of WIC solutions and services.

GCOM Software provides a variety of public sector solutions and services. GCOM’s 3Sigma WIC team currently supports over 43% of all WIC participants nationally. Our nutrition team has extensive experience with the development, implementation, and maintenance of WIC management information systems.

GCOM's Technical Headquarters is located in Albany, NY, and its Business Headquarters is located in Columbia, MD. GCOM has office locations around the country, including Kansas City, MO, New York City, and Tallahassee, FL. GCOM LLC is backed by Sagewind Capital, a middle-market private equity firm, and Bagnols Family Office Investment Partners.

Task Force Representation: Jay represents Group E, technology companies with experience maintaining the special supplemental nutrition program information systems and technology, including management information systems or electronic benefit transfer services..

Hannah Smith

Food City/KVAT Foods Inc.

Task Force Representation: Hannah represents Group A retailers of supplemental foods.

Candice Trujillo

Southwest Region WIC Program, Las Cruces, NM

Candice Trujillo is a native of Las Cruces, New Mexico. In 2015, she made the career move to the New Mexico WIC program as the Southwest Regional Program Manager fulfilling her passion to work with pregnant women, infants and children. The Southwest region was selected to partake in the online shopping pilot with the emphasis on small and mid-sized vendors. Candice has been an integral part of the success of the pilot and working closely with the vendors. Candice graduated from New Mexico State University with a bachelor’s degree in Community Health and continued her education obtaining a master’s degree in Education, with an emphasis on Curriculum and instruction for adult learning. She began her career working as a promotor for a rural community program, focusing on prenatal care and healthy pregnancies. Which led her to discover her passion in working towards healthy outcomes for pregnant women and babies. Candice went on to work for NMSU as an extension associate faculty member where she taught parenting classes in the community for seven years.

Task Force Representation: Candice represents Group D, representatives of local agencies.

Hannah Walker & Tres Bailey
Walmart, Inc.

Hannah Walker is Senior Director, Payments Policy & Strategy on Walmart’s Global Treasury team. Hannah leads Walmart’s payments policy work setting strategy and serving as a subject matter expert focusing on driving sound public policy to improve the U.S. payments system. Hannah joined Walmart in July 2021 after working at FMI – The Food Industry Association for over nine years. As FMI’s Vice President of Political Affairs, Hannah handled a broad portfolio of issues that included payments, SNAP, WIC, data security and privacy. At FMI Hannah ran the Electronic Payments System (EPS) committee focused on improving the U.S. payments system to work more equitably for all stakeholders. Hannah is a native Tennessean, she earned her bachelor’s degree from Middle Tennessee State University and her law degree from the University of Memphis. In 2019, Hannah was honored as a Top Woman in Grocery by Progressive Grocer.

Task Force Representation: Hannah and Tres represent Group A retailers of supplemental foods.

Kate Weinograd, Mapetsi Policy Group
House Committee on Rules
4/1/2022

I am submitting this testimony to highlight the food insecurity and hunger issues that impact tribal communities across the country. I have worked on behalf of tribal governments for over a decade and teach Federal Indian Law as an adjunct professor at the Boston University School of Law.

Thank you, Chairman McGovern and Members of the House Rules Committee, for shining a light on food insecurity among tribal communities. Like many places in America, Indian country is no stranger to hunger. I applaud the Committee's efforts to develop policy proposals to end hunger and the Chairman's outreach to Tribal leaders to understand better how this issue impacts Indian country.

Before the COVID-19 pandemic, rates of food insecurity for American Indian/Alaska Native households were double that of non-native households. Whereas one in eight Americans faced food insecurity in 2019, one in four Native Americans were food insecure. The pandemic only exacerbated the problem. The reasons for food insecurity and hunger vary across Indian country. Some common themes include a lack of local food production, high food costs, high rates of unemployment, and few retail food options.

Tribal Food Sovereignty

Sustainable, productive agriculture is an area where tribes can make a meaningful difference in food insecurity within their membership. Communities that can produce their own culturally appropriate, healthy foodstuffs see less food insecurity, especially among children and elders.

To engage in productive agriculture, tribes need access to water. Across the Southwest, tribes struggle to access the water supplies they need to build internal agricultural capacity. This happens despite countless water settlement agreements promising reserved water for the exclusive use of a tribe. Congress should fund these outstanding water settlements to ensure that tribes can access the water they need to build local food systems.

Further, tribes need federal support to protect and preserve their native seed stocks. Since time immemorial, tribes have been utilizing specific varieties of plants for food, medicine, and religious and cultural practices. These plants are an essential part of a culturally relevant diet and help address ongoing issues surrounding diabetes and obesity. Congress should assist tribes in their work to protect heritage seed stocks for the next generation.

Traditional Food Systems

Across the Northwest and Great Lakes, tribes have depended on salmon and other fish as a primary food source. Sadly, environmental changes, climate change, and habitat destruction have devastated fish populations and led to a significant decrease in the ability of tribes to engage in subsistence-level fishing. Over the past five years, numerous tribes have had to limit or completely restrict fishing for specific salmon stock in the Pacific Northwest. Congress should continue working with tribes to support fishery programs and fund tribal-focused climate resilience programs to ensure the rivers and lakes can support robust fish populations.

Federal Food Assistance Programming

Two primary food assistance programs address hunger in Indian country. The first is the U.S. Department of Agriculture (USDA) Supplemental Nutrition Assistance Program (SNAP) and the Food Distribution Program on Indian Reservations (FDPIR). SNAP is only useful in areas with accessible grocery stores, so FDPIR is the only option for supplemental food assistance in many parts of the country. FDPIR is administered by 105 tribal nations and three state agencies and provides benefits and nutrition education services to approximately 278 federally recognized tribes across the United States. In 2020, the program served approximately 75,000 individuals per month.

Congress should ensure that these programs, especially FDPIR, support the purchase and distribution of healthy, traditional, and locally sourced foods. This will support tribal food sovereignty and provide a more culturally relevant diet. It will also help tribes develop internal agricultural capacity by creating more demand for their products.

The 2018 Farm Bill created the authority for tribes to enter P.L. 93-638 contracts with the USDA through a Self-Determination Demonstration Project. In October 2021, seven tribes entered into agreements with USDA to operate programs under FDPIR. This is an essential first step in supporting tribal food sovereignty. Congress should examine ways to bring similar changes to the SNAP program.

Thank you for your efforts to address this critical issue. I look forward to working with you on policy proposals that could bring meaningful change and end hunger in Indian country.

U.S. HOUSE OF REPRESENTATIVES
COMMITTEE ON RULES
EST. 1789 | JAMES P. McGOVERN (MA-2), CHAIRMAN

U.S. HOUSE OF REPRESENTATIVES
Committee on Rules

LETTERS OF SUPPORT

February 2021 - present

BOB DOLE

April 15, 2021

The Honorable James P. McGovern, Chairman
The Honorable Tom Cole, Ranking Member
House Committee on Rules
United States House of Representatives
The Capitol
Washington, D.C. 20510

Dear Jim and Tom,

I am writing to commend your joint efforts to address hunger in America. It sure brings back fond memories of working with George McGovern many years ago. Some thought we were an odd couple, but I still believe bipartisanship can work effectively.

The 1969 White House Conference on Food, Nutrition, and Health was a call to action that led to the development of critical programs that continue to support millions of Americans five decades later. I remain proud of the work Senator McGovern and I did then, and I endorse your effort to secure a second White House Conference to identify the next frontier of programs to finally end hunger in America.

Our nation must keep making strides to end food insecurity in America. I appreciate your work to bring the topic of nutrition front and center in the United State Congress. Thanks for all you continue to do.

God Bless America,

A handwritten signature in black ink, appearing to read "Bob Dole". The signature is fluid and cursive, with a large, sweeping initial "B".

BOB DOLE

BOB DOLE

February 5, 2021

President Joseph R. Biden
The White House
1600 Pennsylvania Avenue, N.W.
Washington, D.C. 20500

Dear Mr. President,

Congratulations on your election. You have devoted your life to public service, and I wish you great success. Of course, you are still a young man compared to me, so I have no doubt you'll make our nation proud.

I hesitated to write given the number of critical issues on your plate. I know, however, that you share my passion for global food security – a passion shared by our mutual friend, the late George McGovern.

The United Nations is hosting a Food Systems Summit later this year because the number of hungry people has been increasing, even before COVID-19. We are not on course to eliminate hunger by 2030, which is the UN goal.

I hope the administration will be an active participant and the United States will urge the United Nations to follow the science. Fighting hunger must be based on science, not politics. The goal is to raise yields, which means extending all options to farmers around the world.

I am here to help you in any way. Thank you, in advance, for your attention to this crucial issue.

God Bless America,

A handwritten signature in black ink, appearing to read "Bob Dole". The signature is fluid and cursive, with a large loop at the end.

BOB DOLE

April 27, 2021

The Honorable James P. McGovern
U.S. House of Representatives
370 Cannon House Office Building
Washington, DC 20515-2102

Dear Congressman McGovern:

On behalf of the 3 million members of the National Education Association, who teach, support, and nurture students in 14,000 communities across America, we submit these comments about the importance of providing healthy school meals to all students, at no charge to them, for the record for your April 28 hearing on ending hunger in America. During the pandemic, Congress and USDA have effectively created a short-term universal school meals program to meet unprecedented levels of hunger. We know that unacceptable levels of food insecurity existed prior to this crisis, and will persist long after. By making healthy school meals universal, free, and permanent, we can go far in addressing childhood hunger, and so much more.

Universal school meals would accomplish the following:

Support learning and improve health.

Ensuring that all students—no matter what their family income is or where they live—receive fresh, healthy school breakfast and lunch will help energize and prepare them for school, regardless of whether they are learning in person or remotely. The research bears this out. Students who participate in school breakfast programs attend school more regularly, behave better, perform better in the classroom, and achieve more in school, according to the [Food Research & Action Center](#) (FRAC).

Not only do school meals support student achievement; additional studies have found that students are eating healthier school meals than ever before. A [study published recently by JAMA Open Network](#) found that the nutritional quality of school food surpasses the nutritional quality of food students get elsewhere—and the quality of school meals greatly increased following passage of the Healthy Hunger-Free Kids Act of 2010. Healthy school meals place students on the path toward developing lifelong healthy eating habits that could generate long-term health care savings for our nation.

End the shame and stigma that students often associate with free school meals and lead to higher participation in the program.

Many students need a nutritious breakfast and lunch at school but do not participate in the program because they are embarrassed, especially as they get older and become more aware of their circumstances relative to other students. In fact, although 30 million students qualified for free or reduced-price meals in 2019, on an average school day, only 21.8 million participated in the school lunch program, and only 12.5 million ate school breakfast, according to FRAC. Universal school meals for all students would eliminate any stigma around the program, and therefore encourage participation.

Universal school meals would also reduce the “lunch shaming” that results from local district policies

that single students out for accumulated unpaid meal charges. Some districts take meals away from these students, or replace them with sandwiches or other alternatives that make the students' circumstances painfully obvious.

Help schools save money and reduce the paperwork required to certify recipients.

Healthy school meals for all students would lift the burden of unpaid meal debt from schools, and relieve them of complicated and burdensome paperwork required to certify students. We also know that many students actually need school meals but may not qualify for them. Universal school meals would enable food service workers to spend more time on preparing and serving healthy meals, and less time on doing the paperwork necessary to make sure students qualify to receive meals.

Universal school meals would also result in an overall cost savings to schools due to economies of scale: Meals actually cost schools *less* per student when *more* students participate in the program, according to a study by the [Milken Institute of Public Health](#) at George Washington University.

Finally, America—the wealthiest nation in the world—should not means-test children for food. We can do better. The pandemic brought into sharp focus the depth of food insecurity in the United States, and it also demonstrated that our nation's food service workers have been valiant in their dedication to providing meals to students in all communities, even under the most challenging circumstances. We must build on this knowledge and provide all students with healthy school meals at no charge to them, building a solid foundation for growth and learning, cultivating lifelong healthy eating habits, and dramatically reducing childhood hunger.

Sincerely,

Marc Egan
Director of Government Relations
National Education Association

ACHIEVING HEALTH EQUITY THROUGH CROSS-SECTOR COLLABORATION

April 28, 2021

The Honorable James P. McGovern
Chairman
Committee on Rules
U.S. House of Representatives
H-312, The Capitol
Washington, DC 20515

Dear Chairman McGovern:

On behalf of The Root Cause Coalition (TRCC), we write to offer our enthusiastic support of the Committee on Rules' efforts to end hunger in America. We deeply believe that the Committee's hearing entitled "*Ending Hunger in America: Challenges, Opportunities, and Building the Political Will to Succeed*" is a much-needed step towards addressing long-standing health inequalities in our nation.

As a coalition of cross-sector organizations committed to achieving health equity, TRCC is grateful for the Committee's bold decision to focus on food insecurity. As you well know, access to nutritious food is central to achieving health equity and is a basic human right. We believe the Committee on Rules can accelerate substantive progress towards ending hunger and we are especially grateful for the Committee's effort to highlight conditions that persist outside the traditional scope of health care.

As always, thank you for your leadership and your continued attention to health and economic inequalities. We stand ready to support your effort towards mutual goals of achieving health equity for every American.

Sincerely,

Barbara Petee
Executive Director
The Root Cause Coalition

Thomas Dorney
Director
The Root Cause Coalition

April 28, 2021

Chairman Jim McGovern
House Committee on Rules
H-312 The Capitol
Washington, DC 20515

Dear Chairman McGovern,

We, the Food Bank Coalition of Massachusetts (FBCMA), are writing in support of today's hearing and your overall effort to convene a White House Conference on Food, Nutrition, and Hunger and end hunger in the United States by 2030. Over the past year, the food banks have responded to a historic level of need, which has both shined a spotlight on food insecurity and created a renewed urgency for action.

According to Feeding America, Massachusetts had the highest increase in food insecurity in the country in 2020, with 1 in 8 people and 1 in 6 children affected. FBCMA's network, which includes 1,000 food pantries, meal programs, shelters, and mobile markets, served an average of 64% more individuals last year compared to 2019.

The pandemic has taken a devastating toll on our families, but it has also produced temporary policy solutions that offer a permanent path forward. We support the significant strides that the Biden administration and USDA have made to date, including the American Rescue Plan, boosts to SNAP and P-EBT, and the rescinding of the previous administration's public charge rule.

FBCMA recommends the following actions for reducing food insecurity in Massachusetts and across the country. We also recommend that throughout the policymaking process, BIPOC individuals and those with lived experience are part of both the planning and decision-making.

- USDA adoption of the Low-Cost Food Plan in determining SNAP benefits, or better yet, a food cost plan that reflects the real cost of healthy food that nourishes families.
- Minimize the "cliff effect" by extending the time frame households can continue to receive benefits and/or reduce benefits gradually over time.
- Allow senior citizens, people with disabilities, and unhoused people to use their SNAP benefits to purchase hot foods.
- Invest more funds to support local farmers.
- Continued funding for BIPOC farmers.
- Connect local farmers with people experiencing food insecurity through school meals and USDA distribution programs.
- Create a national communications strategy to end the stigma around food insecurity and accessing federal nutrition programs.
- Subsidize childcare and pre-kindergarten so that all women and single parents have more flexibility and support to enter the workforce.

Returning to pre-pandemic levels of food insecurity is unacceptable – we need to solve this problem once and for all. The pandemic has showed us that food banks cannot solve hunger alone through more donated and purchased food. Only federal programs such as SNAP and unemployment assistance can scale up to address a crisis like we saw over the past year. We need federal policy solutions to truly address the root causes of hunger.

Thank you for being a long-time champion and leader on the issue of ending hunger. We look forward to being continued partners in this effort.

June 25, 2021

Dear Secretaries Austin, McDonough, and Vilsack:

Recently, the House Committee on Rules began an examination of hunger across the nation to create a roadmap to end hunger by 2030. On May 27, we heard from experts who told us that our servicemembers, veterans, and their families need more support to consistently put nutritious food on the table. We write to share those findings, present some possible solutions, and enlist your help in pushing past silos to meet the needs of our military members and their families.

Improve data collection by all departments

Since the Department of Defense (DoD) does not release systematic data on food insecurity, organizations conduct voluntary surveys to understand issues that impact military families. For example, Blue Star Families found that 14 percent of active-duty military families surveyed face food insecurity. For military spouses out of work, that number is up to 20 percent.¹ A recent study found that one in three U.S. Army soldiers surveyed at one base faced food insecurity during the pandemic, a 150 percent increase from the previous year.² Yet, without public data available at the branch of service-level, policymakers, base commanders, and advocates are left to rely on helpful but unreliable survey data regarding the extent of food insecurity across branches of service, states of residence, military bases, and demographics.

We encourage the DoD to work with the U.S. Department of Agriculture (USDA) to include food insecurity screening questions in the DoD Status of Forces Survey and the Active Duty Spouses Survey to better understand food insecurity among adults and children in the household. It is critical the DoD ensure that collection of this data does not negatively impact a servicemember's career opportunities. Further, we encourage each department to highlight other sources of data – both administrative and survey data – that would be helpful to better understand and address food insecurity, and to work with each other and Congress to ensure this data is collected and shared across your departments.

Remove Basic Allowance for Housing from the Supplemental Nutrition Assistance Program calculation

¹ Blue Star Families. (2020). *Military Family Lifestyle Survey: Comprehensive Infographic*. https://bluestarfam.org/wp-content/uploads/2021/03/BSF_MFLS_Comp_Infographic_2020.pdf

² Rabbitt, M. P., Beymer, M. R., & Reagan, J. J. (2021). Changes in Food Insecurity and Food Access Among Active-Duty Soldiers During the Coronavirus Pandemic. Working paper.

The Basic Allowance for Housing (BAH) given to servicemembers who live off-base counts as income for the purposes of the Supplemental Nutrition Assistance Program (SNAP) calculation, often keeping military families from the financial support they need to feed themselves and their children. Yet, civilians receiving housing benefits such as Section 8 or public housing are exempted from counting those funds toward their monthly SNAP allotment, as are in-kind housing benefits extended to servicemembers living on-base. Further, the BAH is not considered taxable income by the Internal Revenue Service and is not counted in other federal means-tested programs like the school meal programs.

Experts have suggested that USDA has the statutory authority to change this policy administratively, and if true, we strongly encourage you to do so. However, if an act of Congress is required, we request that you explain why the department lacks the ability to make this needed change and to work with Congress on a legislative solution.

Examine how base pay increases would ease food insecurity

Base pay for enlisted servicemembers – particularly those with dependents – impacts food insecurity. For example, a military servicemember supporting a spouse and children on their E1-E4 salary alone is likely living below 130 percent of the federal poverty line.³ For other U.S. households living below 130 percent of poverty, 33 percent experienced food insecurity.⁴

We ask DoD, in consultation with USDA, to determine and report back to Congress how base pay increases may improve food insecurity, as well as strategies and policies to avoid inadvertently pushing these families to face the so-called “benefits cliff,” leaving a family with fewer dollars and less support than before. Further, we ask the Department of Veterans Affairs (VA) to consider and report back to Congress how economic stability attained from higher wages while serving could improve the economic outlook for veterans after returning to civilian life.

Reform Basic Allowance for Subsistence for servicemembers and families

Currently, servicemembers receive Basic Allowance for Subsistence (BAS) to offset the costs for meals and, according to DoD, the allowance is not intended to cover meals for family members. In Fiscal Year 2021, the BAS rate is \$266.18 a month for officers and \$386.50 a month for enlisted service members. According to the USDA, in April 2021, the moderate-cost plan for groceries for a family of four with children is \$1,120.90 a month. For junior service members like an E-1 with less than four months of service, this means over 80 percent of net income each month is spent on groceries (not including BAS or BAH).

We ask DoD to consider reforming BAS to cover family members and increase the allotment per month specifically for junior enlisted servicemembers with dependents. We believe this reform would directly address military hunger issues for families with dependents.

Examine how a short-term SNAP guarantee could smooth transition into civilian life.

³ Leibman, A. J., & Protas, J. (2021). Hungry in the Military. <https://www.mazon.org/wp-content/uploads/MAZON-Military-Hunger-Report-April-2021.pdf>

⁴ Coleman-Jensen, A., Rabbitt, M. P., Gregory, C. A., & Singh, A. (2020). Household food security in the United States in 2019, ERR-275. *US Department of Agriculture, Economic Research Service.*

Separating from the military and reentering civilian life is fraught, particularly for those separating at younger ages or with a disability, leaving too many new veterans facing food insecurity. We need new strategies to improve this transition for servicemembers and their families. To ease this transition while preventing food insecurity, one expert suggested a guaranteed, short-term SNAP allotment for every separating family of a servicemember at the rank of E-6 and below.

We ask each department to evaluate how this idea could ease the transition to civilian life while curbing food insecurity and report those findings to Congress. Additionally, we ask for your ideas to ease this transition and better support the economic stability of new veterans and their families.

Create and expand on-site pantries and diet-related programs at VA medical centers

We heard from Mountaineer Food Bank in West Virginia about their partnership with the area VA hospital to supply food boxes to vets facing food insecurity. While Mountaineer reaches 900 vets per month, there are at least 1,300 vets known to need help in Mountaineer's service area. Before the food box initiative, Mountaineer and the hospital considered an on-site food pantry approach similar to programs run in civilian hospitals like the Boston Medical Center to address food insecurity and better impact diet-related diseases. Obstacles surrounding space, allergies, and general feasibility sidelined the effort.

We ask the VA, in consultation with USDA, to determine and report back to Congress how on-site food pantries may improve food security and combat diet-related diseases, identify obstacles to adding pantries to VA medical facilities serving food-insecure veterans, and work to close the hunger gap for veterans through these facilities.

Work with congressional partners to better combat veteran homelessness

While there have been great strides over the last decade to better connect veterans to stable housing, nearly 40,000 vets are homeless and another 25,000 are unstably housed. Veteran homelessness creates barriers to accessing other needed services and benefits these vets qualify for, such as SNAP. We ask each of your departments to think critically about the challenges homeless vets face in securing nutritious, regular meals, and to ensure they are not blocked from receiving the important services they need.

Our military families and veterans deserve nothing less than our nation's ongoing commitment to them and their children. And that commitment must include the promise that no one who served – nor their family members – goes without the food they need to live a healthy life. If we work together across your department's jurisdictions to find new solutions, we can keep this promise.

Thank you for your attention to these important matters. We stand ready to work with each of you on behalf of those who served.

September 1, 2021

Dear Mr. President:

Under your leadership, the United States continues to respond to the unprecedented health and economic hardships caused by the COVID-19 pandemic. We remain proud of our work together.

Yet, the pandemic exacerbated the realities of the nation's hunger crisis. Even before the pandemic, nearly 40 million Americans went hungry. The status quo isn't working. We need transformational change now.

We call on you to convene a national conference on food, nutrition, hunger, and health that draws together all the arms of government, state and local leaders, tribal leaders, nonprofit and for-profit businesses, advocates, and those with lived experiences to design a roadmap to end hunger in America by 2030. By working past artificial government silos and focusing on holistic solutions, we can improve the nation's health and nutrition while strengthening our food delivery system.

The first and only conference on food insecurity took place 52 years ago. Through that effort, Congress built the hunger safety-net we know today. We stand ready to work alongside you to chart the final frontier to end hunger and to create a future where the promise of America is in reach for every person in America.

Washington, DC 20515

The Honorable Jackie Walorski
U.S. House of Representatives
466 Cannon House Office Building
Washington, DC 20515

Dear Representatives McGovern and Walorski:

AARP, on behalf of our nearly 38 million members and all older Americans nationwide, is pleased to endorse the White House Conference on Food, Nutrition, Hunger, and Health Act. We appreciate your bipartisan leadership in introducing this legislation in an effort to end hunger in America.

Over 9 million older adults across the country struggle to put food on the table. Older adults may face life challenges as they age—such as experiencing a medical crisis, job loss, or the death of a spouse or other loved one—that may result in financial instability and make it difficult to afford food. Rising food prices can mean the difference between putting a meal on the table and going without for low-income seniors living on a fixed income. When financially strained, older adults are often forced to choose between paying for food and paying for other necessities like rent, transportation, and medical bills.

In times of need, many older adults turn to a variety of support networks to access food, including programs like the Supplemental Nutrition Assistance Program (SNAP), the Older Americans Act (OAA) Nutrition Programs, the Commodity Supplemental Food Program (CSFP), and The Emergency Food Assistance Program (TEFAP). However, millions of older adults who are eligible for federal support through SNAP still do not enroll or face challenges staying enrolled for reasons like stigma, social isolation, or a burdensome application process. Food and nutrition security is a complex issue, requiring a comprehensive approach that thoughtfully engages a number of sectors beyond traditional nutrition assistance programs. Thus, we applaud this effort to hold a substantive, policy-based, and action-oriented White House hunger conference to end hunger and improve nutrition.

AARP stands ready to work with you to address the pressing food needs of older Americans across the country. If you have any questions, please feel free to contact me, or have your staff contact Nicole Burda on our Government Affairs staff at nburda@aarp.org.

Sincerely,

A handwritten signature in purple ink that reads "Bill Sweeney". The signature is fluid and cursive, with a large initial 'B' and 'S'.

Government Affairs

The Honorable Jim McGovern
Chairman
Committee on Rules
U.S. House of Representatives

December 14, 2021

Dear Representative McGovern,

As chair of the National Association of Counties (NACo) Human Services and Education Policy Steering Committee, I write to thank you for taking the time to meet with county officials to discuss local efforts to combat food insecurity. NACo applauds your leadership in pursuing bipartisan solutions to the hunger crisis that continues to impact our communities. County governments remain committed to partnering with Congress and the Administration to ensure all county residents can access the healthy food they need to thrive.

Counties serve as the front line of the social safety net, providing critical services funded by a combination of federal, state and local dollars that safeguard the health and economic wellbeing of our residents. Counties are involved in promoting public health through 1,943 local health departments, while 257,000 county human services employees across the country deliver vital services to our nation's most vulnerable populations. We administer key federal nutrition programs, such as the Supplemental Nutrition Assistance Program in 10 states and the Special Supplemental Nutrition Program for Women, Infants and Children (WIC) in health departments across the nation, but we also contribute funding—including Recovery Funds allocated under the American Rescue Plan Act of 2021—to local food insecurity initiatives. We are also investing our flexible Recovery Funds, allocated under the American Rescue Plan Act, to help our vulnerable residents and businesses put food on the table as we continue to respond to the COVID-19 pandemic.

We can and must do more to ensure no family has to wonder where its next meal is coming from, and county governments are uniquely positioned to help inform and implement national policies to accomplish this goal. From identifying burdensome red tape and necessary flexibilities to making federal assistance programs more responsive to local economic conditions, counties stand ready to work with our federal partners to eliminate hunger once and for all. We join you in urging our partners at the White House to convene a National Hunger Conference to spur a whole-government approach to the epidemic of hunger and food and nutrition insecurity. Additionally, we ask you to ensure that the National Hunger Conference include a NACo representative to ensure the county voice and perspective remains part of these important conversations.

Once again, thank you for generously taking the time to meet with county officials to learn from our perspective and share your inspiring vision for ending hunger in America. We stand ready to work with you on this matter. Please direct any follow-up items or questions to NACo's Associate Legislative Director for Human Services and Education, Rachel Mackey, at rmackey@naco.org

Sincerely,

Craig Rice
Council Member, Montgomery County, Maryland
Chair, NACo Human Services and Education Steering Committee

December 14th, 2021

The Office of Joseph R. Biden
President of the United States
1600 Pennsylvania Ave,
Washington DC 20500

RE: Institutions across the country support a national conference on food, nutrition, hunger, and health that also focuses on college student hunger.

Dear President Biden:

Thank you for your continued proactive responses to the unprecedented health, economic, and education hardships caused by the COVID-19 pandemic.

We, as a higher education community, join the call by all [twenty-five house committee chairs](#) to convene a national conference on food, nutrition, hunger, and health that draws together all the sectors of government, state and local leaders, tribal leaders, nonprofit and for-profit businesses, researchers, students, advocates, and those with lived experiences to design a roadmap to end hunger in America by 2030. By working past government silos and focusing on comprehensive solutions for college students, we can overcome the issue of food insecurity in this underrepresented population and thereby improve the nation's health and nutrition while strengthening our country's food system.

Recently, the higher education community was affirmed by the inclusion of college students and eradicating college hunger as priorities in the "Ending Hunger In America" efforts led by House Committee on Rules Chairman James P. McGovern (D-MA). On Wednesday, September 8th, "[Ending Hunger in America: Hunger on College Campuses](#)" was the eighth in this committee's series to inform and vision a future where hunger is no longer a daily experience for college students across our country. By the end of this session, it was presented that:

- (i) One in three college students experience food insecurity, with disproportionately higher rates of insecurity across first-generation college students, pell grant recipients, students with disabilities, students with dependents, and other intersectional identities.*
- (ii) We have research and existing effective models that can be amplified as transformative solutions for college students across our country.*
- (iii) A bipartisan commitment could eradicate college hunger.*

With that, it is time to eradicate hunger on college campuses across the country.

To date, there has only been one conference on food security, which took place 52 years ago. Through that effort, Congress developed the hunger safety-net programs that support millions of Americans at every stage of the life course in securing access to meals. Unfortunately, college students were missed in the design of this safety net. The unique challenges that today's college students experience through their undergraduate or graduate/professional school academic paths warrant consideration. We strongly believe that by eradicating college hunger among college students, we will improve their abilities to access, perform, and succeed so that they can make meaningful contributions in the communities they serve after completing their degrees.

We are ready to work alongside you to chart the final frontier to end hunger and to create a future where the promise of the American Dream is in reach for every person in our country.

Sincerely,
The undersigned institutions of higher education and organizational partners

Congressman for the 2nd District of Massachusetts
370 Cannon House Office Building
Washington, DC 20515

RE: White House Conference on Food, Nutrition, Hunger, and Health

Dear Congressman McGovern:

On behalf of the [Food and Regional Agriculture Member \(FARM\) Policy Committee](#) of the Metropolitan Washington Council of Governments (COG), we are writing to offer our support for H.R.5724 - White House Conference on Food, Nutrition, Hunger, and Health Act. As the association of local governments in the metropolitan Washington region, COG supports measures that will increase food security and food system resiliency.

Now is the time to hold such a national conference to usher in an updated and wholistic approach to ending hunger and improving health and nutrition. Against a backdrop of growing local, state, and regional investments to support food security, collaboration, and food system resilience, the pandemic has heightened understanding of the critical role that federal nutrition programs play as our first line of defense against hunger. At the same time, there are gaps in who is served by these programs and persistent disparities in who is burdened by food insecurity. These issues require national dialogue and action at all levels of government.

Reducing food insecurity, including through the expansion of federal nutrition benefit programs, is a central goal of FARM's and one of COG's legislative priorities. We believe a White House Conference on Food, Nutrition, Hunger, and Health would be a critical forum for this discussion; as such, we have a strong interest in participating. We see this as an opportunity to share what we have learned during COVID-19 about the ways that local, state, and federal policy can respond to support healthy food access and more equitable regional food systems, as well as to learn from others.

Please contact Lindsay Smith, COG's Regional Food Systems Planner at (202) 962-3309 or lsmith@mwcog.org if you have any questions. Thank you for your consideration.

Sincerely,

DEAR CHAIRS LEAHY, DELAURO, VAN HOLLEN, AND QUIGLEY AND RANKING MEMBERS SHELBY, GRANGER, HYDE-SMITH, AND WOMACK:

As you continue finalizing Fiscal Year (FY) 2022 appropriations, we, the undersigned organizations, urge you to include funding for a White House Conference on Food, Nutrition, Hunger, and Health (“Conference”). The Conference, proposed by bipartisan legislation from Senator Booker and Representative McGovern (S. 3064/H.R. 5724), received [\\$2.5 million](#) in funding in the House-passed FY22 Financial Services and General Government appropriations bill. Ensuring that this funding is included in the final FY22 appropriations package could have a transformational impact on helping end our nation’s hunger crisis.

Our 21 organizations have worked to stem inequities in education — and addressing hunger for our students from pre-K to college is essential in our efforts. Research shows that hunger is deeply [detrimental](#) to learning. Students with consistent access to healthy food perform better on assessments, have better attendance rates, and long-term positive outcomes. Food security is essential for educational equity.

At its core, food insecurity is also a racial justice issue, and the pandemic exacerbated food insecurity among communities of color. Two in five [Black and Latino households](#) (nearly 40%) with children struggled to put food on the table at the beginning of the pandemic.

It is abundantly clear that Black, Latino, and Native students, as well as students from low-income backgrounds, have suffered disproportionately from the negative effects of the COVID-19 pandemic, resulting in disproportionate amounts of unfinished learning. It will take leaders from every sector to work together to support the students who have suffered the most.

For nearly two years, the federal government has unified to deploy unprecedented resources to ensure students and families have sufficient access to nutritious food. The Pandemic Electronic Benefits Program (P-EBT) provided essential benefits to more than 8 million families during school closures last year — and [lifted at least 2.7 to 3.9 million children](#) out of hunger during that time. The Department of Agriculture expanded eligibility and increased maximum benefits for the Supplemental Nutrition Assistance Program (SNAP), [enabling at least 3 million](#) additional college students from low-income backgrounds to qualify for benefits. And the [Child Tax Credit monthly payments](#) reduced the number of families reporting they do not have enough to eat by 3.3 million. During a time of crisis, these key steps have stemmed the rise of childhood hunger and mitigated the disproportionate impact of the pandemic on students of color and students from low-income backgrounds.

Now is not the time to lose our momentum. We can end childhood hunger — but we need bold ideas, input from the people most impacted, and a national commitment to achieve that critical goal.

A White House Conference on Food, Nutrition, Hunger, and Health can help do just that. This whole-of-government approach, which we were pleased to see proposed by Senator Booker and Representative McGovern, would not only help us build on our recent efforts to address long standing silos between education, agriculture, healthcare, and hunger, but it will also facilitate important partnerships among stakeholders, and initiate collaboration across sectors necessary to end hunger.

Just as a series of Children’s Conferences hosted by U.S. Presidents from Roosevelt to Nixon — including the first White House Conference on Food, Nutrition, and Hunger — sparked real change through the creation of essential programs like SNAP, the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC), and the National School Breakfast and Lunch Program, so too can this proposed conference catalyze support for changes necessary to end hunger.

A White House Conference can rally resources around ensuring that all children have access to nutritious food. It can bring together diverse stakeholders. And ultimately, it can generate the ideas and resources that will end childhood hunger in America.

Again, we respectfully request that you include funding for a White House Conference on Food, Nutrition, Hunger, and Health in the finalized Fiscal Year 2022 appropriations package.

Thank you for your continued leadership on this critical issue.

Sincerely,

CC: Chair Tammy Baldwin, Ranking Member John Hoeven, Chair Patty Murray, Ranking Member Roy Blunt, Chair Debbie Stabenow, Ranking Member John Boozman, Chair David Scott, Ranking Member Glenn Thompson, Senator Cory Booker, and Congressman Jim McGovern

March 3, 2022

President Joseph R. Biden, Jr.
The White House
1600 Pennsylvania Avenue, N.W.
Washington, DC 20500

Dear Mr. President:

As private sector companies with a role in ensuring Americans across the country have access to nutritious, affordable food, we write to enthusiastically support the convening of a White House Conference on Food, Nutrition, Hunger, and Health.

It is long past time that we develop a national strategy to finally end hunger once and for all. The last White House Conference on this topic convened 52 years ago and led to a multi-pronged strategy that addressed malnutrition and hunger. Unfortunately, with nearly 40 million Americans going to bed hungry each night, our work is far from done.

We applaud your incredible commitment to ending hunger. Federal investments made during the pandemic have helped to stave off sharp increases in hunger, and in fact, have helped to reduce hunger, especially among children,¹ Latinos, and Black, Indigenous, and other People of Color (BIPOC).² Flexibilities enacted in the wake of the pandemic have helped us to get food to people in need as quickly as possible.

We must take the lessons learned from the pandemic and seize upon this moment. A White House Conference on Food, Nutrition, Hunger, and Health will present a once-in-a-generation opportunity to end the scourge of hunger. As private sector retailers, agricultural, food, and beverage companies, we look forward to lending our expertise to these conversations at every stage of the process, especially as they relate to strengthening the public-private partnerships that are vital to our food supply chain and anti-hunger safety net.

We call upon you to convene a White House Conference on Food, Nutrition, Hunger, and Health in 2022.

Sincerely,

President Joseph R. Biden, Jr.
The White House
1600 Pennsylvania Avenue, N.W.
Washington, D.C. 20500

Dear President Biden,

We, the undersigned national, state, and local organizations, ask you to publicly commit to convening a White House Conference on Food, Nutrition, Hunger, and Health. We *can* end hunger in America, and a public commitment to a White House Conference, with ending hunger as a key priority, is an essential step in accomplishing this goal.

Over 50 years ago, the first, and *only*, White House Conference on Food, Nutrition, and Health resulted in more than 1,800 policy recommendations to reduce hunger and promote nutrition and health. The 1969 Conference led to an expansion of the Supplemental Nutrition Assistance Program (SNAP) and the National School Lunch Program, as well as the establishment of the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC). The Conference created the meaningful and necessary conversations to address hunger and food insecurity in America at the time.

Now, more than half a century later, conversations on how we will finally put an end to hunger in America are long overdue. More than 38 million Americans, including 11.7 million children live in households that struggle to put food on the table. Food insecurity negatively impacts health, educational access, workforce readiness and business productivity. In addition, the COVID pandemic has affected food security in all corners of America, while also widening the disparities in food insecurity among individuals who are Black, Indigenous, Latino and other people of color. Food insecurity in America is a political choice and there is an opportunity to take transformative action.

A new White House Conference would bring together a broad range of stakeholders to comprehensively address food, nutrition, hunger and health in America. The conference should include the expertise of government agencies, the anti-hunger community, individuals who have experienced hunger and poverty, businesses, academia, and grassroots, healthcare and faith-based organizations. Ideally, it would seek to create a real, concrete plan to eliminate hunger and food insecurity, address hunger's root causes and ensure nutritious food is accessible to all.

As you proclaimed at your inauguration, "Ending hunger and malnutrition at home and around the world is consequential. If we do nothing today, food insecurity will loom as an even larger and bigger threat tomorrow. You're fostering a world that is more just and peaceful."

We could not agree more. With a strong public commitment and leadership, we *can* end hunger in America. **We urge you to publicly commit to convening a White House Conference on Food, Nutrition, Hunger, and Health.**

We stand in solidarity and are ready to support the White House in achieving this mission.

Thank you for your consideration,

March 15, 2022

President Joseph R. Biden, Jr.
The White House
1600 Pennsylvania Avenue, N.W.
Washington, D.C. 20500

Dear President Biden,

As pastors, faith leaders, and clergy from many faiths and traditions and every region of the United States, we commend Congress and your administration for initiating and enacting multiple bills during the ongoing pandemic to provide assistance for people living with hunger. Yet we know the work is far from over. Despite the actions of Congress and the White House, more than one in 10 households was food insecure in 2020, according to USDA analysis on household food security in the US,¹ and the ongoing Census Bureau's Household Pulse Surveys report similar levels of food hardship in 2021.²

The alarming numbers of people suffering from hunger, both in the United States and globally, is why we write to ask you to publicly commit to convening a White House Conference on Food, Nutrition, Hunger, and Health.

We believe that all people are made in the image of the divine. None should suffer needlessly from hunger. The systems that perpetuate hunger are antithetical to the values we share as people of faith. Therefore, we are united in the belief that we are called to end hunger both in the United States and around the globe.

Hunger is not a problem that an individual or family can solve alone. In the United States, institutions and policies perpetuate it, and it affects people in all parts of the country. Systemic biases, including racism and sexism, lead to higher rates of food insecurity and hunger among Black, Latino(a), Native American, and female-headed households.

Federal nutrition programs such as SNAP and WIC provide essential assistance to people struggling to put food on the table, and some programs are designed to expand if needs increase. This is a time of great and widening economic inequality in our country, and federal nutrition programs simply do not have enough funding to provide adequate services to all who are eligible. Our federal government must do more to improve and strengthen vital nutrition assistance programs to fully meet the needs of those who face hunger in this country.

We hope that the White House Conference on Food, Nutrition, Hunger, and Health will address hunger and malnutrition globally as well. The COVID-19 pandemic has affected every country. For many countries with limited resources, the pandemic has joined other causes of hunger, such as armed conflict, displacement, and climate change, to create deeper economic recessions, greater

¹ <https://www.ers.usda.gov/webdocs/publications/102076/err-298.pdf?v=4288.9>

² <https://www.cbpp.org/research/poverty-and-inequality/tracking-the-covid-19-economys-effects-on-food-housing-and>

reductions in food production, and increases in unmet needs for essential health care. The number of young children with life-threatening forms of malnutrition has soared since the pandemic began. More generally, the availability and affordability of nutritious foods have deteriorated significantly.

As people of faith and conscience, representing individuals and families who are experiencing hunger, we are hopeful about the opportunities available to our government to reduce hunger. We urge you to bring together policymakers, advocates, people with lived experience, and other stakeholders for a White House Summit to end hunger in the United States and worldwide.

In a country and a world blessed with an abundance of food, no one should go hungry. We stand ready and eager to work with your administration and Congress to improve the policies that have allowed hunger and poverty to persist in our country and around the world. Holding a White House conference will help identify and prioritize the needed changes.

Sincerely,

Alabama

The Honorable James McGovern
370 Cannon House Office Building
Washington, DC 20515

Dear Chairman McGovern:

We were thrilled to see the President sign into law the White House Conference on Food, Nutrition, Hunger, and Health. I wanted to send you our congratulations for achieving this important milestone. We are especially pleased to see that it specifies a “whole of government” approach. Thank you very much for your fearless leadership in this critical area. We share your passion on nutritional equity and look forward to more discussions in the future!

All the best,

Cain A. Hayes
President & CEO

General Business

Guiding and empowering
healthier lives

Statement of Rep. Ed Perlmutter
Hunger Roundtable Record
House Rules Committee
April 5, 2022

When considering the challenges a family can face, putting food on the table is one of the foundational building blocks towards economic stability, health, and a quality education for children. And I've championed numerous programs during my time in Congress like WIC, SNAP, TEFAP, CSFP, and Meals on Wheels to ensure my constituents have access to nutritious meals to prevent needless hunger.

What I've learned from the House Rules Committee's Hunger Roundtable series is all these programs are not enough on their own. As of April 2021, 33% of Coloradans lacked reliable access to nutritious food and 20% of adults reported having to regularly cut back or skip meals because there wasn't enough money to buy food. Colorado households led by single women with children have among the highest rates of food insecurity with nearly one in three struggling to put food on the table before the COVID-19 pandemic according to the USDA. The U.S. consistently ranks as having among the highest rates of food insecurity of any wealthy, developed country and that needs to change.

Although COVID-19 severely exacerbated the hunger crisis, it didn't create it. We did, however, learn when Congress provided federal aid, we lifted families out of poverty and got them the food they needed. However, when Congress let the aid expire, the challenges began to rise again. Throughout the pandemic, there were increases in food stamps and unemployment benefits, three rounds of economic impact payments, universal free meals at school, and new grocery benefits. The pandemic showed us how to slash hunger in America and offered us a once-in-a-generation chance to rethink critical safety net programs, in some cases changing or expanding them in ways that were previously politically impossible. Ending food insecurity isn't just a matter of charity – the status quo is expensive. Food insecurity and hunger costs about \$160 billion per year in the U.S. according to one estimate from lost productivity and increased healthcare costs.

When President Richard Nixon convened the White House Conference on Hunger in 1969, he said, "That hunger and malnutrition should persist in a land such as ours is embarrassing and intolerable." I couldn't agree more. I'm proud of the work of the House Rules Committee under Chairman Jim McGovern's leadership to convene the long overdue second White House Conference on Food, Nutrition, Hunger, and Health. Through the Rules Committee's efforts over the last year, it's become clear to me there is no one single solution to ending hunger. What we need is a systematic approach to give individuals and families the tools they need to succeed in the 21st Century. We need this White House Conference to address why people are hungry in America and how we update and restructure our food, housing, healthcare, job and many other assistance programs to meet the needs of today.

I'm proud of the work led by Chairman McGovern to convene Rules Committee Members and learn about the problems in communities across the country, how innovative organizations are helping solve difficult challenges, and begin discussing how the federal government can work together across all our agencies to finally end hunger in America.

May 2, 2022

COMMITTEE ON EDUCATION
AND LABOR
CHAIRMAN, SUBCOMMITTEE ON HEALTH,
EMPLOYMENT, LABOR, AND PENSIONS

COMMITTEE ON TRANSPORTATION
AND INFRASTRUCTURE

COMMITTEE ON OVERSIGHT
AND REFORM

COMMITTEE ON RULES
VICE CHAIR

Hunger in the United States is at a concerning level. According to the U.S. Department of Agriculture, more than 38 million people in the United States, including 12 million children, are food insecure. In order to have a meaningful impact on reducing food insecurity and the many negative impacts it has, we need to come together and work collaboratively to find and implement solutions. That is why I am so honored to have been a part of Chairman McGovern's Hunger Project.

In high cost of living areas like the Bay Area, affording food and shelter can be even more difficult. Although the Bay Area is home to some of the richest people and companies in the world, it is also the home of some of the worst income inequality in the nation: seven of the ten California counties with the biggest growth in food stamp enrollment during the pandemic were in the Bay Area. According to the San Francisco Chronicle, more than 870,000 people remain food insecure in the Bay Area, which is more than the entire population of San Francisco.

In August 2021 I had the pleasure of welcoming Chairman McGovern to the East Bay to see firsthand the way our community acknowledges and responds to hunger in unique, innovative, and scalable ways.

We started off at Mt. Diablo High School in Concord where we toured the school garden and their Sustainable Hospitality Program that encompasses a student run restaurant called Serendipity Café. Through this program, students are taught the important of nutrition and sustainable living. We then went on to Urban Tilth in North Richmond, a traditionally underserved and disadvantaged area of Contra Costa County. There, we learned about Urban Tilth's seven school and community gardens and small urban farms that are used to teach and employ community members to grow, distribute, cook, and consume thousands of pounds of local produce each year, to create a more equitable and just food system within a healthier and more self-sufficient community.

The East Bay is also home to some of the finest institutions of higher education in the country, including the University of California, Berkeley, where we visited their Food Institute to tour their community garden and meet with researchers and practitioners to learn about their research into food access, urban agriculture, and fair and health jobs; their food policy initiatives; and their work on community engagement and education. Our next stop called on some Berkeley star power in our visit with Alice Waters, world renowned chef and one of the first proponents of sustainable community gardens. We finished the day with a listening session with anti-hunger

leaders, including an opportunity to hear from people with the lived experience of hunger and partners in education and other sectors. Organized by the California Food Bank, the event features State Senator Nancy Skinner, United Food and Commercial Workers Local 5, the University of California Systemwide Basic Needs Committee; Food Bank of Contra Costa & Solano, Dolores Huerta Foundation, Service Employees International Union L. 1021, California Teachers Association, Child Care Resource & Referral Network, St. Mary's Center, Western Center for Law & Poverty, County Welfare Directors Association of California, Young Invincibles, and more.

I appreciate the opportunity to have shown the unique perspective that the East Bay brings to the issue of hunger. It is my sincere hope that through convenings like these, the hard work of anti-hunger advocates like Chairman McGovern, and a White House and federal agencies whole-of-government conference on Food, Nutrition, Health, and Hunger, we will make meaningful progress toward ending hunger in the United States.

U.S. House of Representatives
Committee on Rules
Washington, D.C.

March 28, 2022

Dear Chairman McGovern, Ranking Member Cole, and distinguished members of the House Committee on Rules:

Thank you for the opportunity to submit this letter and relevant research in support of the White House Conference on Food, Nutrition, Hunger, and Health. Our nearly 25 years of research at Children's HealthWatch strongly supports robust efforts to reduce food insecurity as a key mechanism for improving health beginning in the prenatal period and extending through adulthood. Children's HealthWatch is a network of pediatricians, public health researchers, and child health and policy experts committed to advancing health equity for young children and families by informing policies that alleviate economic hardships, including food insecurity.

Reducing food insecurity is a critical public health and health equity issue. Enclosed with this letter, I have provided multiple studies documenting the importance of reducing food insecurity for improving health outcomes and lowering avoidable health care and other costs among children and adults. I also include studies highlighting the interconnected nature of food insecurity to other hardships and the important role federal policies play in reducing food insecurity and promoting health. Below I summarize key findings from each study.

Research on associations between food insecurity, health, and avoidable health care costs and drivers of food insecurity:

- [Estimating the Health-Related Costs of Food Insecurity and Hunger](#): This report estimated the direct and indirect costs of food insecurity on health care expenditures, education costs, and lost work productivity to be \$178.93 billion in 2014. Direct and indirect costs associated with health-related expenditures was \$160.07 billion and education costs and lost work productivity costs was estimated at \$18.85 billion.
- [Association of Food Insecurity with Children's Behavioral, Emotional, and Academic Outcomes: A Systematic Review](#): This paper provides a critical summary of peer-reviewed articles documenting associations between food insecurity – even when experienced at marginal levels - and adverse childhood developmental behavioral outcomes including early development, school performance, inattention, externalizing behaviors, and depression among children.
- [Experiences of Racial and Ethnic Discrimination Are Associated with Food Insecurity and Poor Health](#): This study examined the associations of mothers' experiences of discrimination with household food insecurity, physical health, and depressive symptoms. Among a sample of mothers of young children in Philadelphia, experiences of discrimination in certain settings were associated with increased risk of household food insecurity, depressive symptoms, and adverse health outcomes.

- [Unstable Housing and Caregiver and Child Health in Renter Families](#): This study showed among a large sample of families with young children in 5 US cities, housing instability was associated with significantly increased risk of household and child food insecurity – along with other adverse health outcomes among children and caregivers.
- [A Brief Indicator of Household Energy Security: Associations With Food Security, Child Health, and Child Development in US Infants and Toddlers](#): This study found families with young children who were unable to afford home energy expenses, which resulted in threatened or actual shut offs, days without heating or cooling, and/or using a cooking stove for heat – a condition known as energy insecurity – were at increased risk of household and child food insecurity as well as poor health outcomes compared to families without energy insecurity.

Research linking federal nutrition assistance programs and reductions in food insecurity among families with young children

- [SNAP: Building a Healthy Foundation Today and Tomorrow](#): This policy report summarizes decades of research from Children’s HealthWatch and others documenting the impact of SNAP in reducing food insecurity, improving health, reducing health care costs, and supporting educational outcomes.
- [SNAP, Young Children’s Health, and Family Food Security and Healthcare Access](#): This study examined associations between SNAP participation and young children’s health and development, caregiver health, and family economic hardships. Among a large sample of families with young children in 5 US cities, participation in SNAP was associated with reduced household and child food insecurity, lower odds of developmental risk as well as poor health and growth among infants and toddlers, and reduced health care hardships.
- [Loss of SNAP Is Associated with Food Insecurity and Poor Health in Working Families with Young Children](#): This paper investigated how SNAP benefit reductions or cutoffs resulting from increased income were related to economic hardships and caregiver and child health outcomes. Analyses among a large sample of families with young children in 5 US cities showed families whose SNAP benefits were reduced or cut off had significantly increased odds of household and child food insecurity and were at greater risk of fair/poor child and caregiver health compared to those with consistent SNAP participation.
- [Prenatal WIC is Associated with Increased Birthweight of Infants Born in the United States with Immigrant Mothers](#): This study examined relationships between prenatal participation in WIC and birth weight – a key indicator of positive health in early childhood - among infants of income-eligible immigrant mothers. Among a multisite sample of mothers with low-incomes, prenatal WIC participation for income-eligible immigrant mothers was associated with healthier birth weights among infants born in the United States.

Research linking federal non-nutrition assistance programs to reductions in food insecurity among families with children

- [Association of the Implementation of Child Tax Credit Advance Payments With Food Insecurity in US Households](#): Using data from the Household Pulse Survey conducted by the US Census Bureau in 2021, this study found receipt of advance Child Tax Credit monthly

payments were associated with a 26 percent reduction in food insufficiency among families with children.

- [Bulwark Against the Storm: The unequal impact of COVID relief policies on families with young children](#): This report used longitudinal data among families with young children collected by Children's HealthWatch before and during the pandemic. Household and child food insecurity rates and rates of being behind on rent increased for all families during the pandemic, but families with immigrant mothers were at greater risk of household food insecurity and being behind on rent than families with US-born mothers. Economic Impact Payments were significantly associated with reductions in food insecurity among all families, but families with immigrant mothers were more likely to report missing out on payments than families with US-born mothers.

Thank you for your consideration of these materials. Please do not hesitate to reach out to the Director of Policy Strategy, Allison Bovell-Ammon (Allison.bovell-ammon@bmc.org) if you have any questions or would like to request further information. We appreciate your commitment to reducing food insecurity and improving health in the United States.

Sincerely,

Stephanie Ettinger de Cuba, PhD, MPH
Executive Director
Children's HealthWatch

The Honorable James P. McGovern, Chairman
The Honorable Tom Cole, Ranking Member
House Committee on Rules
United States House of Representatives
The Capitol
Washington, DC 20510

Dear Jim and Tom,

Thank you for your leadership and partnership to works towards solving hunger in America. There has never been a better time to address such an important and pervasive issue such as food and nutrition insecurity. I worked tirelessly during my years in office to find bipartisan solutions to these wicked problems.

We recently recognized the incredible work done over 50 years ago at the 1969 White House Conference on Food, Nutrition, and Health. The conference was a call to action that led to the development of critical programs that continue to support millions of Americans five decades later. Although much has been done, I believe there is still work to do and I endorse your efforts to secure a second White House Conference to identify the solutions necessary to support a healthy, equitable, and sustainable food and nutrition system.

Our nation must keep making strides to improve nutrition security in America. I appreciate your work to bring the topic of nutrition front and center in the United State Congress. Thank you for all that you do.

Sincerely,

Tom Harkin

Congress of the United States
Washington, DC 20515

February 14, 2022

The Honorable Gene L. Dodaro
Comptroller General
U.S. Government Accountability Office
441 G Street, NW
Washington, D.C. 20548

Dear Mr. Dodaro:

Tribal communities in the United States face high levels of levels of hunger and food insecurity. One study that examined USDA data from 2000 to 2010 found that food insecurity among American Indians and Alaska Natives averaged 25 percent—twice as high as the white population—while a 2019 study found that among tribes in northern California and southern Oregon, 92 percent of households suffered from food insecurity.¹ Challenges families face accessing nutritious food in these areas can include long distances to grocery stores and high prices for groceries, and the COVID-19 pandemic has exacerbated these issues.

As a result, families in tribal areas may be especially reliant upon federal nutrition programs administered by the United States Department of Agriculture (USDA), such as the Food Distribution Program on Indian Reservations (FDPIR), and the National School Lunch Program. For example, FDPIR provides food to income-eligible households living on Indian reservations to help ensure they have access to a nutritionally balanced diet, while the School Lunch Program provides free or subsidized meals to school-aged children. However, families in tribal areas may be unaware of these programs or not know how to apply, and it is unclear how USDA has supported education efforts to increase family participation. Further, certain programs—including the School Lunch Program—are directly administered by states rather than tribes, limiting tribes' ability to meet their own unique needs.

I request that you answer the following questions:

- What food security challenges exist in tribal areas?
- What federal nutrition programs are available in tribal areas and to what extent do these programs meet the unique needs of tribal communities?
- To what extent has USDA taken steps to increase participation in federal nutrition programs and address food security challenges in tribes?

¹ See <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5422031/pdf/nihms827391.pdf>, and [Restoring access to Native foods can reduce food insecurity | UC Berkeley Rausser College of Natural Resources](#).

- What opportunities, if any, exist to promote tribal administration of USDA nutrition programs?

Please contact Naomi Miguel (Naomi.Miguel@mail.house.gov) and Kim Corbin (Kim.Corbin@mail.house.gov) if you have any questions about this request.

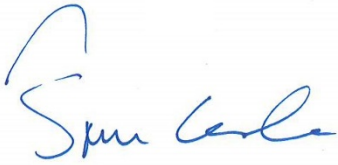

Sincerely,

Raúl M. Grijalva
Chair
House Committee on Natural Resources

James P. McGovern
Chair
House Committee on Rules

Tom Cole
Ranking Member
House Committee on Rules

441 G St. N.W.

February 25, 2022

Congressional Requesters:

Thank you for your letter requesting that the Government Accountability Office review matters relating to food insecurity in tribal communities.

GAO accepts your request as work that is within the scope of its authority. At the current time we anticipate that staff with the required skills will be available to initiate an engagement in about four months. Your request has been assigned to Ms. Cindy Brown Barnes, Managing Director, Education, Workforce, and Income Security. Closer to the time GAO can start the engagement, Ms. Brown Barnes or a member of her team will contact the staff points of contact to confirm that this request continues to be your priority for us. As applicable, we will also be in contact with the cognizant Inspector General's office to ensure that we are not duplicating efforts. If an issue arises during this coordination, we will consult with you regarding its resolution.

If you have any questions, please contact Ms. Brown Barnes at 202-512-7215 or brownbarnesc@gao.gov, or Ms. Casey L. Keplinger, Assistant Director, Congressional Relations, on my staff at 202-512-9323 or keplinger@gao.gov.

Sincerely yours,

A handwritten signature in black ink, appearing to read 'C. Keplinger', with a stylized flourish at the end.

**BIDEN-HARRIS
ADMINISTRATION
NATIONAL
STRATEGY ON
HUNGER,
NUTRITION, AND
HEALTH**

SEPTEMBER 2022

**THE WHITE HOUSE
WASHINGTON**

THE WHITE HOUSE
WASHINGTON

Today I am convening the first White House Conference on Hunger, Nutrition, and Health in over 50 years. Yes, there is still hunger in America. But over the past 50 years, we have learned so much more about nutrition and the role that healthy eating plays in how our kids perform in the classroom and about nutrition and its linkages to disease prevention. This important conference and the commitment to a national strategy on ending hunger and healthier eating will build on the research and knowledge we now have to make America truly a stronger, healthier nation.

With this gathering of elected officials; advocates and activists; and leaders of business, faith, and philanthropy from across America, we are mobilizing the will to meet a bold goal: to end hunger in America and increase healthy eating and physical activity by 2030 so fewer Americans experience diet-related diseases.

This national strategy will serve as the playbook to meet this vital goal. It calls for a whole-of-government and whole-of-America approach to addressing the challenges we face. When families can't afford healthy food options, it's harder for children to succeed in school, and it can lead to mental and physical health challenges for the whole family. For so many families—including families of color, those living in rural communities and territories, and low-income families—structural inequality, such as disparities in educational and economic opportunities and lack of access to health care, safe housing, and transportation, make the impact of hunger and diet-related diseases even more severe. The pandemic made these problems worse, reinforcing the need for urgent, sustained action.

Despite these challenges, we know what to do. This national strategy builds on the historic strides that my Administration has already made to bolster economic security for American families and cut child poverty across the country. And it harnesses our greatest resource—our fellow Americans.

Everyone has an important role to play in addressing these challenges: local, State, territory and Tribal governments; Congress; the private sector; civil society; agricultural workers; philanthropists; academics; and of course, the Federal Government. In developing this national strategy, my Administration has listened to and learned from many remarkable advocates, including people who have experienced hunger and diet-related diseases themselves. To all of you, I am grateful for your unwavering commitment to meet this moment.

Together, we can build a healthier future for all Americans.

Table of Contents

Executive Summary	4
Current Hunger, Nutrition, and Health Landscape	6
The National Strategy	8
Pillar 1—Improve Food Access and Affordability: <i>End hunger by making it easier for everyone—including individuals in urban, suburban, rural, and Tribal communities, and territories—to access and afford food.</i>	8
Pillar 2—Integrate Nutrition and Health: <i>Prioritize the role of nutrition and food security in overall health—including disease prevention and management—and ensure that our health care system addresses the nutrition needs of all people.</i>	17
Pillar 3—Empower All Consumers to Make and Have Access to Healthy Choices: <i>Foster environments that enable all people to easily make informed, healthy choices, increase access to healthy food, encourage healthy workplace and school policies, and invest in public education campaigns that are culturally appropriate and resonate with specific communities.</i>	22
Pillar 4—Support Physical Activity for All: <i>Make it easier for people to be more physically active—in part by ensuring that everyone has access to safe places to be active—increase awareness of the benefits of physical activity, and conduct research on and measure physical activity.</i>	28
Pillar 5—Enhance Nutrition and Food Security Research: <i>Improve nutrition metrics, data collection, and research to inform nutrition and food security policy, particularly on issues of equity, access, and disparities.</i>	31

Executive Summary

More than 50 years since the first White House Conference on Food, Nutrition, and Health, the U.S. has yet to end hunger and is facing an urgent, nutrition-related health crisis—the rising prevalence of diet-related diseases such as type 2 diabetes, obesity, hypertension, and certain cancers. The consequences of food insecurity and diet-related diseases are significant, far reaching, and disproportionately impact historically underserved communities. Yet, food insecurity and diet-related diseases are largely preventable, if we prioritize the health of the nation.

The Biden-Harris Administration envisions an America where no one wonders whether they will have enough money to put food on the table, where the healthy food choice is the easier choice, and where everyone has the same opportunity to be physically active. Transformative programs, policies, and system changes are needed within and outside government to achieve this vision. There is no silver bullet to address these complex issues, and there is no overnight fix. Making progress requires collective, sustained action and mobilization across every segment of society. **That is why President Biden announced a goal of ending hunger and increasing healthy eating and physical activity by 2030 so fewer Americans experience diet-related diseases—while reducing related health disparities.**¹

To advance the President’s goal—and build on the federal government’s existing work to address hunger and diet-related diseases—this strategy identifies ambitious and achievable actions the Biden-Harris Administration will pursue across five pillars:

- 1. Improving food access and affordability**, including by advancing economic security; increasing access to free and nourishing school meals; providing Summer Electronic Benefits Transfer (EBT) benefits to more children; and expanding Supplemental Nutrition Assistance Program (SNAP) eligibility to more underserved populations;
- 2. Integrating nutrition and health**, including by working with Congress to pilot coverage of medically tailored meals in Medicare; testing Medicaid coverage of nutrition education and other nutrition supports using Medicaid section 1115 demonstration projects; and expanding Medicaid and Medicare beneficiaries’ access to nutrition and obesity counseling;
- 3. Empowering all consumers to make and have access to healthy choices**, including by proposing to develop a front-of-package labeling scheme for food packages; proposing to update the nutrition criteria for the “healthy” claim on food packages; expanding incentives for fruits and vegetables in SNAP; facilitating sodium reduction in the food supply by issuing longer-term, voluntary sodium targets for industry; and assessing additional steps to reduce added sugar consumption, including potential voluntary targets;

¹ Ending hunger will be measured by a reduction in the number of households with insufficient food (defined as very low food security) to less than 1% of households and cut the number of households struggling to put enough nutritious food on the table (defined as food insecurity) in half.

4. **Supporting physical activity for all**, including by expanding the U.S. Department of Health and Human Services’ Centers for Disease Control and Prevention’s (CDC) State Physical Activity and Nutrition Program to all states and territories; investing in efforts to connect people to parks and other outdoor spaces; and funding regular updates to and promotion of the *Physical Activity Guidelines for Americans*; and
5. **Enhancing nutrition and food security research**, including by bolstering funding to improve metrics, data collection, and research to inform nutrition and food security policy, particularly on issues of equity and access; and implementing a vision for advancing nutrition science.

The federal government cannot end hunger and reduce diet-related diseases alone. The private sector; state, Tribal, local, and territory governments; academia; and nonprofit and community groups must act as well. This strategy details Calls to Action for all these entities to do their part. Taken together, these collective efforts will make a difference and move us closer to achieving the 2030 goal.

Current Hunger, Nutrition, and Health Landscape

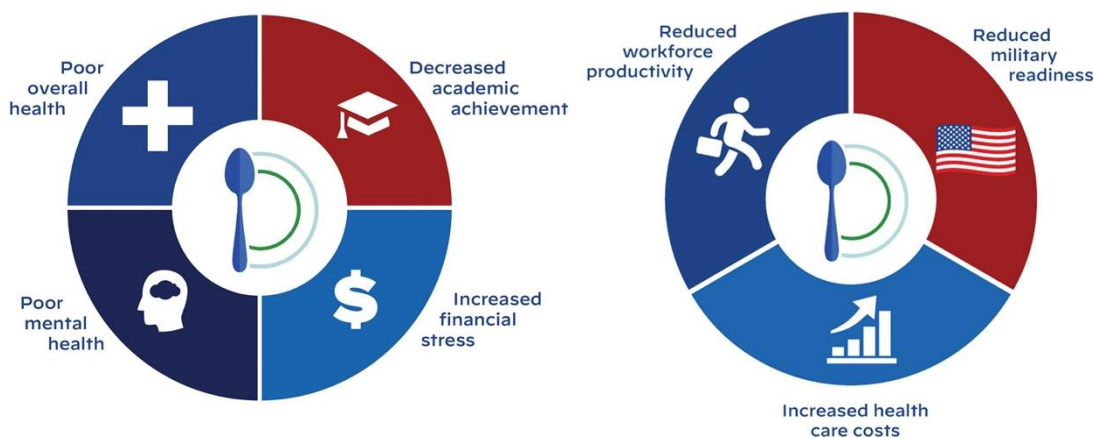

President Biden has set out a goal of **ending hunger and increasing healthy eating and physical activity by 2030 so fewer Americans experience diet-related diseases—all while reducing health disparities.**

In 2021, 1 in 10 households experienced food insecurity, meaning their access to food was limited by lack of money or other resources.¹ Nearly 4% of households in 2021 experienced very low food security, meaning they were regularly skipping meals or reducing their intake because they could not afford more food.² When someone experiences very low food security, they are most likely to also experience hunger.³

Moreover, diet-related diseases are some of the leading causes of death and disability in the U.S. New data show that 19 states and two territories have an obesity prevalence at or above 35%, more than double the number of states from 2018.⁴ One in 10 Americans have diabetes.⁵ One in 3 people will have cancer in their lifetime.⁶ And, more than 4 in 10 Americans have hypertension (high blood pressure),⁷ which is linked to the leading causes of death for Americans: heart disease and stroke.⁸

The toll of hunger and diet-related diseases is not distributed equally; these challenges disproportionately impact communities of color, people living in rural areas, people living in territories, people with disabilities, older adults, LGBTQI+ people, military families, and Veterans.⁹

Impacts of Food Insecurity & Diet-Related Diseases: Individual and Societal Costs¹⁰

The COVID-19 pandemic exacerbated food insecurity, diet-related diseases, and health disparities. At the start of the pandemic in early 2020, the percentage of food insecure households with children reached 14.8%, up from 13.6% in 2019.¹¹ This increase disrupted a decade-long downward trend.¹² Devastatingly, diet-related diseases also increase the risk for severe symptoms and death from COVID-19. One study estimated that nearly two-thirds of

COVID-19 hospitalizations in the U.S. were related to obesity, diabetes, hypertension, and heart failure.¹³

Diet-related diseases are caused in part by poor eating patterns including excess calorie intake—and the failure to meet the *Physical Activity Guidelines for Americans*.¹⁴ The vast majority of Americans do not eat enough vegetables, fruits, or whole grains and eat too much saturated fat, sodium, and added sugars.¹⁵ And, only 23% of Americans meet physical activity recommendations.¹⁶ Regular physical activity can reduce the risk of heart disease and diabetes, help manage weight, strengthen bones and muscles, and improve people’s ability to do everyday activities.¹⁷

However, a complex web of factors causes food insecurity and contributes to diet-related diseases and health disparities. Education and job opportunities; access to health care, safe housing, and transportation; and neighborhood design all affect an individual’s ability to obtain food, make healthy choices, and remain physically active. For example, people who live in communities without grocery stores offering affordable and healthy food options may face compounding challenges, particularly if they also do not have access to transit that allows them to travel to a nearby grocery store.¹⁸ Disparities in food insecurity and diet-related diseases exist in part because of persistent structural inequities. For example, people who lack access to food outlets that sell healthier foods tend to be lower-income, Black, or Hispanic; live in rural areas; and are geographically concentrated in the south.¹⁹ And, people living in territories, Alaska Natives, and Native Hawaiians are highly dependent on food imports, leading to less access to healthy and affordable foods. Additionally, children from low-income families typically have fewer opportunities to be physically active because of lesser access to safe streets and playgrounds.²⁰

The National Strategy

This strategy outlines the Biden-Harris Administration’s plan to drive transformative change to end hunger and reduce diet-related diseases and disparities. By outlining ambitious, achievable, and sustainable actions the federal government will take to fundamentally shift the country’s food, nutrition, and health policies across five pillars, this strategy creates a path to achieving our goals over the next decade.

The federal government cannot make these transformative changes alone. Accelerating this work will require actions by state, Tribal, local, and territory governments; academia; civil society; philanthropy; the private sector; and other partners. This strategy includes recommended steps these other sectors of society must take to reach our 2030 goal.

Pillar 1—Improve Food Access and Affordability: *End hunger by making it easier for everyone—including individuals in urban, suburban, rural, and Tribal communities, and territories—to access and afford food.*

A critical step to reduce hunger and associated disparities is helping all Americans become economically secure. Toward this end, President Biden signed into law the American Rescue Plan (ARP), which helped drive a historic and historically equitable jobs recovery.²¹ The expansion of the Child Tax Credit (CTC) through the ARP in 2021 helped cut child poverty nearly in half²²—driving it to record lows, including for all racial and ethnic groups measured—reduced food insecurity by roughly 26%,²³ and led to the lowest share of households with children that were food insecure on record.²⁴ The Administration has also partnered with Congress on historic legislation that will lower costs for American families—including health care costs— so they do not need to make the choice between putting food on the table and covering other essential needs.

The Biden-Harris Administration is committed to continuing progress in reducing food insecurity for American households by pushing for Congress to permanently extend the expanded, fully refunded CTC and expanded Earned Income Tax Credit. The Administration will continue to work with Congress to: raise the minimum wage to \$15 an hour; close the Medicaid coverage gap; invest in affordable, high-quality child care; and expand the Housing Choice Voucher program to ensure low-income families, older adults, and people with disabilities can afford decent, safe, accessible, and sanitary housing. The Biden-Harris Administration will continue to advance policies that increase worker power and workers’ rights to collectively bargain—including for the workers who grow, produce, and process our food, transport it to grocers, and stock grocery store shelves. Further, the Department of Defense (DoD) will implement the new Basic Needs Allowance created by Congress, which will ensure military households earn salaries sufficient to meet their basic food needs.

Along with advancing policies that bolster families’ economic security, below are additional steps the Biden-Harris Administration will pursue to improve food access and affordability.

A. Help more individuals experiencing food insecurity benefit from federal assistance programs.

Federal nutrition assistance programs such as the Supplemental Nutrition Assistance Program (SNAP), Special Supplemental Nutrition Program for Women, Infants, and Children (WIC), and the Child Nutrition Programs, increase food security and well-being and help lift tens of millions of Americans out of poverty. The Biden-Harris Administration has taken pivotal steps to dramatically expand access to and strengthen these programs. For example, building on the ARP’s temporary increase in SNAP benefits, the U.S. Department of Agriculture’s (USDA) Thrifty Food Plan update increased SNAP benefits by an average of \$36.30 per person per month beginning in October 2021. This SNAP benefit increase lifted an estimated 2.3 million people out of poverty—including nearly 1 million children, with an even greater impact on children of color.²⁵

Building on this progress, the Biden-Harris Administration will:

- **Advance a pathway to free healthy school meals for all.** Every school day across America, school meals provide critical nourishment to more than 30 million children. While school meals have demonstrated strong positive impacts on children’s nutrition and other key outcomes, we have not yet fully leveraged school meals as a core intervention to improve child health or child hunger. A “healthy meals for all” approach would reorient the school meal programs from an ancillary service to an integral component of the school day and allow schools to focus on providing the highest quality meals and engaging children around healthy food. Essential components of this approach are expanding efforts to increase access to local and regional food systems, enabling more schools to cook meals from scratch by funding training and equipment purchases, investing in the school nutrition workforce, and expanding nutrition education for children. Elevating school meals is a key strategy to improve our nation’s health and would benefit all children—importantly, it would significantly strengthen the school meals program for those children who rely upon it the most. The Biden-Harris Administration will take a major first step by working with Congress to expand access to healthy, free school meals for 9 million more children by 2032.
- **Expand Summer Electronic Benefits Transfer (EBT) to more children.** Food insecurity and weight gain increase during the summer months when children have limited access to school meals, particularly among Black and Latino children and children who are already at higher risk for obesity.²⁶ Through the ARP’s Summer Pandemic-EBT (P-EBT) program, over 36 million children received Summer P-EBT benefits in summer 2021, and 43 states and territories are on track to provide Summer P-EBT benefits to an estimated over 32 million children in 2022. Summer-EBT decreases the prevalence of the most severe food insecurity among children and improves children’s nutritional outcomes.²⁷ The Biden-Harris Administration continues to support an expansion of Summer-EBT so children can access nourishing meals when school is not in session.
- **Expand SNAP eligibility to additional underserved populations.** SNAP is a proven intervention to address food insecurity; however, not everyone who has income low enough to qualify for the program is eligible. For example, federal law currently prohibits

many formerly incarcerated individuals—a number of whom are parents of young children—from accessing SNAP benefits, jeopardizing their health and making it more likely they will struggle to successfully re-enter society and avoid re-offending.²⁸ This restriction disproportionately impacts Black individuals.²⁹ The Biden-Harris Administration will work with Congress to eliminate this prohibition. In addition, the current two-tiered structure for nutrition assistance does not provide equitable benefits to the territories. The Administration supports granting territories the option to transition from current block grants to SNAP. Additionally, rather than reducing barriers to employment, research demonstrates that time limits on SNAP eligibility amplify existing inequities in food and economic security. And, SNAP’s college student eligibility restrictions are out of date given the current population who seek higher education credentials, many of whom are older, have low income, and hold caregiving responsibilities. Other vulnerable populations such as youth who aged out of foster care and families providing kinship care, could also benefit from expanded access to nutrition benefits. The Biden-Harris Administration will work with Congress to expand access to this vital program.

- **Increase funding for the Older Americans Act (OAA) nutrition programs.** Older adults experience unique health, social, and nutrition challenges such as decreased mobility and limited shopping and cooking ability. The Biden-Harris Administration will work with Congress to increase funding for OAA nutrition programs, which play a vital role in helping older adults remain healthy and independent.
- **Make it easier for eligible individuals to access federal food, human services, and health assistance programs such as SNAP, WIC, and Medicaid.** Too often, people are eligible for federal assistance programs but do not benefit from them. To further facilitate participation in federal assistance programs:
 - USDA will work with the Department of Health and Human Services (HHS) to help states identify individuals enrolled in one program who appear eligible for others but are not yet enrolled. For example, states could work to inform pregnant women and parents of young children enrolled in Medicaid and/or SNAP but who are not participating in WIC about WIC services.
 - USDA will advance the WIC Modernization strategy to invest in community-based outreach, streamline the participant experience, improve the in-store experience, expand access to farmer’s markets, and increase diversity and cultural competency in the WIC workforce.
 - USDA will partner with the Department of Education (ED), Social Security Administration (SSA), and other agencies to increase outreach and awareness of SNAP, including to eligible college students, older adults, and individuals with disabilities. For example, USDA and ED will establish a Memorandum of Understanding (MOU) to conduct joint outreach to Pell Grant recipients and others to inform them of their potential eligibility for SNAP benefits.
 - SSA is developing a rulemaking that would discontinue Supplemental Security Income (SSI) benefit reductions based on the person’s receipt of food as in-kind support and maintenance (ISM). No longer considering food for ISM is expected to generally result in a higher SSI payment for SSI recipients who receive food support from friends or family.

- HHS Administration on Children and Families (ACF) will support outreach to families that may be eligible for SNAP and nutrition programs, and share best practices to support their enrollment by developing research, training and tools for state and community-based grantees of HHS ACF programs, including Temporary Assistance for Needy Families (TANF) and Community Services Block Grant Program (CSBG).
- HHS ACF will also issue a model application and guide to help states develop improved applications and verification processes for child care subsidies and encourage collaboration between state child care agencies and state agencies administering food and nutrition programs. Such early care and education programs are an essential source of healthy meals and services that support the growth and wellbeing of young children.
- HHS ACF will disseminate best practices on how partnerships between TANF charitable organizations and food banks can fill critical nutrition gaps for families. HHS ACF will also leverage training and technical assistance resources to highlight best practices in state and local use of TANF emergency short-term cash assistance to provide direct cash support for families experiencing acute food shortages.
- The Department of Labor (DOL) will collaborate with USDA to increase enrollment in SNAP by making referrals through DOL's American Job Centers. DOL will also disseminate best practices for how states should connect workforce and SNAP agencies to improve economic security for workers and communities.
- The Department of Veterans Affairs (VA) will connect eligible Veterans with information and SNAP enrollment assistance through VA's Transition Assistance Program and screening at VA Medical Centers and clinics.
- The Department of Housing and Urban Development (HUD) will educate its grantees on nutrition assistance programs and provide resources to promote enrollment among HUD-assisted individuals.
- **Modernize federal programs so enrolled individuals can more easily utilize benefits.** Many federal programs were established decades ago. To bring federal nutrition assistance programs into the 21st century:
 - USDA, through support from ARP funds, will expand online shopping in WIC. Online shopping is currently only being piloted in a small number of WIC state agencies. USDA will also propose to update regulations to make the SNAP online shopping program permanent and continue to add more online retailers and states to the existing program. Online shopping can expand access to healthy food and break down barriers for marginalized communities and older adults who may face discrimination or stigma, increased health risks, or have limited mobility or transportation. Additionally, SNAP participants are not currently able to use their benefits to purchase certain prepared foods, which limits choices for families shopping at SNAP-authorized retailers. And, as WIC comes up for renewal by Congress, the Administration supports addressing WIC eligibility limitations to avoid nutrition gaps during key stages of life.
 - DoD will provide clear and consistent labeling of WIC products in commissaries according to state agency program guidance. DoD will also provide beneficiaries with

online shopping and electronic payment as SNAP and WIC programs are brought online.

- **Support food sovereignty, improve access to traditional foods, and ensure Tribal communities are equitably served in federal programs.** American Indians and Alaska Natives face some of the highest rates of diet-related disease in the U.S. Yet these populations continue to face barriers to accessing and implementing federal nutrition programs. USDA made significant commitments to support food sovereignty at the White House Tribal Nations Summit in 2021.³⁰ To further support Tribal food sovereignty:
 - USDA will continue to expand the Food Distribution Program on Indian Reservations (FDPIR) Self-Determination projects, partner with Tribes on enhancements to the food package, expand the number of Indigenous and traditional foods in the Food Buying Guide for Child Nutrition Programs, and provide training and resources to school meal program operators on incorporating more Indigenous and traditional foods into school meals. USDA will also improve staff recruitment and training to ensure its workforce has the knowledge and skills to serve American Indian and Alaska Native communities.
 - The Bureau of Indian Affairs (BIA) and Bureau of Indian Education (BIE) will work to create Indigenous Food Hubs for selected BIE schools and BIA detention centers to help source Indigenous foods, enhance culturally-based healthy nutrition education, and boost training for healthy and culturally appropriate food preparation. For the first time, a nutritionist will be hired to support BIA and BIE in these efforts.
 - HHS ACF will update and expand its resource guide for Tribal communities to increase Tribes' knowledge of and access to HHS resources for food security and food sovereignty as well as physical activity.
 - HUD will promote the eligible uses of Indian Community Development Block Grant dollars to support expanding food access through the development of food banks and pantries, healthy eating habits, physical activities, and more in Tribal communities, particularly those with limited access to affordable and nutritious foods.

B. Invest in community and economic development to increase access to food.

Nearly 40 million Americans live in areas where grocery stores are not nearby.³¹ People with limited access to affordable, nutritious food tend to be lower-income and people of color. Even in communities where some retail food establishments exist, inadequate transportation and lack of affordable, healthy options contribute to food and nutrition insecurity. To further support business innovation and community and economic development with the greatest potential to advance food security, nutrition, and health, the Biden-Harris Administration will:

- **Leverage housing and other community programs to increase food access.** Strengthening food access through housing and community programs can help build broader well-being, particularly for children and families.
 - HUD will promote regulatory flexibilities that allow owners of HUD-assisted properties and Public Housing Authorities to use federal funds to renovate and maintain spaces in public housing developments to improve food access.

- HUD will, as appropriate, propose the use of Community Development Block Grants (CDBG), Section 108 loan program funding, and Choice Neighborhood funding to support food access, including to increase access to neighborhood markets, grocery stores, farmers' markets, urban gardens, food incubators, and/or the conversion of vacant buildings into food hubs, as well as case management to help residents connect with health providers. HUD will also provide technical assistance to facilitate the use of HUD and other federal funding to finance the conversion of spaces into corner market stores and the development of grocery stores in areas with limited access to affordable and nutritious foods, develop case studies to highlight best practices and, with USDA, support the development of urban agriculture programs.
- HHS ACF will issue guidance to help grant recipients maximize CSBG funds to implement or scale anti-hunger efforts, including nutrition and prepared meal programs. HHS ACF will also develop communication materials to help grant recipients maximize CSBG, TANF, and Healthy Marriage and Responsible Fatherhood funds to strengthen anti-hunger efforts; and develop a website that will disseminate case studies and best practices on anti-hunger and nutrition programs within the CSBG network.
- **Improve transportation options to and from grocery stores, farmers' markets, and commercial districts.** Improving transportation options to and from supermarkets, farmers' markets, and commercial districts increases a community's access to and options for healthy food. To support this:
 - The Department of Transportation (DOT), through implementation of the Bipartisan Infrastructure Law (BIL) and Inflation Reduction Act (IRA)—including programs such as Reconnecting Communities, Safe Streets for All, and the Neighborhood Access and Equity Grant Program—will promote transit, bicycle, and pedestrian improvements, which would support food access solutions.
 - DOT, through technical assistance, will encourage communities to engage with local and state public health experts in transportation planning and to prioritize connecting people to destinations with affordable and healthy food options.
- **Increase historically underserved communities' access to affordable and healthy foods.** Expanding food access requires sustained support and investment at the local level. To accomplish this:
 - The Federal Trade Commission (FTC) has indicated that it will vigorously enforce antitrust laws with special attention to transactions and conduct that might lead to higher prices and reduced food access in vulnerable communities. FTC will also publish a report summarizing its study conclusions on how supply chain disruptions have affected wholesale and retail markets for groceries. Independent grocery stores are more common in underserved rural and urban communities and have raised concerns they were disproportionately affected by such disruptions.
 - The Small Business Administration (SBA) will give priority in ranking to applications by organizations that benefit food and nutrition businesses in the Growth Accelerator Fund Competition (GAFC). GAFC supports the development and growth of small businesses and startup innovation ecosystems.

- The Department of Commerce (DOC), through the Minority Business Development Agency’s forthcoming Small Business Credit Initiative Technical Assistance notice of funding opportunity, will encourage applications from incubators and accelerators that support market-driven solutions to provide greater equity or access to resources to underserved communities, including food security.
- AmeriCorps will promote grant opportunities, national service, and volunteerism that address food insecurity and improve economic development in communities with critical need through its programs and special initiatives such as the AmeriCorps VISTA Food Security Initiative.
- The Delta Regional Authority will implement prioritization criteria in its grant programs to support initiatives with a direct connection between economic development and healthy food access.
- **Reduce barriers to food recovery.** One-third of all food in the U.S. goes uneaten.³² To prevent food loss and waste across the food supply chain and help ensure safe, good-quality food gets to those who need it most:
 - The Environmental Protection Agency (EPA), USDA, and HHS Food and Drug Administration (FDA) are leading development of a whole-of-government strategy for reducing food loss and waste.
 - HHS FDA will update its [Food Code](#)—which provides state, Tribal, local, and territory regulators with a model for updating their food retail and service industry regulations—to address food donation recommendations.
 - The Department of the Treasury (Treasury) will clarify the enhanced charitable deduction calculation to support businesses donating food.
- **Improve access to emergency food, including during natural disasters.** The network of emergency food providers across the country has shown its remarkable strength in recent years. The Biden-Harris Administration has taken significant steps to provide needed funding to the emergency food system, including awarding states nearly \$40 million in ARP funds to expand the reach of The Federal Emergency Food Assistance Program (TEFAP) with \$60 million in additional grants forthcoming. The Administration has also provided more than \$2.5 billion in supplemental funding for emergency food purchases. Building on this progress:
 - USDA will pursue rulemaking to improve access and equity and simplify TEFAP requirements for state and local program operators.
 - USDA will work to understand and address gaps in meeting the needs of low-income individuals and families seeking cultural foods such as identifying options and expanding access to foods suitable for kosher and halal-observant communities, to better address the foodways of individuals served.
 - FEMA will provide technical assistance to its 10 regional offices and will direct all FEMA components and senior executive leaders to focus on ensuring food security during and after disasters.
 - FEMA will integrate food security as a priority planning area by partnering with USDA in conducting outreach to state, Tribal, local, and territory partners through regional and local engagements and working with federal partners to directly support disaster-specific planning and messaging.

- FEMA will use national and regional forums to provide and coordinate an opportunity for states and localities with robust food security plans to share best practices with other jurisdictions.

Call to Action for a Whole-of-Society Response

- States and territories should increase support to struggling families through TANF cash assistance, refundable state EITC and CTCs, and other economic supports for low-income families and individuals.
- States should work across state agencies to achieve 95% cross-enrollment of eligible people across SNAP, Medicaid, and other federal programs. And, states should aim to process all SNAP applications within one week.
- State and school districts should increase investment in school food programs such as providing investments to support kitchen infrastructure and training school nutrition professionals.
- State, local, and territory governments, private sector employers, and health care companies should ensure efficient community-clinical referral systems between hospitals and outpatient clinics with community-based services, including the OAA nutrition and health promotion programs, aging and disability resource centers, and Centers for Independent Living.
- State, local, and territory governments should provide incentives and technical assistance to attract healthier food retail outlets to underserved areas, improve healthier food offerings in existing stores, and support year-round mobile produce markets in communities with limited food access.
- State, local, and territory governments should enact food waste reduction and recovery policies such as providing tax incentives to food donors.
- Philanthropy should support pilots that foster collaboration between food service programs at K-12 schools and colleges or universities in order to synergize efforts around workforce training and food procurement.
- The private sector should invest in year-round mobile produce markets and retail outlets within underserved communities.

Pillar 2—Integrate Nutrition and Health: *Prioritize the role of nutrition and food security in overall health—including disease prevention and management—and ensure that our health care system addresses the nutrition needs of all people.*

A. *Provide greater access to nutrition services to better prevent, manage, and treat diet-related diseases.*

Receiving health care to help prevent, treat, and manage diet-related diseases can optimize Americans’ well-being and reduce health care costs. However, access to and coverage for this care varies significantly. To better care for all Americans, the Biden-Harris Administration will:

- **Expand Medicare and Medicaid beneficiaries’ access to “food is medicine” interventions.** “Food is medicine” interventions—including medically tailored meals and groceries as well as produce prescriptions (fruit and vegetable prescriptions or vouchers provided by medical professionals for people with diet-related diseases or food insecurity)—can effectively treat or prevent diet-related health conditions and reduce food insecurity.³³ The Biden-Harris Administration supports legislation to create a pilot to test covering medically tailored meals for individuals in traditional Medicare who are experiencing diet-related health conditions. This proposal builds on a demonstration initiative in Medicaid, where HHS Centers for Medicare & Medicaid Services (CMS) will provide authority for states to test Medicaid coverage of additional nutrition services, and supports using Medicaid section 1115 demonstration projects. HHS CMS will also issue guidance on how states can use section 1115 demonstrations to test the expansion of coverage for these interventions.
- **Expand Medicaid beneficiaries’ access to nutrition and obesity counseling.** The Affordable Care Act (ACA) requires coverage of obesity counseling for certain patients enrolled in most private group health plans and group and individual health insurance and certain beneficiaries among the 20 million people covered under the ACA’s expansion of Medicaid. The Biden-Harris Administration supports expanding nutrition and obesity counseling coverage to millions more Medicaid beneficiaries that currently are not guaranteed access to these services, particularly in states that have not expanded coverage and which have large rural populations.
- **Expand Medicare beneficiaries’ access to nutrition and obesity counseling.** Medicare currently covers medical nutrition therapy services, including nutritional assessments and counseling, but only for people with diabetes or kidney disease, when ordered by a physician and performed by a dietitian. Medicare also covers obesity screenings and behavioral counseling to help patients with obesity lose weight, but only for patients with obesity and when performed by primary care clinicians in an office setting. The Biden-Harris Administration supports efforts to expand evidence-based nutrition and obesity counseling benefits to Medicare beneficiaries with additional conditions and to allow appropriate providers to offer obesity screening and behavioral counseling to help patients lose weight. HHS CMS will also examine existing Medicare authorities on ways to increase access to nutrition and obesity counseling. Additionally, HHS CMS will use

its provider education channels to increase awareness of Medicare coverage of nutrition and obesity counseling services.

- **Increase access to nutrition-related services through private insurance and federal programs beyond Medicare and Medicaid.** To further increase consistency in access to and coverage of quality health care services:
 - HHS CMS will solicit information from insurance plans regarding what nutrition services they already cover, with a goal of determining whether HHS CMS could strengthen essential health benefit requirements or take other actions to expand private health coverage and better address the nutritional needs of Americans.
 - DOL, HHS, and Treasury will clarify how mental health parity protections apply to coverage related to nutritional counseling for eating disorders to ensure that this coverage is not inappropriately being limited.
 - Treasury will issue guidance clarifying what nutrition and diet-related disease medical expenses can be reimbursed under health savings accounts and health flexible spending arrangements.
 - DoD will increase utilization of TRICARE’s Nutritional Therapy program to include preventive therapies and/or counseling beyond just those addressing certain diseases and conditions.
 - HHS Indian Health Services (IHS) will implement and evaluate a National Produce Prescription Pilot Program.
 - VA will implement and evaluate various food programs, including produce prescription programs, food pantries, and mobile food pantries that meet local needs and Veteran preferences.
- **Better support prevention and management of diabetes.** To help address growing rates of diabetes:
 - HHS CMS will develop a strategy to increase access to diabetes prevention and treatment services for individuals with Medicare, Medicaid, Children’s Health Insurance Program (CHIP), and Marketplace coverage. The Administration will also work with Congress to make the Medicare Diabetes Prevention Program a cost-effective permanent Medicare preventive service benefit.
 - HHS CDC will provide new funding opportunities to support the implementation of evidence-based diabetes prevention and management strategies in state and localities, with a focus on reducing health disparities.
- **Support wellness and nutritional care for children, especially those from low-income families.** HHS CDC will continue to support and expand access to the evidence-based Family Healthy Weight Programs (FHWP) through at least three new upcoming funding opportunities. FHWP supports children and their families with low income and lifestyle and behavioral changes to improve nutrition, physical activity, stress, coping, and other aspects of wellness. Additionally, HHS Administration for Community Living (ACL) will share promising practices from its University Centers for Excellence in Developmental Disabilities to help children with disabilities who require support for healthy eating. The Administration also recognizes that for children and adults with digestive and inherited metabolic disorders, ensuring access to the right types of nutritional supports, such as infant formula, can prevent hospitalizations and be

lifesaving. Still, there are often systematic barriers making access to these specialized nutritional supports challenging. CMS will evaluate coding, payment and administrative requirements in order to support access to nutritional supports for individuals with digestive and inherited metabolic disorders.

B. Screen for food insecurity and connect people to the services they need.

Social determinants of health (SDOH) can be a strong predictor of health outcomes and are a major driver of health disparities.³⁴ Incorporating SDOH such as food insecurity screenings, into health care can help practitioners better recognize the root causes that affect health, tailor care to unique individual needs, and connect patients to resources like SNAP, WIC, or a local food bank. However, food insecurity screenings are not universally conducted in the health care system, and most health care professionals have not been trained to assess it. To more fully incorporate SDOH, including food insecurity screenings and referrals, into everyday health care, the Biden-Harris Administration will:

- **Universally screen for food insecurity in federal health care systems.** Building on VA’s existing universal food insecurity screenings:
 - HHS IHS will implement a process to assess for food insecurity in the IHS user community and conduct referrals as needed.
 - DoD will screen all active-duty military for food insecurity and conduct referrals as needed.
 - HHS CMS, building on its [adoption of quality measures](#) that capture if hospitals are screening for social needs, will explore incorporating quality measures relating to screening for social needs as part of the Medicare Shared Savings Program and Medicare Advantage Star Ratings Program.
 - HHS ACL will work with Centers for Independent Living and Protection and Advocacy Systems to pilot screening for food insecurity amongst people with disabilities.
- **Incentivize payors and providers to screen for food insecurity and other SDOH.** To accelerate the work HHS CMS outlined in its [Framework for Health Equity](#):
 - HHS CMS has proposed to create new advance investment payments for certain new Medicare Shared Savings Program Accountable Care Organizations (ACO). ACOs would be permitted to use these payments to address social needs of beneficiaries, including working with local community-based organizations to address food insecurity.
 - HHS CMS will evaluate developing appropriate procedure codes to better capture services that address SDOH, including screening for food insecurity. If developed, these procedure codes could help organizations offering nutrition services more easily partner with health care providers.
 - HHS CMS will consider extending the Center for Medicare and Medicaid Innovation’s Medicare Advantage Value-Based Insurance Design (VBID) model beyond 2024 and will explore expanding its focus on supplemental benefits related to food and nutrition. HHS CMS will also consider broadening access to the model and encouraging additional Medicare Advantage Organizations to provide food and

nutrition services in their offerings under the Special Supplemental Benefits for the Chronically Ill.

- **Supporting data infrastructure for food insecurity and other SDOH screenings.** HHS CMS will continue to support efforts to develop the data infrastructure needed for food insecurity and other SDOH data elements to be captured in electronic health records and ensure interoperable health information exchange and the collection of demographic information. In addition, HHS Office of National Coordinator for Health Information Technology will promote greater adoption and use of new versions of the United States Core Data for Interoperability, which include SDOH data elements to represent SDOH assessments, problems and health concerns, and goals and interventions that can support areas such as food insecurity.
- **Incentivize hospitals to provide services focused on food insecurity and other SDOH.** The Internal Revenue Service will clarify that a non-profit hospital's spending on SDOH to address a documented community health need may meet the definitions of community benefit activities or community building activities. For example, a hospital may support food banks and pantries, conduct food insecurity screenings, fund or lead food and nutrition classes, or create a garden providing produce donations to food banks or pantries as part of its tax-exempt activities.
- **Comprehensively address food insecurity among Veterans.** VA will establish a new Office of Food Security within the Veterans Health Administration (VHA) to tackle the food insecurity rate among Veterans. The Office will provide strategic guidance and coordination within VHA, including VA hospitals and clinics, on best practices, research, and data to ensure Veterans' food security. In addition, VA will expand by 10% the amount of clinical nutrition services it provides to Veterans receiving care in the VHA.

C. Strengthen and diversify the nutrition workforce.

The health care workforce, including registered dietitian nutritionists (RDNs), plays a central role in preventing, treating, and managing diet-related diseases. However, patients are less likely to seek care or share information if they perceive ethnic or social differences with their health care providers.³⁵ Thus, a more diverse health care workforce would better serve communities of color, which suffer from higher rates of food insecurity and diet-related disease. To expand and create a more diverse workforce well-trained in nutrition, the Biden-Harris Administration will:

- **Bolster the health care workforce, including nutrition professionals, and ensure other medical professionals receive nutrition education.** Currently, 70% of RDNs are White. Only 6% of RDNs indicate Hispanic or Latino heritage, 6% indicate being Asian, 3% indicate being Black, and 1% indicate being Indian or Alaska Native.³⁶ Increasing the diversity of RDNs and expanding their reach to areas with limited care will ensure more equitable care for everyone.
 - HHS Health Resources and Services Administration, through its Maternal and Child Health Nutrition Training Program, will train over 4,500 future nutrition professionals and over 30,000 practicing professionals over the next five years on key topics such as pediatric obesity prevention, household food security, and nutrition during pregnancy. Beginning in 2023, the program will partner with Minority Serving

- Institutions (MSIs) and Historically Black Colleges and Universities (HBCUs) to recruit and train nutrition professionals from underrepresented groups.
- VA will develop pilots for [SkillBridge](#) to facilitate hiring of transitioning service members into VA Nutrition and Food Services positions. VA Nutrition and Food Services will partner with the Military Spouses Employment Program to facilitate hiring of military spouses into these positions. Additionally, VA will conduct a pilot for professional development of food service workers to encourage recruitment and retention for those positions.
 - VA will expand [internship](#) and rotation opportunities for dietetic interns and assess revisions to the Qualification Standard for Dietitians to increase the number of opportunities for internship directors.
 - USDA will work with Land-Grant Universities to develop a national workforce strategy for WIC, which could help shape the integration of diversity, equity, inclusion, and accessibility principles across the broader nutrition education workforce.

Call to Action for a Whole-of-Society Response

- States should leverage all available federal authorities to expand coverage of “food is medicine” interventions.
- States should collaborate with non-profit or community-based organizations to establish a state-funded produce prescription program for low-income individuals and families.
- State, local, and territory governments should integrate nutrition experts into their health departments and modernize scope of practice laws, as applicable, to allow qualified health care professionals to play a larger role in disease prevention and management efforts.
- Health insurance companies should consider providing or expanding coverage of nutrition services, including produce prescriptions and/or medically tailored meals for target populations.
- Hospitals, clinics, and health centers should implement programs leveraging federally supported open industry technology standards that address SDOH such as screening patients for food insecurity, connecting patients to nutrition assistance services, and ensuring services are available.
- Health professional schools (e.g., medical, dental, pharmacy, nursing, social work, public health, physician’s assistants, physiology, exercise science, etc.) and licensing boards should expand nutrition education in graduate medical education curriculums, board exams, and post-graduate training.

Pillar 3—Empower All Consumers to Make and Have Access to Healthy Choices: *Foster environments that enable all people to easily make informed, healthy choices, increase access to healthy food, encourage healthy workplace and school policies, and invest in public education campaigns that are culturally appropriate and resonate with specific communities.*

A. Empower consumers with updated and more accessible food labeling.

Food labels help consumers identify healthy foods when grocery shopping. Most consumers are familiar with the iconic Nutrition Facts label, which the FDA recently updated with a refreshed design and additional information such as added sugars.³⁷ But, consumers may not always understand information on food labels or have access to it when shopping online. To empower consumers to make healthy choices, the Biden-Harris Administration will:

- **Develop a front-of-package (FOP) labeling system to quickly and easily communicate nutrition information.** FOP labeling systems—such as star ratings or traffic light schemes—can promote equitable access to nutrition information and healthier choices and could also prompt industry to reformulate foods to be healthier.³⁸ HHS FDA will conduct research and propose developing a standardized FOP labeling system for food packages to help consumers, particularly those with lower nutrition literacy, quickly and easily identify foods that are part of a healthy eating pattern.
- **Make sure that foods labeled as “healthy” align with current nutrition science and the *Dietary Guidelines for Americans*.** HHS FDA will propose updating the nutrition standards for when companies use the “healthy” claim on their products and develop a symbol companies may use to depict the “healthy” claim on food packages. HHS FDA will also develop guidance for industry on the use of Dietary Guidance Statements on food labels to help people understand how a food or food group can contribute to a healthy eating pattern.
- **Adequately fund HHS FDA’s Center for Food Safety and Applied Nutrition (CFSAN) to prioritize its nutrition and labeling work.** HHS FDA’s CFSAN nutrition work has historically been underfunded in comparison to other priority areas. To date, only 7% of CFSAN’s budget supports nutrition and labeling work, yet CFSAN is responsible for the safety and labeling of approximately 80% of the U.S. food supply. The Biden-Harris Administration will work with Congress to ensure CFSAN has the resources it needs to accomplish its critical work.
- **Facilitate making nutrition information easily available when grocery shopping online.** While consumers increasingly use e-commerce to shop for groceries, nutrition information is not uniformly presented or always made easily accessible. HHS FDA will publish a request for information to gather public input regarding industry practices, technology, and current challenges to inform guidance for the food industry on nutrition, ingredient, and allergen information that should be available for groceries sold online.

B. Create healthier food environments and a healthier food supply so the healthier choice is the easier choice.

A key barrier to healthy eating is lack of access to nutritious food. The food environment (e.g., proximity to stores, food prices, available food options) influences a person’s food choices and diet quality. The U.S. food supply contains an overabundance of sodium, added sugar, and saturated fat. Americans who want to consume less sodium, added sugars, and saturated fat may have a difficult time doing so because of poor availability of healthy alternatives.³⁹ Recognizing the power of creating healthier food environments, the Biden-Harris Administration will:

- **Expand incentives for fruits and vegetables in SNAP.** Incentives in SNAP to support purchasing more fruits and vegetables have been pilot tested and shown to be effective in Massachusetts and through the USDA [Gus Schumacher Nutrition Incentive Program](#). To increase access to fruits and vegetables for SNAP recipients, the Biden-Harris Administration will work with Congress to increase the reach and impact of incentives for fruits and vegetables in SNAP.
- **Facilitate lowering the sodium content of food.** In 2021, HHS FDA issued voluntary, short-term (2.5-year) sodium reduction targets for a broad range of processed, packaged, and prepared foods to help reduce the amount of sodium in the U.S. food supply.⁴⁰ To further lower sodium consumption:
 - HHS FDA will issue revised, voluntary sodium reduction targets to facilitate continually lowering the amount of sodium in the food supply beyond the 2021 targets.
 - HHS FDA will propose to update regulations to enable manufacturers to use salt substitutes in [standardized](#) foods to support sodium reduction.
 - VA will increase lower-sodium foods with regards to procurement.
 - HHS ACL and FDA will partner to provide technical assistance to help align older adult nutrition programs with HHS FDA’s voluntary sodium targets.
 - USDA will continue work to reduce sodium in school meals consistent with the goals of the *Dietary Guidelines for Americans* and HHS FDA’s voluntary sodium targets.
- **Facilitate lowering added sugar consumption.** The U.S. has reduced added sugar consumption and established a regulatory definition for added sugars. Since 2021, added sugars must be declared on the Nutrition Facts label for most products. Despite this progress, intake of added sugars is still too high for most Americans. HHS FDA will begin assessing the evidence base for further strategies to reduce added sugar consumption, collaborating with other HHS divisions and USDA to hold a public meeting regarding future steps the federal government could take to reduce intake of added sugars such as developing targets for categories of foods, similar to the voluntary targets FDA developed for sodium.
- **Expand access to healthier environments in federal facilities.** Implementing and updating the Federal Food Service Guidelines in federal facilities will promote fruits, vegetables, whole grains, low-fat dairy, and low sodium options; increase the availability of healthy beverage choices as well as plant-based options; and encourage healthy choices through behavioral design. Millions of federal employees and other people who access government facilities—from National Parks to VA hospitals—will benefit. To

further support healthy environments, DoD will work with CDC to enhance nutrition and physical activity standards in all DoD child development programs. The General Services Administration (GSA) will promote nutrition and physical activity at its child care centers and DoD will also increase healthy options served in its dining facilities and vending machines, including expanding its Go 4 Green program (joint-service performance-nutrition initiative that improves where military service members live and work).

- **Address marketing of unhealthy foods and beverages.** Food, beverage, and restaurant companies spend nearly \$14 billion per year on marketing in the U.S. More than 80% of this advertising promotes fast food, sugary drinks, candy, and unhealthy snacks that are high in sodium, added sugars, and/or saturated fat.⁴¹ Companies also use a wide variety of highly effective techniques to target sales of unhealthy foods to adolescents and children, particularly Black and Hispanic children.⁴² The Administration will pursue steps to address the marketing of unhealthy foods, including:
 - DoD will limit marketing in military dining facilities to those that meet its [Go 4 Green](#) program nutrition standards.
 - The FTC has indicated that it will pursue targeted law enforcement actions to prevent the deceptive advertising of foods and dietary supplements, including deceptive advertising that might be targeted to youth.
- **Leverage federal nutrition assistance programs to promote healthy habits.** USDA's Child Nutrition Programs and WIC can help increase diet quality of beneficiaries and spur companies to reformulate food products. To further this work:
 - USDA will propose updating the package of foods offered by WIC and the nutrition standards in school meals to better align with the most recent *Dietary Guidelines for Americans* and provide enhanced technical assistance and best practices to support schools in meeting the standards. Building on the success of the ARP's temporary increase, through appropriations, USDA will also continue providing the cash value benefit in WIC at a level that supports fruit and vegetable access and recommended consumption.
 - USDA will advance a new Healthy Meals Incentive initiative—supported by ARP funding—to support schools' efforts to improve the nutritional quality of school meals. This initiative will challenge all players within the K-12 food supply chain to increase the availability of and access to healthy offerings, recognize School Food Authorities (SFAs) that are innovating in offering nutritious school meals, and provide funding to small and/or rural SFAs to improve the nutritional content of meals offered through the Child Nutrition Programs.
 - USDA will update nutrition criteria in [USDA Foods](#) procurement specifications to align with HHS FDA's voluntary sodium targets and consider the inclusion of added sugars limits. Additionally, USDA will work to ensure that food served in the Child and Adult Care Food Program (CACFP) and the Summer Food Service Program (SFSP) aligns with the *Dietary Guidelines for Americans* wherever feasible.
- **Create healthier food retail, restaurant, and college campus environments.** Modifying the food environment to increase the availability of healthy foods can improve people's eating patterns.⁴³

- The Administration will work with Congress to remove the appropriations rider currently barring USDA from setting stronger standards for SNAP retailers to stock a variety of healthy foods as a basic requirement to participate as a SNAP store.
- HHS ACL will issue an OAA nutrition program-restaurant partnership best practices report. These partnerships enhance the nutritional quality of restaurant offerings, as meals served in OAA programs must align with the *Dietary Guidelines for Americans*.
- ED will send a Dear Colleague Letter encouraging higher education institutions to be conscientious about nutrition. ED will use the letter to call on institutions to procure healthier foods and encourage them to use ARP funds for food pantries. ED will also encourage institutions to work with community organizations to provide services to students and promote nutrition security by showcasing best practices and examples from the field.
- **Increase access to local food to better connect people to nutritious foods.** Sourcing local foods can help increase consumption of fruits, vegetables, and other under consumed foods, improve attitudes about healthy eating, and support local economies.
 - HUD and USDA will cross-promote their programs to the owners of HUD-assisted properties and incentivize Public Housing Authorities to implement urban agriculture projects, food banks, and summer meal programs in affordable housing developments.
 - USDA will partner with EPA to provide technical assistance to their *Local Foods, Local Places* recipients to help cities and towns as they develop local food systems.
 - USDA will establish Regional Food Business Centers to support local food business growth, particularly in support of underserved communities including in Appalachia, Colonias, and the Mississippi Delta and throughout Tribal communities.
 - USDA will work to strengthen and diversify the suppliers that provide healthy, nutritious, and local foods to schools and nutrition assistance programs by assisting small and underserved farmers and businesses to become vendors for school meals.
 - USDA will make investments to support local and regional food and farm businesses through grants and other financial assistance for food hubs, distribution, and processing as well as technical assistance particularly in support of underserved communities to provide nutritious food to schools, food banks, and other nutrition assistance programs.
 - The Appalachian Regional Commission will work with USDA to improve access to federal funding in Appalachian communities seeking to enhance access to local foods.
 - The Northern Border Regional Commission will provide guidance for grantmaking to support access to locally produced foods through its State Economic & Infrastructure Development Program.
 - DoD and VA will expand their procurement of local foods for military and Veterans' care facilities.
 - The Bureau of Prisons (BOP) will partner with USDA to increase procurement of local foods in federal prisons. BOP will also identify additional facilities that could support gardening programs where incarcerated people grow and harvest produce that is donated to local food banks.

- **Expand breastfeeding support and counseling for mothers.** Parents who choose to breastfeed continue to face substantial barriers in sustaining this choice, including inconsistent hospital practices, lack of insurance coverage, and inadequate access to paid parental leave. Building on the Biden-Harris Administration’s [Maternal Health Blueprint](#):
 - USDA is testing telehealth initiatives to facilitate virtual breastfeeding support and one-on-one counseling in WIC. USDA will also disseminate results and key findings from an evaluation of a national breastfeeding support campaign it is conducting in partnership with the University of Nevada, Reno. USDA will also translate training materials and the WIC Breastfeeding Support website into Spanish.
 - HHS will lead the second phase of the Reducing Disparities in Breastfeeding Challenge, which awards successful programs that have proven outcomes to improve breastfeeding rates and reduce disparities.
 - HHS and DOL will work to ensure that the ACA requirements for coverage of breastfeeding support and counseling without cost sharing in most private health insurance plans and Medicaid are fully implemented and enforced.
 - DOL will take steps to ensure nursing workers and their employers are aware of and understand their rights and responsibilities through a series of online webinars at the national level, followed by locally focused webinars to reach workers, advocates, and employers throughout the country.
 - The Biden-Harris Administration will continue to support extending workplace protections to breastfeeding mothers.

C. Support robust and tailored nutrition education.

Consumers often hear conflicting food messages and U.S. adults generally overrate the quality of their diet,⁴⁴ suggesting that additional work is needed to ensure adults are empowered to eat healthy foods. To bolster nutrition education, the Biden-Harris Administration will:

- **Support regular updates to the *Dietary Guidelines for Americans* and carry out a national education campaign.** The *Dietary Guidelines for Americans* is the cornerstone of all federal nutrition programs and policies, providing science-based recommendations for healthy eating. The Biden-Harris Administration will work with Congress to provide adequate funding for HHS to regularly update these guidelines, in partnership with USDA, and lead a national education campaign to boost awareness of healthy eating recommendations and support all Americans in making healthy choices.
- **Develop tailored nutrition education.** Education related to healthy eating is even more effective when it is grounded in cultural understanding. Building on currently available tailored education materials:
 - USDA will develop [MyPlate](#) nutrition education materials that are culturally appropriate and translated into a variety of languages.
 - USDA will work with Tribal leaders to expand nutrition education services and programs in FDPIR.
 - HHS ACL’s [Nutrition and Aging Resource Center](#) will greatly expand ready-to-use, virtual, and in-person nutrition education for older adults.

- HHS FDA will develop messaging and materials about its food labeling efforts that are tailored and disseminated appropriately for various audiences.
- HHS ACF, in consultation with the Substance Abuse and Mental Health Services Administration and Office of the Assistant Secretary for Health, will integrate nutrition counseling and access into direct service grant programs for victims of human trafficking, including integrating nutrition into national virtual training.
- BOP will support the health of inmates and their families by adding a curriculum module to address dietary needs for vulnerable populations in its Culinary Arts vocational program; develop Life Skills Laboratories to teach balanced nutrition, healthy eating, and hands-on food preparation skills to individuals who have cognitive or physical impairments; develop a new standardized wellness program; develop resources focused on health and nutrition to provide to children while they wait to enter visitation; and expand its annual health fairs to reach a larger audience.
- **Leverage SNAP-Ed to promote healthy foods.** Many state SNAP-Ed programs use advertisements or social marketing to promote healthy foods and beverages. To leverage this resource, USDA will promote MyPlate's Shop Simple digital tool to assist users in finding healthy and affordable foods. USDA will also refresh and expand SNAP-Ed Connection, a database of nutrition education and physical activity resources.

Call to Action for a Whole-of-Society Response

- States should provide nutrition incentives to SNAP participants to purchase healthy food such as increasing the purchasing power of SNAP beneficiaries at farmers markets, and encourage retailers to market more nutritious food in store and online.
- State, local, and territory governments should adopt federal food service guidelines in their municipal buildings and advance measures to prohibit coupons or sales of unhealthy foods and beverages.
- States and localities should adopt early care and education licensing regulations that require minimum nutrition and physical activity standards that all licensed child care providers follow, regardless of program participation, and ensure early education and care workers are paid an adequate wage.
- States, localities, and K-12 schools should consider incorporating culinary arts and nutrition education into schools.
- OAA nutrition programs and Centers for Independent Living should expand creative service models by partnering with restaurants, grocery stores, food trucks, and local farmers to promote nutritious meals and use of locally-sourced foods.
- Colleges and universities should update their procurement contracts to ensure healthier foods are available in dining halls, including through sourcing local foods.
- Philanthropy should support pilots in underserved communities—including Tribal communities, rural, and Native Hawaiian communities—that boost local food systems as an

economic driver in communities by fostering connections between farmers who are growing culturally appropriate food, food vendors, institutions, and community organizations.

- The food industry should increase the availability of and access to foods that are low in sodium and added sugars—including foods meeting or exceeding FDA’s voluntary sodium reduction targets—and high in whole grains, particularly for the K-12 market.
- Food retailers should hire RDNs to help provide nutrition information to consumers, redesign stores to more prominently place healthier choices, market and stock healthier items, and establish buying programs with local farms.
- Online grocery companies should redesign their search algorithms to ensure healthier products appear first and include ingredient and Nutrition Facts label information in an accessible manner for all food products sold online.

Pillar 4—Support Physical Activity for All: *Make it easier for people to be more physically active—in part by ensuring that everyone has access to safe places to be active—increase awareness of the benefits of physical activity, and conduct research on and measure physical activity.*

A. *Build environments that promote physical activity.*

One of the most impactful ways that people of all ages can improve their health is by being more physically active. Yet, the vast majority of Americans do not meet the *Physical Activity Guidelines for Americans*.⁴⁵ Personal efforts to be physically active can be made easier or harder by the surrounding environment. For example, individuals may not know about or have access to, safe places to be physically active, or have chronic conditions or physical limitations that create additional barriers. To make physical activity easier for all, the Biden-Harris Administration will:

- **Expand HHS CDC’s State Physical Activity and Nutrition Programs (SPAN) to all states and territories to implement successful state and community-level policies and activities for physical activity.** Through SPAN, HHS CDC works with states to implement evidence-based strategies to reduce chronic disease by improving physical activity and nutrition. In particular, through SPAN, the Active People, Healthy Nation initiative makes physical activity safe and accessible for all by implementing state and community-level policies and activities that connect pedestrian, bicycle, or transit opportunities to everyday destinations. However, HHS CDC currently only has funding to deploy SPAN in 16 states. The Biden-Harris Administration will work with Congress to provide additional funding to expand SPAN nationwide.
- **Connect more people to parks, particularly in nature-deprived communities.** People who have access to green environments such as parks and trails, tend to walk and be more physically active than those with limited access. But, less than half of people in the U.S. live within half a mile of a park.⁴⁶ As part of the President’s America the Beautiful Initiative, the Biden-Harris Administration is working to create more parks, open spaces, and safe outdoor opportunities in nature-deprived communities. As part of this effort:

- The Biden-Harris Administration will work to expand the National Park Service’s (NPS) efforts to identify places where municipal transit or alternative modes of transportation are unavailable between parks and nearby underserved or disadvantaged communities. In partnership with DOT, NPS will deploy existing tools that improve trip planning and convenient connections to promote car-free travel to parks. This work will focus on lower-income, diverse, and underserved communities.
- Federal agencies, including DOT, Department of Interior (DOI), and EPA, will sign a Nature-Deprived MOU to collaborate on work to reduce the number of people without access to parks and nature in their communities.
- The Federal Interagency Council on Outdoor Recreation will work to increase access to national public lands, including through the Every Kid Outdoors (EKO) program. EKO provides fourth-grade students and their families, free one-year admission passes to over 2,000 federal lands and waters.
- **Promote active transportation and land use policies to support physical activity.** Active transportation—such as walking and biking—is one of the leading strategies to increase physical activity.⁴⁷ Communities and transportation systems can be designed to make active transportation safer and more enjoyable. Through BIL, the Biden-Harris Administration is improving transportation—including active transportation—for communities that have faced disinvestment in infrastructure. Additionally, the IRA established a new Neighborhood Access and Equity Grant Program that will fund projects to restore walkability and access, including to parks, in historically disadvantaged communities. Building on this work:
 - DOT will provide additional technical support and guidance for regional and local transportation agencies, transit authorities, industry, non-profits, community groups, and others working on transportation projects focused on prioritizing active transportation safety for all people using streets (including people walking, biking, and rolling), beginning with a web portal and research projects that will be publicly available Fall 2022.
 - DOT will develop guidance and/or process changes that will help recipients of federal aid prioritize the safety of all people using streets (including people walking, biking, and rolling) in transportation network planning, design, construction, and operations, including in small towns and rural areas.
 - DOT will issue guidance clarifying how modes other than motor vehicles should be considered in the planning and design process of roadways.
- **Support physical activity among children both in and out of school.** Physical activity contributes to children’s overall physical and cognitive health, including improved academic performance; yet, fewer than one quarter of children ages 6-17 years old achieve recommended amounts.⁴⁸ Physical activity and nutrition are parts of comprehensive whole-child approaches to education that build healthy children and supportive learning environments.
 - ED will provide guidance to states and school districts on how they can use funds under the Bipartisan Safer Communities Act grants and ARP funds to support physical activity for children.

- ED will, through the *Engage Every Student Initiative*, promote strategies for increasing participation in physical fitness programs and for incorporating physical activity in summer learning and engagement and after-school programs.
- HHS CDC and ED will partner to support districts in implementing a framework for planning and organizing activities for physical education and activities in schools.
- HHS ACF will scale efforts to help educators add activities tailored for children to their daily routine that increase quality physical movement and teach children about healthy food choices.

B. Support robust and tailored physical activity education and promotion.

Along with building environments that support and prompt more physical activity, it is important to increase awareness of the benefits of physical activity and offer tips to help people move more. However, many people do not know the recommended amounts of physical activity. To empower Americans to be more active, the Biden-Harris Administration will:

- **Support regular updates to the *Physical Activity Guidelines for Americans* and increase awareness of the importance of physical activity.** Only 22% of people are aware of the federal government’s *Physical Activity Guidelines for Americans*.⁴⁹ These guidelines provide information on the amounts and types of physical activity necessary to become and stay healthy. HHS promotes the guidelines through the Move Your Way® campaign, but funding to support the *Physical Activity Guidelines for Americans* and the Move Your Way® campaign has not been consistent. The Biden-Harris Administration will work with Congress and private sector actors to provide funding to support both the *Physical Activity Guidelines for Americans* and Move Your Way®.
- **Tailor physical activity messages to resonate with specific demographic groups.** Education is most effective when messages and tactics are tailored to specific audiences. Yet, most physical activity campaigns fail to target specific demographic groups.⁵⁰ To create more tailored physical activity messages:
 - HHS will release evidence-based strategies to increase physical activity among older adults.
 - HHS IHS will update its Physical Activity Toolkit and re-ignite the Just Move It program designed to help Indigenous people move more.
 - BOP will enhance its vocational training program to teach inmates to develop individualized exercise and nutrition plans for those who are at-risk for or who currently have diet-related diseases.
 - BOP will launch a new program, “Women’s Life Skills,” which includes nutrition and physical activity sessions designed for women who may have limited experience with independent living or a physical or mental disability. This program will be available to all women in BOP facilities.
- **Facilitate physical activity in federal facilities.** To serve as a model employer, GSA will reinvigorate the Consider the Stairs campaign in all federal facilities through new signage to encourage employees to take the stairs instead of elevators. GSA will also post

best practices from the campaign to GSA’s website to encourage other employers to adopt this concept.

Call to Action for a Whole-of-Society Response

- State, local, and territory governments should adopt jurisdiction-wide plans and proclamations to promote CDC’s Active People, Healthy Nation as well as adopt and implement Complete Streets policies and Safe Routes to School programs.
- State governments should offer free passes for children and/or families to state parks.
- State, local, and territory governments should increase accessibility for community members with disabilities to exercise at local parks or workout facilities.
- State governments should consider establishing and monitoring implementation of more rigorous physical education requirements in schools to meet or exceed the *Physical Activity Guidelines for Americans*’ recommendations for children and adolescents.
- Correctional facilities should provide opportunities for exercise for persons in custody.
- Employers should encourage physical activity in the workplace, including by promoting the use of stairs instead of elevators and active modes of transportation to work, and by providing access to spaces to be physically active at work.
- City bike share companies should subsidize their membership costs for individuals with lower incomes.
- The private sector should invest in building parks and safe sidewalks in underserved neighborhoods.
- The private sector, non-profits, and local governments should work together to create shared-use agreements to make open spaces, sports facilities, and fields open to schools.

Pillar 5—Enhance Nutrition and Food Security Research: *Improve nutrition metrics, data collection, and research to inform nutrition and food security policy, particularly on issues of equity, access, and disparities.*

The Biden-Harris Administration is committed to developing innovative, inclusive, impactful, and science-based, policy solutions to address nutrition and food insecurity. The federal government spends approximately \$2 billion on nutrition research each year, primarily through HHS National Institutes of Health (NIH). However, there are still gaps in the scientific understanding of nutrition and health. To expand nutrition, health, and food security research efforts and ensure equitable opportunity for marginalized groups to realize the benefits of research, the Biden-Harris Administration will:

- **Bolster nutrition research funding to support evidence-based policies.** Adequate funding and staff are needed to effectively conduct consistent and innovative nutrition research. For example, the Dietary Reference Intakes (DRIs) are a set of values used to plan and assess nutrient intakes in the U.S. DRIs are widely used in evaluation research, development of dietary guidance, population surveillance, program assessment, and consumer education—yet funding to update them regularly is inconsistent and insufficient.
- **Implement a coordinated federal vision for advancing nutrition science.** The Administration will increase collaboration across nutrition science and research priorities to identify the research and data needs that are most likely to make a meaningful impact on food security and nutrition. Working with external scientific experts, the Interagency Committee on Human Nutrition Research, and the White House Office of Science and Technology Policy (OSTP), the President’s Council of Advisors on Science & Technology (PCAST) will identify scientific opportunities, gaps, and priorities to continue to advance nutrition science, with a particular emphasis on ensuring equitable access to the benefits of research.
- **Ensure diversity and inclusion in nutrition, health, and food security research.** It is critical to ensure equity in research to develop effective policies and interventions that take into account the nutritional needs and cultural preferences and norms of all Americans.
 - HHS and USDA will select a 2025 Dietary Guidelines Advisory Committee (Committee) that has a diverse membership with respect to points of view, expertise, experience, education, and institutional affiliation to reflect the racial, ethnic, gender, and geographic diversity of the U.S. The Committee will review all the *Dietary Guidelines for Americans*’ scientific questions with a health equity lens to ensure that the 2025-2030 *Dietary Guidelines for Americans* is inclusive of people from diverse racial, ethnic, socioeconomic, and cultural backgrounds. The Committee will also explore whether additional examples of healthy dietary patterns should be developed and proposed based on population norms, preferences, and needs of the diverse individuals and cultural foodways within the U.S. population. HHS and USDA will also start examining best practices for adding systems approaches (considering the multiple factors that influence individuals’ dietary patterns) to the rigorous evidence review process used for developing the *Dietary Guidelines for Americans* to ensure they reflect the highest scientific integrity and contain information adaptable for public health and consumer use.
 - USDA’s Agricultural Research Service (ARS) will conduct research to more precisely define nutritional needs of American Indians and Native Alaskans. ARS will also leverage a new partnership between the Grand Forks Human Nutrition Research Center and the University of North Dakota to better understand American Indians and Native Alaskans’ diets and Indigenous foods. Additionally, ARS will expand the National Nutrient database to include reports of the concentrations of nutrients in American Indians and Native Alaskans’ foods.
 - The HHS NIH Common Fund Community Partnerships to Advance Science for Society (ComPASS) Program will catalyze, develop, and rigorously assess community-led, health equity structural interventions that leverage multisectoral

- partnerships to advance health equity. ComPASS will also develop a new health equity research model for community-led, multisectoral structural intervention research across NIH and other federal agencies.
- NPS will update its Healthy Parks, Healthy People Science Plan to add equity and access to parks among underserved populations as a specific research element.
 - The Appalachian Regional Commission will develop a research report that describes current conditions and innovative approaches to food security and food access in the Appalachian Region.
- **Expand and diversify the nutrition science workforce.** A well-trained and diverse nutrition science workforce, including researchers and educators, is critical to promote and strengthen research efforts.
 - HHS NIH will support advanced training in artificial intelligence for precision nutrition science institutional training programs.
 - HHS NIH will invest in research to develop and validate new methodologies in nutrition sciences, including leveraging mobile technologies, applying computational approaches, and using artificial intelligence and machine learning. These efforts require recruitment of trainees from a diversity of backgrounds, including those from groups historically excluded from biomedical, behavioral, and clinical research; individuals with disabilities; and individuals from disadvantaged backgrounds.
 - USDA National Institute of Food and Agriculture (NIFA) will assess its evolving research, education, and extension portfolio to determine which program areas can be utilized to impact workforce development opportunities across the agricultural and nutrition science workforces. For example, NIFA will utilize the Cooperative Extension and their connection to the Land-Grant University systems; relationships with state, Tribal, local, county, territory, and university partners; and community-based presence, as an outreach arm for reaching historically underserved populations, including HBCUs, Tribal Colleges, and Hispanic-Serving Institutions.
 - **Invest in creative new approaches to advance research regarding the prevention and treatment of diet-related diseases.** Policy interventions must be guided by knowledge of the past but also creative new approaches to accelerate scientific investigation, coordination, and translation of current and future advances. With increasing availability and lower costs of genetic sequencing technologies and artificial intelligence, now is the time to study the impacts that early life nutrition and social and environmental exposures have on healthy development and future diseases.
 - USDA Agriculture Research Service (ARS) will utilize machine learning and artificial intelligence approaches for the development of algorithms to better understand and predict interactions between food- and nutrition-related data and health outcomes. Validated biomarkers of nutrient intake and nutritional status will be identified to address personalized needs for specific foods and components.
 - HHS NIH will plan research to determine the role of diet and other early-life exposures in health and disease.
 - HHS NIH will research the interplay between nutrition, oral disease, and comprehensive health.

- HHS NIH will explore developing validated measurements and methodologies to assess 24-hour patterns of diet, physical activity, and sleep.
- **Bolster data collection to better identify trends.** Strategic decisions can be better informed with improved data on communities and/or populations that may most benefit from interventions. HHS CDC and USDA will update national data methods and infrastructure to identify trends in population intake of sodium and added sugars. USDA Economic Research Service will develop and implement a second National Household Food Acquisition and Purchase Survey as part of building and maintaining its Consumer Food Data Base.
- **Evaluate federal assistance programs and innovative models to understand impact and areas for improvement and scalability.** Continued research, evaluation, and innovation of federal assistance programs can create a strong evidence base to allow for the creation of effective programs.
 - USDA will work to more effectively measure equity within federal nutrition assistance programs, including across Tribes and among people with disabilities, and build the evidence for these programs' impact on food insecurity, nutrition, and health.
 - ED will conduct a survey to better understand how institutions addressed food insecurity among college students during the pandemic; how schools used Higher Education Emergency Relief Fund grants, including ARP funds, for food pantries; and how food insecurity persists among college students. ED will also convene institutions to lift up best practices for addressing food insecurity on college campuses.
- **Better understand the SDOH to help achieve health equity.** A better understanding of SDOH can provide vital information to inform efforts and improve health at the individual and population levels to advance health equity.
 - HHS CMS will measure social risk factors, including food insecurity, for at-risk Medicare Advantage beneficiaries.
 - HHS ACL is developing an older adult Nutrition Research Agenda that will involve federal and external partners to identify gaps in existing research regarding food insecurity, hunger, malnutrition, and behavioral health issues in order to develop a long-term framework for advancing the quality of services, establishing research priorities and creating impactful policies.
 - HUD will map USDA's Food Access Research Atlas with HUD administrative data to pinpoint areas with limited access to affordable and nutritious foods and prioritize education of HUD grantees in those areas to inform their use of HUD programs and grants.
 - HUD will partner with USDA and the Census Bureau to better understand and address persistent food insecurity among HUD-assisted individuals already connected with nutrition assistance programs.
 - HUD will include enhancing nutrition and food security research into the next HUD learning agenda for research publications.
 - DoD will conduct analysis of the root causes and impacts of food insecurity and analyze the standardized USDA measure of food security data obtained in the Status

of Forces Survey of Active Duty and Members, Survey of Active Duty Spouses, Status of Forces Survey of Reserve Component Members, and Survey of Reserve Component Spouses.

- **Research the intersection of climate change, food security, and nutrition.** Climate change has direct relevance for the future of food security and human health, altering the nutrient content of crops and increasing the risk of undernutrition, infectious diseases, respiratory illness, allergies, cardiovascular diseases, food and waterborne illness, and mental illness. Better understanding how nutrition security is interrelated with challenges and opportunities in the use of natural resources is important to ensure long-term food and nutrition security.
 - HHS will leverage the NIH Climate and Health Initiative to research the effects of climate change on food quality and nutrition security on the health of populations.
 - USDA NIFA will enter into an agreement with the National Academies of Sciences, Engineering, and Medicine to determine the links between human health and soil health by reviewing existing research on the connections between the human microbiome and soil microbiome and soil management practices and the nutrient density of foods, and identify areas for future research.

Call to Action for a Whole-of-Society Response

- State and territory governments should support nutrition and food security research at universities and colleges, including HBCUs, MSIs, and Tribal Colleges and Universities.
- State, local, and territory governments should enter into data sharing agreements with universities, think tanks, food retailers, and other entities to provide administrative data about the use of food banks, participation in after-school sports, or development of Tribal traditional food systems.
- State, local, and territory governments should invest in programs building the pipeline of researchers, particularly from communities of color, rural communities, and people with disabilities.
- Universities, colleges, and academic medical centers should bolster hunger, nutrition, and physical activity research and data collection disaggregated by factors, including race, ethnicity, and other demographic and social factors.
- Philanthropy should support research studies and efforts to bolster and diversify the nutrition science pipeline.
- The private sector should invest in robust research and development focused on nutrition, equity, and health, including research on the microbiome, immunity, diabetes, and other chronic diseases and underserved populations.

Appendix: Acknowledgments

The White House Domestic Policy Council (DPC) is deeply grateful for the commitment and dedication of the following partners:

Interagency Policy Committee: DPC thanks the 25 U.S. Government Departments and agencies and each of the components within the Executive Office of the President that are part of the IPC that helped guide this strategy. A special thanks goes to the teams at USDA and HHS who collaborated closely with DPC on planning the White House Conference on Hunger, Nutrition, and Health. DPC looks forward to continuing to work with and convene the IPC to implement and build on the national strategy.

Listening Session Participants and Support: DPC is grateful for the Cabinet members, Administration officials, and federal staff who joined the listening sessions, particularly those that facilitated the discussions and served as notetakers. Thank you to each panelist for sharing your personal story of lived experience. Your vulnerability and inspiring stories helped us better understand how to meet the needs of individuals and families living with hunger and/or diet-related diseases, and your experiences informed this strategy.

Members of Congress: DPC greatly appreciates the bipartisan support of Chairman McGovern, Senator Booker, and Senator Braun for the White House Conference on Hunger, Nutrition, and Health. DPC also recognizes and is grateful for the late Congresswoman Jackie Walorski for her unwavering commitment to ending hunger.

Stakeholders: DPC is thankful for the resounding support, input, and expertise from a diverse range of stakeholders that cut across all sectors and parts of the country. Our continued collaboration will be key to the successful implementation and long-term sustainability of the strategy. DPC looks forward to working with you in the years ahead to finally end hunger and reduce diet-related diseases and disparities in the U.S.

Appendix: Development of the Strategy

A Whole-of-Government Approach

Working across the government, the Biden-Harris Administration developed this holistic, whole-of-government approach to help change the system that allows disparities to persist and to drive transformative change to end hunger and reduce diet-related disease. The Biden-Harris Administration convened an interagency workgroup to plan and develop this strategy. The interagency workgroup includes 25 agencies and regional commissions.

- AmeriCorps
- Appalachian Regional Commission
- Delta Regional Authority
- Denali Commission
- Department of Agriculture
- Department of Commerce
- Department of Defense
- Department of Education
- Department of Health and Human Services
- Department of Housing and Urban Development
- Department of Interior
- Department of Justice
- Department of Labor
- Department of Transportation
- Department of the Treasury
- Department of Veterans Affairs
- Environmental Protection Agency
- Federal Emergency Management Agency
- Federal Trade Commission
- General Services Administration
- Northern Border Regional Commission
- Office of Personnel Management
- Small Business Administration
- Social Security Administration
- Southeast Crescent Regional Commission

Each agency has a role to play in ending hunger and reducing diet-related diseases. An inventory of the numerous existing federal programs and initiatives related to food insecurity, nutrition, and diet-related diseases was recently included in a report to Congress.

Stakeholder Engagement

In summer 2022, the Biden-Harris Administration conducted robust stakeholder engagement as part of the process of developing this strategy, including:

- Hosting six virtual, regional listening sessions that were open to the public;
- Hosting sector-specific listening sessions for individuals with lived experience, non-profits and advocacy groups, faith-based groups, labor groups; agriculture groups, health care groups; private sector companies, philanthropy, civil rights groups, youth groups, Veteran and military family groups, and many more;
- Hosting a Tribal Consultation;
- Opening a portal on the White House Conference website for any individual to share their ideas and experiences with hunger and/or diet-related diseases; and
- Releasing a toolkit that stakeholders could use to host their own convenings with their networks and communities.

Anti-hunger, nutrition, and public health advocates; community organizations; state, Tribal, local, and territory governments; food businesses; health care organizations; and many others have pioneered initiatives to end hunger and improve healthy eating and physical activity. Hearing their ideas, stories, and lessons learned was critical to informing this strategy. The Biden-Harris Administration prioritized incorporating insights from people with lived experience, who are often the most impacted by historic inequities, to ensure the actions outlined in the strategy meet the needs of the people they are intended to serve.
